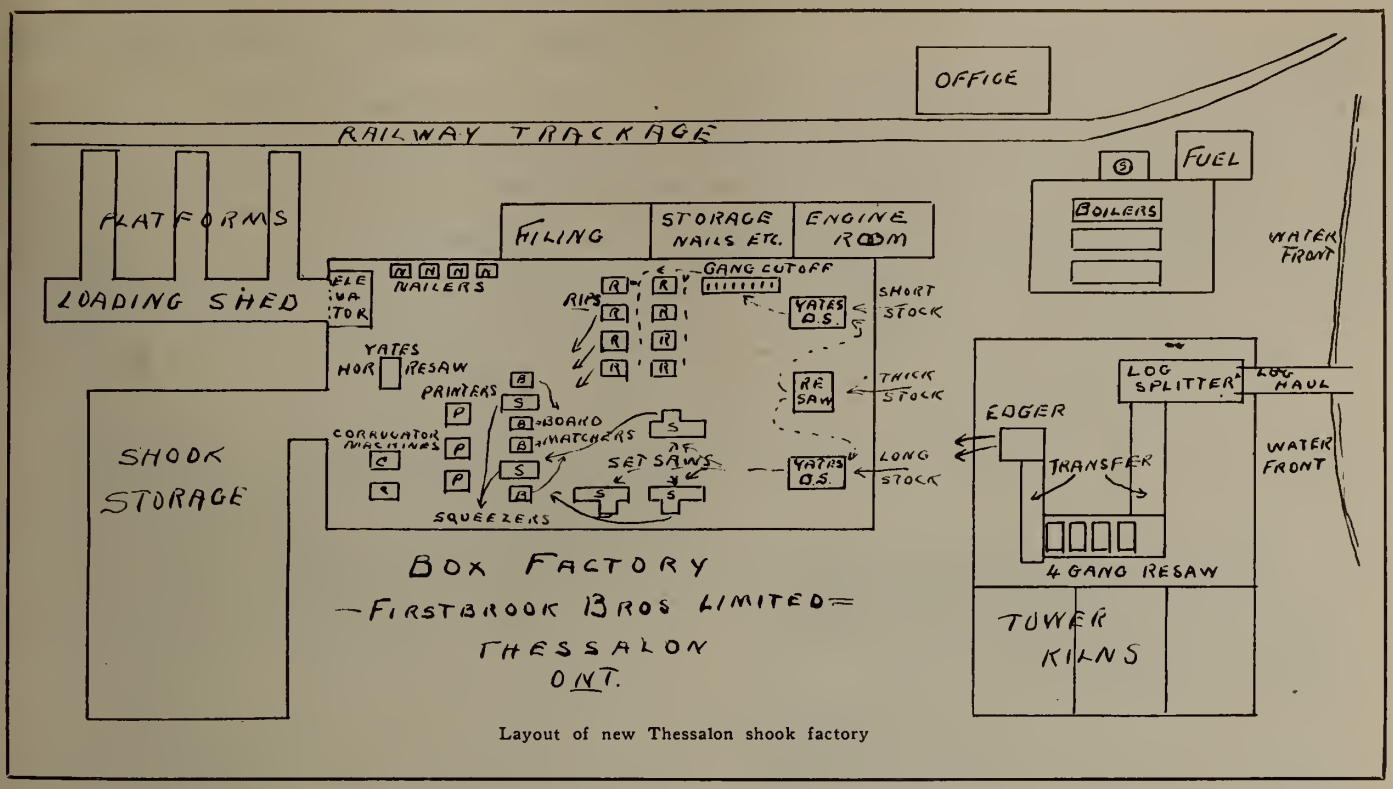
(12) In the opinion of the Inland Revenue Department, contractors ought to be able to recover tax from owners on contracts made previous to May 19th, 1920, for goods purchased or delivered after that date. This is, however, a question of law. On further contracts the tax should be provided for.

(13) Copies of all rulings made by the Department of Inland Revenue have been sent to all local collectors, and consultation with these officers will probably save much time and expense in securing information required.

Newcomer in Equipment Field

One of the newer firms in the machinery and equipment field is the General Machinery Co., 67-69 Frederick St., Toronto. The principals of this new concern are L. F. Simpson and A. L. S. McCurdy. Mr. Simpson and Mr. McCurdy have had considerable experience in the woodworking field and are familiar with all lines of woodworking equipment. Both these genlemen were in the production department of the Curtiss Aeroplanes & Motors, Limited, when that firm was manufacturing aeroplanes, and later when they turned their attention to the production of phonographs. Mr. Simpson held the position of production manager.

While not confining their efforts entirely to woodworking equipment, the greater number of machines they have in stock at present are woodworking tools. They have made arrangements to act as representatives for the Preston Woodworking Machinery Co., of Preston, Ont., and the S. A. Woods Machine Co., Boston, Mass., and are negotiating with several other American manufacturers of woodworking machines. In the iron-working line they represent the Perfect Machine Co., of Galt, Ont., Brown & Boggs and the Ford-Smith Machine Co., of Hamilton, Ont.



Layout of new Thessalon shook factory

New Box Shook Plant at Thessalon

Equipped to Handle Large Output—Number of Special Machines Installed—Adequate Supply Labor and Raw Material

A description of the Penetang plant of Firstbrook Bros. & Co. Limited, Toronto, together with a sketch showing layout of buildings and equipment, appeared in the April "Canadian Woodworker." This article pertains to the new box shook plant which the same progressive company is erecting at Thessalon, Ont.

This plant, which will be in operation shortly, will provide employment for one hundred hands and will have a capacity of about a car of finished shooks each day. While practically all the stock shipped is in k.d. form, a certain amount of nailing is done, such as cleats on ends, covers and similar work.

A quantity of trimmer block stock and mill cull lumber will be worked up, but the greater proportion of the shooks will be cut from short logs. These will be carried from the water to the log-splitting saw on a log haul-up and, after being cut, will drop on a conveyor, which will carry them to a Clark-Demil four-gang resaw. The gang resaw is a special machine and consists of four resaws up together in such a manner that the cant will pass from one to the other and four pieces will be sliced off every time that the gang re-saw will cut it into 1 in. pieces. Another transfer carries these boards to the edger where, after being sized, they are taken to the yard and piled for air-drying.

The section marked "tower kilns" was formerly part of a smelter that occupied this site. This section consists of three deep concrete storage bins and will eventually be equipped as tower kilns. The plan is to eliminate air-drying and provide sufficient heat and ventilation to dry the stock in twenty-four hours. It is not essential that the material be perfectly dry, a moisture content of 10 per cent. or 15 per cent. being permissible.

The trimmer block stock and the mill cull lumber is worked up much the same as in the Penetang plant. The short pieces are planed on a Yates double surfacer and from there go to the endless bed gang trim-saw. This latter machine has eight or ten adjustable cut-off saws, which are set to cut sides and ends. The stock is placed on the bed so that it will be worked up with a minimum of waste. The short pieces are now ripped to width, matched and trimmed and the other operations proceeded with.

The longer or mill cull lumber is double surfaced on another Yates machine and cut to length and ripped on combination sets of saws. The succeeding operations depend entirely on the type and size of box being made.

The gang cut-off saw, the combination cut-off and rip saw sets and the gang resaw are all special machines; in fact the gang cut-off and the combination saws were designed and constructed under the supervision of the superintendent, Mr. Benson. The gang re-saw was made to their order. In this connection it might be interesting to mention that while a gang resaw is being manufactured and distributed at the present time, this machine was first made to their order and it is understood that they had the first one in operation on this continent.

The balance of the equipment includes such machines as two Yates double surfacers, Yates resaw, Yates horizontal resaw, four Morgan nailers, three Morgan boxboard printers, two Morgan corrugator driving machines, four boxboard matchers, two box-

board squeezers numerous rip saws and a full complement of small machines.

Thessalon should be a good location for a plant of this kind. The labor situation is very good, there being a plentiful supply of skilled and semi-skilled workmen. Being situated in the heart of a lumbering district, the raw material situation should not give any worry for many years to come. Considering the raw material and labor situation and the adequate trackage and waterfront facilities, which exist there, the location might well be called an ideal one.

Demand for Ply Wood Boxes

Trade Commissioner J. W. Ross

A very large demand exists in China, the Straits Settlements, Java, Ceylon and India for boxes in which to ship away the various export products of those countries, principally tea and rubber.

These boxes, of which the accompanying photograph is an accurate illustration, are made of lominated or ply wood (3 ply), the size is 19-inch by 19-inch by 24-inch, and thus measure 5 cubic feet, and are made to contain 200 pounds of sheet rubber, or 160 pounds of crepe rubber.

Such boxes are now being made locally in Java, and are furnished complete with sheet iron corners, as seen loosely placed upon the corners of the box in the photograph. Their cost in guilders $3.25 each, or about $1.25 United States currency. I have received an inquiry from one firm for 50,000 of these boxes, but the demand from the Straits Settlements, the Malay States, Java and Sumatra will greatly exceed this number; it is estimated that 4,000,000 of these cases will be required in 1920 in which to ship the season's output. This is an industry in which Canada should be in a position to compete; the above figures show the great volume to which this business has attained at the present time, but this has been reached within a comparatively short time; the future possibilities of this trade are really very great. The name of the firm enquiring for the 50,000 boxes may be secured by writing the publishers of this paper.

Conveyor belts or chains will remove the mill waste with a minimum of labor.

Wood Refuse Pays the Bill

An Extremely Economical Electric Installation In Large Box Plant

When walking through a woodworking plant you have, no doubt, noticed the 10, 15 or 20 h.p. blower that carries the sawdust and shavings to the collecting bins. Did you ever stop and consider the amount of power that blower consumes? Each plant is a particular case demanding individual attention to meet its power requirements satisfactorily. But the single large blower in the wood-shop is a feature that has often been overlooked.

One of the strongest influences that has worked against the installation of large machines, where it is possible to use several smaller ones, has been the maximum-demand rate basis of charging for electric power. Today this is the common rate used in one form or another, by the central station companies. Ordinarily, the wood-working plant is a difficult customer for the electric companies to secure because of the fact that the refuse from the wood dressing is burned in the boilers to furnish power to run and heat the plant.

One instance where the use of central-station power has been worked out to the distinct advantage of the plant is the H. R. Gibbons Box Factory, Chicago, Ill., where all of the 38 machines are driven by individual motors. None of these motors is over five horsepower, and it is due to this and one other feature that the factory is able to pay its power bill by the sale of the wood refuse.

Although the total connected horse-power of the installation is 110 horse-power, the maximum demand never runs over 45 kilowatts. There are two explanations for this. The work done is all very light. The wood is not heavy and the cuts made are short. And there is a great diversity in the use of the machines. The second explanation is to be found in the layout of the blower system for the refuse removal.

Each of the motors is hung on a wooden frame in the basement, directly under the machine that it operates. In this way no belt in the plant is over five feet long. The motor switches are mounted in steel cab-

Type of three-ply box required for shipping tea and rubber

inets on the machine, in a position that is convenient for the operator.

Electrically, the installation is exceptionally economical. And its convenience makes it possible for the operator to shut off his machine the instant he is through with a job. No current is wasted, and the machines are none of them over-motored. All of the saw cuts are short, so that the momentum of the two-horsepower motors on the crosscut saws and the three-horsepower motors on the rip saws is sufficient to carry the saw through a cut that might appear to demand larger motors. The actual cutting times are: eight seconds for the ripsaw and one second for the crosscut.

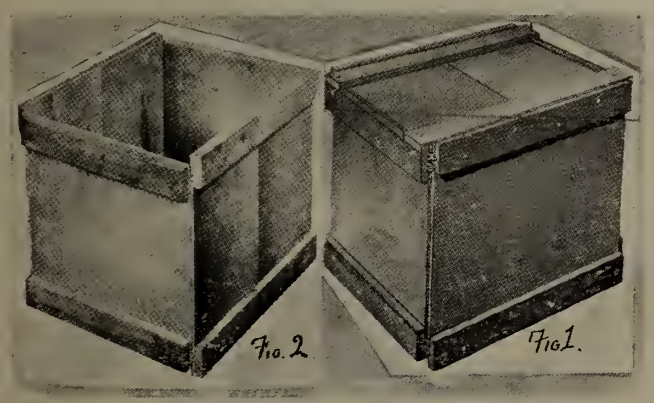
And since the crosscut and the rip-saws are always run in pairs, it is possible to use one blower for the two machines and retain the advantages of the individual-blower feature. Ths blower is belted to the twin pulley on the two-horsepower motor on the crosscut saw. The blowers, all individual, on the planer, groove saws and the hand hole cutters, are each driven by one-horsepower motors.

By using the individual blowers two purposes are served. The power consumption is cut to a minimum and the sawdust is kept separate from the shavings. It is this last fact that makes it possible to find a ready market for the refuse. It is rare that a market is found for a mixture of sawdust and shavings. The pipe from each machine carries its refuse directly to the roof. Here there is a cyclone for the sawdust and one for the shavings.

From the cyclones the refuse falls down into the hoppers that are built over the driveway. The truck can drive up under the hoppers and take on a load of clean waste of either kind. This explains how the power, used at approximately 3 cents a kilowatt-hour, is paid for by the sale of the refuse. At the same time, during the winter, enough of the waste material is burned to heat the plant.

New Hinge Corner Box

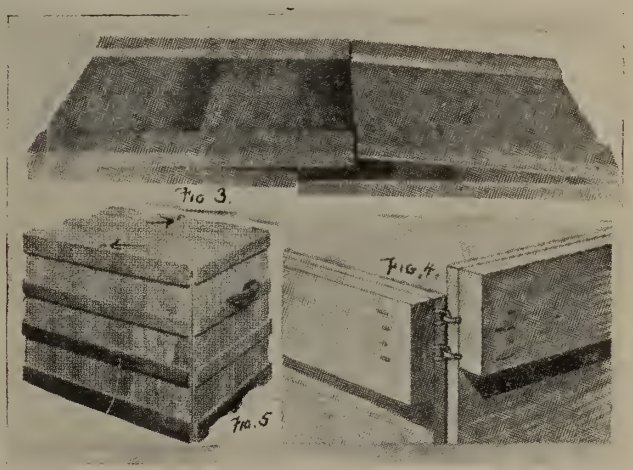
An innovation in wooden box construction is the hinge corner box which has been designed by the Chicago Mill & Lumber Co., Chicago, Ill. The unusual feature is the hinges which hold the corners together. These are made of steel wire and driven through the cleats and clinched. Naturally as these wires are hooked together when attached the cleats must be assembled as the hinges are driven and clinched.



Hinge corner box assembled

The boxes are shipped out knocked down, as shown in figure 3, the tops and bottoms being bundled separately. The sides and ends while fastened together do not take up any more space than were shooks sent out in the ordinary K. D. form. These boxes can be returned as readily as they are shipped out, and make a very desirable form of returnable box or crate—the same construction is used for crates. If instead of attaching the tops and bottoms with nails a hooked closure is used, as illustrated in figure 5, this box is particularly adapted where a returnable service is operated. The fact that it can be returned in K. D. form means a saving in freight.

When assembling the box, forms of any kind are unnecessary. The sides and ends are simply squared up as indicated in figure 3 and the tops and bottoms are nailed in place. Nails are driven through the sides into the top and through the top into the ends, giving a two way construction. It does not take as long to assemble this box and only half the number of nails are required.



Details of corner construction and box folded for shipping

Figure 1 shows the assembled box, while figure 4 is an enlarged view which gives a good idea of the details of the hinge corner. The fifth illustration is a hinge corner returnable crate. Solid or open side and end construction may be used.

In addition to the returnable feature the box is light in weight and does not take long to assemble, has a wide range of application and, due to its resiliency, will withstand a severe handling in transit. Under test it has been shown that china can be shipped in these boxes to better advantage than when packed in barrels or solid boxes.

It has proved exceptionally adaptable for packing and shipping phonographs, and many phonograph houses have placed orders for large quantities of this type of box. It is also used for shipping automobile accessories and many forms of hardware. One large Wisconsin chair manufacturer has adopted the hinge corner crate for packing and shipping his product.

Crack Filler Saves Stock

The use of some recognized make of crack filler will often enable pieces of stock with defects, defects that a few years ago would cause the pieces to be thrown out, to be worked up with a consequent saving in material. These crack fillers usually come in powder form and may be had in colors to match the different standard stains, such as mahogany, walnut, oak, etc. The powders are mixed with water to about the consistency of putty.

Machinery & Equipment

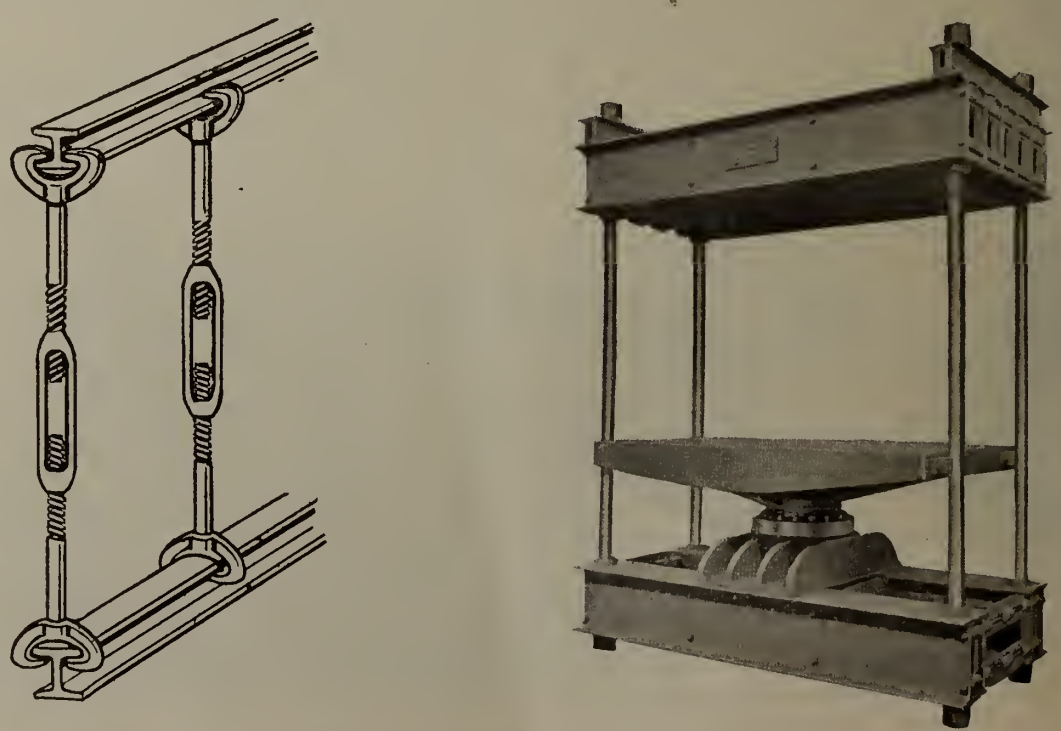
New Dominion Disc Grinder

A new addition has been made to the Dominion line of woodworking machines, manufactured by the Dominion Machinery Co., Toronto, in the shape of a disc grinder. It is designed particularly for use in pattern-making shops. Disc grinders are recognized as being almost indispensable in the modern shop. They save their cost many times over and enable the work to be done quickly and accurately. The dominion disc grinder can be furnished either with ball bearings or with the ordinary babbitt bearing. The table will tilt to an angle of 45 degrees either way and is fitted with stop for setting square with discs. The discs are turned and grooved both sides, giving four usable surfaces. A special countershaft with a pull to start and pull to stop arrangement is included. This machine can be readily adapted to metal work by using emery cloth on the disc, instead of garnet paper, and will often take the place of a high-price machine. Full particulars can be obtained by writing the Dominion Machinery Co., Toronto.

Dominion Disc Grinder

Perrin Hydraulic Veneer Presses

The accompanying illustrations show the type of hydraulic veneer press and retaining clamps manufactured by William R. Perrin, Limited, Toronto. The presses are usually made to order in size, stroke and pressure to suit the requirements of the purchaser. Thus anyone installing one of these presses is sure to secure a machine adapted to his work. They may be had in any size, including large presses for veneering doors. The construction is I beam, with steel stay rods. The stroke depends on the requirements of the purchaser, but averages about 18 inches. The ram and cylinder are cast steel, carefully machined. The platform is a one-piece iron casting. The pump may be had attached to the press or as a separate unit. The pressure may vary from a few pounds to several hundred tons. The retaining clamps are strong and



Hydraulic veneer press and retaining clamps manufactured by William R. Perrin, Limited, Toronto

C. M. C. hand block belt sander

designed for quick action. Using clamps the press may be kept working steadily, without let-up. Perrin veneer room equipment is found in many Canadian plants. Some of the most recent installations are the Globe-Wernicke Co., Limited, Stratford, Ont., Preston Furniture Co., Limited, Preston, Ont., and the Anthes Furniture Co., Limited, Kitchener, Ont. Further information may be secured by writing the William R. Perrin, Limited. Toronto.

C. M. C. Hand Block Belt Sander

The accompanying illustration shows the hand block belt sander which the Canadian Machinery Corporation of Galt, Ont., are offering to the trade. Like other C. M. C. products this sander is well designed and well finished. It can be adjusted to accommodate a very wide range of work. While the columns should be set about 20 feet apart for best results, they can be placed further apart if the work calls for a greater distance. The table, which is 32 in. wide and 77 in. long, has sufficient vertical adjustment to permit stock as thick as 12 in. to be worked on the table. The columns are made rigid to eliminate all vibration. The vertical adjustment of the table is made by means of rack and pinions operated by worm and hand wheel. A countershaft is not needed as the machine is driven by fast and loose pulleys on the drive shaft. If required, it may be had fitted for the installation of an individual motor drive. The sand belt pulleys are 14 in. diameter and 8 in. face, taking belt up to 8 in. in width. The drive pulley is covered with rubber so that a positive drive to the sand belt is ensured. Idler pulleys, one counterbalanced, are provided to maintain the belt at the proper tension and keep it out of the way of the operator. Adequate lubrication is provided for by numerous compression grease cup. Using grease eliminates the danger of the work being spattered with oil. It is an efficient up-to-date machine in every respect. Further particulars may be secured from the above mentioned firm.

Box Manufacturers Organize

The box manufacturers of British Columbia recently organized as a section of the British Columbia Division of the Canadian Manufacturers' Association, as it was the feeling among the individuals that some such forms of association was necessary to enable them to co-operate in handling of not only domestic business but also the large amount of export trade offering. Many substantial orders have already been taken on and apportioned between the manufacturers according to the capacity of plant or the condition of their order books.

The chairman of the new organization is Mr. R. B. Sharpe, of the Pacific Box Company, Vancouver. The other officers are W. B. Mitchell, Cameron Lumber Company, vice-chairman for Victoria, D. Lloyd-Jones, Kelowna Saw Mills Co., Ltd., vice-chairman for Okanagan, H. C. Airth, Brunette Saw Mills Co., New Westminster, chairman Export Committee; P. J. Murphy, B. C. Manufacturing Co., treasurer; Hugh Dalton, secretary. The association has offices with the Canadian Manufacturers' Association in the Board of Trade Building, Vancouver.

Where Difference Comes In

Manufacturers of fibre are somewhat worried over the carelessness of shippers in not properly tapeing and sealing the outer joints and seams. They are also attempting to discourage the re-use of such containers. They believe that the fibre container is just good enough to be used once, but no more. No one has discovered, however, that the wood box is any worse for re-use because of having once passed through the rough handling incident to modern transportation; for if it has been racked a few additional nails will repair it.—American Lumberman.

The automatic lathe is a production machine that increases the profits of its owner.

Upholstering and Trimming

Better Human Relations in Industry

By D. D. Fennell*

Industrial unrest has become increasingly general of late. Four men of somewhat unstable character, possessing however, a knowledge of practical psychology, suddenly develop the conclusion that the switchmen of Chicago should receive an increase in wages at once, regardless of laws or of wage boards or of the community, and succeed within three days, without any apparent leadership, in persuading thousands of switchmen to leave their jobs and strike without the authorization or the approval of union officials, and in direct opposition to the union officials. All switching in Chicago, Philadelphia, New York and various other centres ceases.

A few men of the same agitational tendencies soon reach the firemen and engineers with propaganda, and they leave their locomotives in great numbers. As a result, unmanned trains are strung along the tracks at the approaches to every city in the country. The principal source of meat supply, the U. S. Yards, becomes inoperative. Hundreds of thousands of workmen are deprived of employment, and industry suffers over the entire country. The strike is not yet settled and the country stands to lose hundreds of millions of dollars. In this phenomenon is seen a fundamental human passion in itself natural and benign become destructive through misdirection.

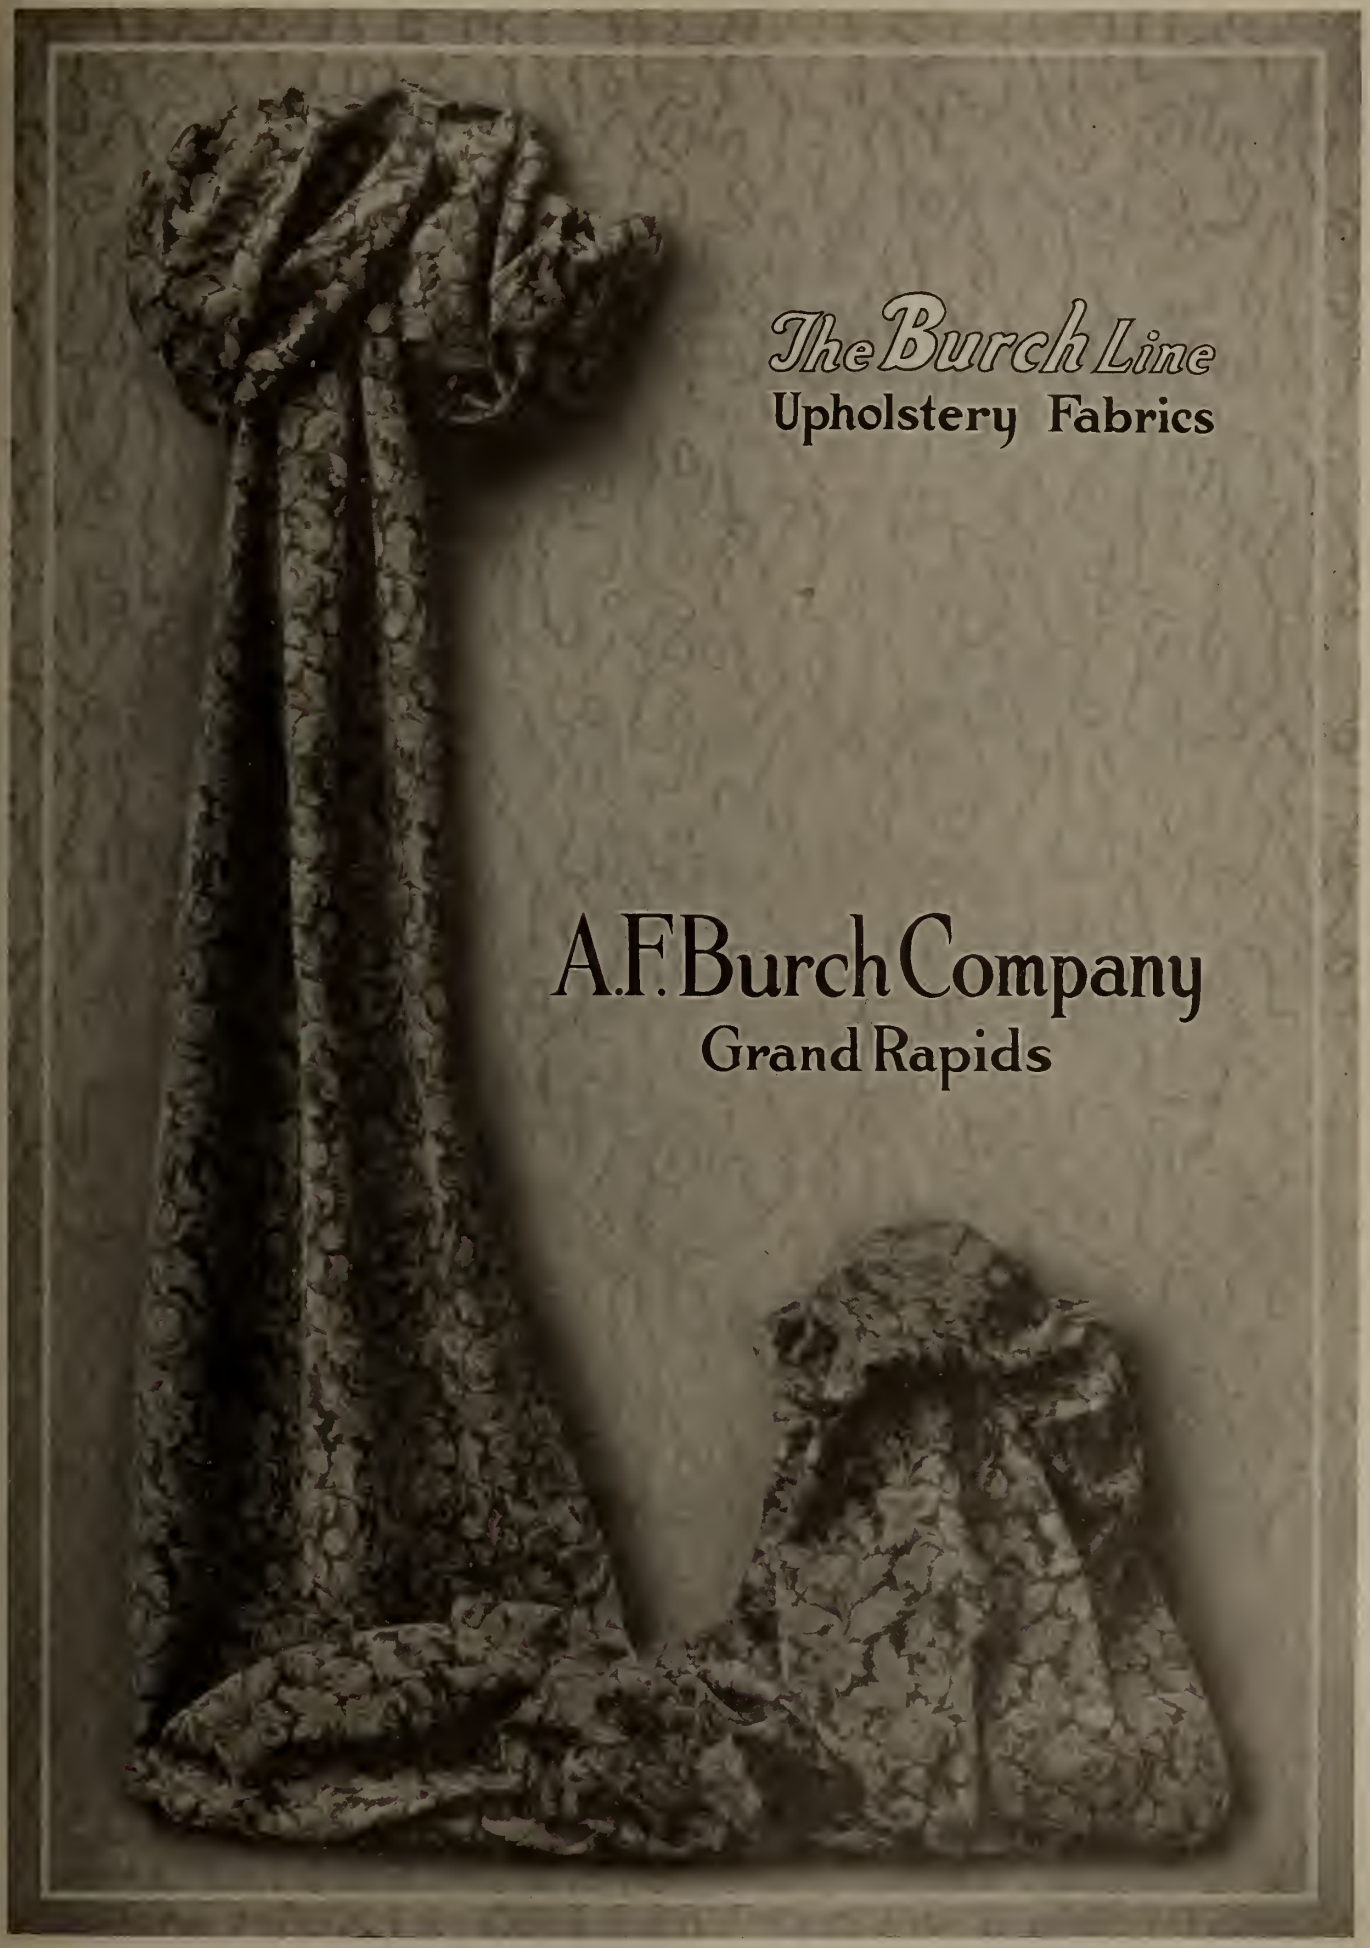
It has been the custom of statisticians and economists to compare manifestations of the character we are witnessing with similar disturbances following some direct or indirect causes in history. Comparisons are now inadequate. Following the Civil War we had our labor problems in America, but for seven years after that war the country had an unprecedented period of industrial and commercial activity. The problem was purely national, the elements usual, the workmen largely Ameircan. To-day there is woven into the structure of our industrial life strange rovings of multi-color with red plentifully represented. That is, elements foreign to American life and customs are being brought here by emissaries of misguided guilds of other lands.

The foundations of civilization are being tried and tested as never before. Powerful monarchies, for years thought to be invincible, have been reduced to chaotic ungoverned states in which every governmental plan known to political and social science is being tried out. We at a great distance from the scene of the late war are of course, suffering much from these causes, but the countries that were our allies are experiencing a measure of unrest to which ours is hardly comparable.

Is industrial unrest in itself to be deplored? Emphatically No! Without unrest, progress ceases automatically. When men no longer reach out and desire better things for themselves and their families the production chart will show a descending arc that will spell the disintegration of industry. There would have been no inventions, no discoveries in any of the various fields; there would be no progress in civilization if the human entity ever became satisfied with his accomplishments. Earlier in this address, I said, "In this phenomenon of unrest is seen a fundamental human passion in itself natural and benign become destructive through misdirection." Darwin's "Descent of Man" should have been called the "Ascent of Life." Starting with the first manifestations of life back in the geological ages is seen the struggle of the inert for expression. In embryonic organic life the lowest form of protoplasm struggled to attain vertebrae and brain. With the dawn of mind man reached out into the unknown striving for knowledge; exploring all existence at the behest of the spirit within him, which ever craves self-expression, and so all through the ages of the struggle for life and expression has made progress possible. The peculiar passion for self-expression is the father of our present day unrest.

There is another passion in men upon which the very perpetuity of the race depends, and that is the sex instinct, Nature's determination in the direction of reproduction. We have been wont to consider the phenomenon of love as a purely spiritual thing detached entirely from the physical. A woman becomes attracted to a man by the intuitive desire nature has put in her to have that man as the father of her child. Nature's demand for the preservation of the species develops sex desire and sex relation. With the advance of civilization the love element in sex relation has become spiritualized until this reproductive determination has become the holiest of human purposes. And yet, when sex desire is misused and misdirected it is the cause of much of the world's troubles. The same is true with regard to the urge in man that drives him in the direction of progress. I once saw a tree, the top of which someone had tied when a sapling to a small stump. That tree, large of trunk and otherwise normally healthful became a misanthrope, sending its limbs down into the ground instead of up toward the sky as was its normal bent. This illimitable desire in man for progress properly directed is the hope of the world; improperly directed, it becomes a destructive element in society with a power to greatly retard the progress of mankind. Give to men in the mass a grievance fancied or real and immediately the urge that is in them badly directed leads to fantastic manifestations. Some men will claim glibly and immediately that much of the cause of the present industrial unrest is the high cost of living. This is only measurably true. Before discussing the proposition we must inquire into the cause of the high cost of living. Fundamentally the wastage of war, the turning of millions of men from productive to destructive activity, the call for the expenditure of vast sums of money, increasing thereby the volume of money and decreasing its value, are among the chief causes of high prices to be sure. Various estimates of the shortage of food stuffs, clothing and

*Director Industrial Relations, National Association Upholstered Furniture Manufacturers.



The Burch Line
Upholstery Fabrics
A.F. Burch Company
Grand Rapids

other necessities of life have been made. A favorite figure seems to be 30 per cent. That is, we are 30 per cent. behind our normal needs. While we have multiplied our factory units since 1914 our rate of production per man has decreased hazardously. Now the wealth of a nation consists in what a nation possesses, in excess of its absolute normal needs. Only when we are producing more than we need and placing it in reserve, or exporting it, do we accumlate national wealth. If we are 30 per cent. behind our needs and production on the other hand is from 35 to 55 per cent. below normal, depending upon the particular craft, then we are becoming a poorer nation every day, because we are going into debt faster all the while. Naturally the law of supply and demand determines that the present cost of all commodities must needs be high, inasmuch as there is not a sufficient supply for all. Obviously spendthrifty on the part of workmen suddenly become affluent creates excessive demand.

The first remedy to be used in the reduction of the high cost of living and in the checking of industrial unrest is the simple cureall—work. To the men of France, the distinguished Mayor of the City of Lyons, in a recent book the "Creer," started his discussion of the needs of France with the clarion note "Produce or Perish." There is nothing fantastic in that slogan. He knows and France knows her only hope lies here.

One of the best editorials that has been written on this subject of late is by Hugh Wiley in the Saturday Evening Post of April 10th. It is entitled "Sweat or Die." He urges throughout this editorial the acceptance of the truism that something cannot come from nothing. Says he: "The one appropriate currency with which to pay for life is sweat. Man is capable of transforming the fuel of food into energy and work. We can buy the right to live with a proper daily expenditure of useful work. The individual who does not pay the price of life has no right to it. Society is made up of men, women and children. Men and women must work. When every man and every women works the high cost of living, political discord, strikes and all the phenomena of social unrest will be at an end. Work is the cure. It is the only cure."

Unfortunately appeals of this character generally fail to develop reactions in the workman. Leadership in industrial relations lies with management largely. Production under right conditions to-day is our country's salvation.

As a plain statement of principles I will read to you a platform which expresses the open shop ideals of this Association:—

Industrial unrest can be directed or corrected, the high cost of living reduced and a general spirit of interest in his work be developed in the employee when men are once more taught to recognize the glory of work and the satisfaction of doing it well.

The interests of employer and employee must needs be made identical, the process involving education and guidance.

But education is effective only when the minds and bodies of men are free to respond to it. Preliminary to the accomplishment of anything like right conditions in our plants it is necessary that every shop be made an open shop under what has now come to be called the "American Plan."

(Continued in July issue)

Personnel Canadian Fabrikoid Staff

Through the absorption of many new companies Canadian Explosives, Ltd., who control Canadian Fabrikoid, Ltd., and other concerns, have been required to make extensive readjustments of sales forces and make announcement of the following changes at head office and at other points:

Winthrop Brainerd, vice-president, and in charge of all sales; E. W. Monk, general director of sales; W. A. Cotton, director of sales, Canadian Fabrikoid, Ltd.; J. J. Riley, director of sales, Flint Varnish & Color Works of Canada, Ltd.; J. B. Moriarty, sales manager for all companies, Montreal district; J. W. Holmes, general sales manager, Toronto district; H. M. Wylde, general sales manager, Halifax district; R. T. Stewart, general sales manager, Sudbury district; A. C. Wilson, general sales manager, Toronto district; P. H. Auston, general sales manager, Vancouver district.

A. W. Purtle has been appointed district sales manager at Toronto for Canadian Fabrikoid, Ltd., with C. W. Campbell, district sales manager, Montreal; and W. J. Corbett, district sales manager, Winnipeg.

Using Business Cards to Advantage

Too many business cards are cast into a drawer or get buried under papers. The result is that when the name of a firm or its representative, specializing in a certain particular line, is desired, the little bit of pasteboard cannot be located. A London, Ont., retail lumber merchant has adopted the idea of putting all cards of forest products firms and their representatives in a neat wire frame, suspended from the wall, close to his desk. The references are then readily available and, in case he wants a certain line of stock on short notice, by glancing over the cards, he recalls quickly to mind what each man deals in, what stock he has in hand, and the occasion of his last visit. There is no looking around for addresses, initials or other matters that may entail delay. The plan of keeping the cards in a prominent place is one that is working out very satisfactorily.

Market for Butter Boxes

A South African agricultural society is in the market for 100,000 butter boxes of standard specification and would like to get in touch with Canadian manufacturers who can handle this business. Quotations are C.I.F., Durban, S.A., and for prompt shipment. Boxes to be made from whitewood, planed on one side, thoroughly seasoned and free from odor and to the following specifications: No. 1. Tops and bottoms— 16 in. x 11½ in. x ½ in. in two pieces, tongued, grooved and glued. Sides—16 in. x 11½ in. x ½ in. in two pieces, tongued, grooved and glued. Ends—10½ in. x 11½ in. x ⅝ in. in two pieces, tongued, grooved and glued. Or No. 3. Tops and bottoms—13¼ in. x 13 in. x ½ in. in two pieces, tongued, grooved and glued. Sides—13¼ in. x 12 in. x ½ in. in two pieces, tongued, grooved and glued. Ends—12 in. x 12 in. x ⅝ in. in two pieces, tongued, grooved and glued.

Cause and Prevention of Pinholes

Trouble Invited Unless Filling is Given Attention—Consistency of Filler Varied for Different Woods

By Dixy Wells

Much misunderstanding and some confusion prevails regarding the cause of pinholes in finished work. The matter must be thoroughly understood if prevention is to be brought about, in fact, like many other things if they are once understood their recurrence can be controlled. Take a powerful microscope and you will find that a pinhole is generally the center of a pore, that is, a pore that has not been filled in the fillling process.

In talking with an old finisher, who seemed to be having more than his share of trouble with pinholes, he contended that on certain work he had found it impossible to apply a finish that would not eventually show pinholes unless he used a great many coats of varnish. Especially where veneer was used, he found that the fillers in many cases failed to fill, and to seemingly prove his argument he filled some pieces while I was there and predicted that when they had received many coats of varnish the pinholes would still be present, but the panels were filled and varnished in the ordinary way and there were no pinholes.

Importance of Proper Filling

Now, what was the answer? The filler used had done its work satisfactorily. Done what it was bought to do, filled up the pores. No matter what kind of a filler one is using, if it does not fill with satisfaction, if it does not fill up the pores of the wood when applied correctly, it is not a proper wood filler. It is not performing the functions for which it was purchased.

When one examines a pinhole carefully under a microscope it appears like a tiny bottomless well, and differs from a slight depression. One seldom finds pinholes in shallow pores because the finishing material reaches to the bottom of a pore of this character, and each coat of material which falls, resting on the bottom, gradually fills it up until at last nothing but a slight depression is left. The finishing material never seems to get to the bottom of pinholes. The succeeding coats of varnish apparently fill it, but it is not really filled from the bottom up, but merely closed in at the top by the many coats increasing the thickness of the coatings on the wall. From this it will be seen that a pinhole is a deep pore, down the inner sides of which the finishing materials have run without really getting to the bottom, thus, a pinhole is really the center of a pore, which examination by a magnifying glass will show. So you will see the logical way of preventing pinholes is to start with the application of a filler and make sure that you apply it in such a way that it reaches the bottom and thoroughly fills the pores.

Spraying machines do not always give satisfaction, as some of you know who have tried to use them for the application of filler. One reason is that it merely makes a surface application, that is, there isn't enough force to work it into the pores, which should be done if fillers are to perform their functions properly. Of course they must be made right and applied right.

Some people believe that all that is necessary with a filler is to rub it well into the wood and then clean off the surplus, but we disagree with this. The only way one can be sure of reaching the bottom of the pores is to work the filler well into the wood while it is yet in the liquid state, and you should then proceed to brush it both across and with the grain. This works all the air out of the pores and forces the filler in. If this is not done the filler simply stays on top and covers over the entrance of the pores leaving the air hole beneath, and this air of course is not disposed of during the cleaning off process.

Consistency of Material Important

Some finishers also believe that the filler should be applied in a very thick state, so that there is considerable surplus left to clean off, and this surplus is later thrown away. Fillers of course should be used thick enough to fill up the pores no matter how much filler you use or may be left to clean off. You can't half fill the pores of wood with liquid and then complete the filling process by rubbing off the surplus. We believe you are wasting both time and material in doing this. It takes a lot of time to clean off filler, and you should be sure that the filling process has all been accomplished otherwise results will certainly be unsatisfactory, especially, on such porous wood as oak or in many cases on rotary cut mahogany and walnut veneers.

The thing to do in this case is to apply an even coat of filler to a piece of very porous veneer, and then after the filler is dry enough to clean off examine it carefully. If a good filler has been used and care in application exercised, it will be found that the filler has been forced into the pores very well. If you applied it thinly you will find the pores quite open and the filler in the pores sunk below the level of the wood surrounding it. Evaporation of the volatile oils which the filler contains partly causes this shrinkage, and partly through the absorption of the oils by the wood. These two processes of evaporation and absorption leave the pigment in the first oil in the pore to do the work for which proper filling is intended.

If a very heavy filler is used, that is one which contains a quantity of volatile oils and a large proportion of pigment you will find there is less shrinkage, due to decreased evaporation and also to a decreased absorption of the oil. If you bear this in mind you will easily discover the wisdom of regulating the consistency of the filler to meet the individual requirements of the porosity of the wood to be filled.

What Experiments Have Demonstrated

Some finishers have come forward with the argument that filler of uniform consistency could be satisfactorily used on all woods, accomplishing this by merely increasing the amount put on the more porous

woods, but very careful and practical experiments have shown recently that this is not always the case. One finisher even went so far in his experimenting as to use a thin filler twice when filling oak instead of applying a heavy filler once, but the experiment only proved that two applications almost doubled the cost of time and material, and the results were less satisfactory than when one adequate coat was used, and the time consumed also held up the moving of the stock through the shop for twenty-four hours at least.

Other experiments have shown that filler which is made suitable for oak, for instance, or for any one of the other porous woods will not properly function in the matter of best results on porous woods like birch by merely using the customary volatile oils for thinning.

The binder of the usual filler is linseed oil and japan, and these lose their binding qualities if reduced beyond a certain point when other thinners are added such as benzine or turpentine. For this reason a small quantity of oil and japan should be added to a filler before you start to thin it, especially for such woods as birch unless the filler has been properly made for use on the less porous woods.

The Vogue of White Finished Woodwork

Light Interiors and Light Furniture Growing in Popularity—Makes For Bright Cheerful Home—Birch Very Suitable Wood For White Work—Fits in With Almost Any Decorative Scheme

By W. H. Shaw

Someone has called this the period of white enamels. An appreciation of our great building period, due to an increasing knowledge of the beauties of the fine old colonial houses, has indeed largely influenced the builder of modern homes. The influence of colonial building, strong though it may be, is only in part responsible for the vogue of the white interior, so popular at the present time.

In part it may be the last stages of the reaction from the excessively dark finish given to woodwork some years ago—as part of the so-called mission shades for bungalow finish and furniture. In part it may be the effect of an effort to use less expensive woods for the interior woodwork while preserving the beauty of the home. Be that as it may the white or light painted interior is to be found in practically every type of house, and in every variety of condition.

Light Colors for Cheerfulness

Perhaps more than anything else the use of light paint and enamel for the interior woodwork and the greater freedom with which color is being used in the home, shows the need people are feeling for brightness and cheer in the home.

It is a well-known fact that the color and amount of light in the houses we inhabit produce in us physical effects, and effect to a considerable extent our health and, consequently, our happiness. Why this should be true is obvious when we consider the immense effect that light and color have on all forms of organic life. A cool, dark room is a delightful place in which to pass a few hours on a sultry day. but who would care to spend all their days in such a room.

So popular favor is again turning towards painted woodwork for the interior finish, as well as for furniture. Many charming effects are obtained by the use of color. White or old ivory interiors give a happy solution for many kinds of problems, and one may expect quite satisfactory results from its use. The white interior will harmonize with almost any form of wall decoration and style of furniture, and the readiness with which it may be cleaned and renewed adds to its desirability. It may be counted upon to give the bright and cheerful effect which we wish to incorporate in our homes.

Are Dark Finishes Losing Favor

The living room of the small house of but a few years ago was often finished in some comparatively dark style, very commonly in oak or in some stained-pine imitation of it. To-day, however, the popular leaning is towards quite the opposite. The vogue at present is, in fact, that the room be finished in white enamel or in ivory, or a very light tint. And, indeed, it seems to represent a most commendable notion. It means, for one thing, that instead of sometimes appearing very dark and, perhaps gloomy, especially in cloudy days, the room is always bright and. hence, endowed with an atmosphere of cheerfulness. Yet if the matter of its decorating, furnishing and so forth be properly handled, it will, at the same time, be cosy and in every way comfortable and inviting. Then, too, this style of finish invariably suggests simplicity, and this has also come to be regarded a desirable attribute.

The light-finished living room of to-day is probably largely the result of the recently re-awakened interest in Colonial style of home architecture, at least not only in woodwork but in general treatment, it very often affects the Colonial, although not always. Anyway this style, without entirely losing its identity, is meeting with rather broad interpretation at the hands of the modern builder, and usually with desirable results. It is therefore but natural that this tendency towards the rendering of varied modifications of the style be found extended to the living room. Hence rather wide latitude for the introduction of individuality in the room is allowed, which, naturally helps to create a preference over the strictly Colonial.

Mahogany to Relieve the White

Many charming old Colonial rooms were done entirely in white, with high wainscoting or panelled walls, all painted white, bringing out the subtle curves of the delicate mouldings. This treatment was used more often for the hall and dining room. and mahogany was often used to relieve the white, in the woodwork itself, or in the furniture or in both. This treatment has been adapted to modern conditions with particular success. A charming hall in a modern home can be arranged where birch treads, and birch nevell posts and handrail (mahogany finished) have been used in a white panelled hall, and stairway with white strings, risers and ballusters also finished in white.

When the walls and woodwork of the dining room are finished white, it is advisable that the furniture and usually the doors be of mahogany color or some

other rich colored wood, otherwise the effect of an all white room may otherwise be cold.

When it has been decided that the woodwork in the new home is to be painted or enameled, that fact should be taken into account when the kind of wood to be used is specified. Such wood should be selected as will give the most satisfactory results when painted. This is a vital point. Failure to take into account the individuality of the wood has many times brought trouble and disappointment, and aften unexpected expense during the progress of the work or in the results.

Selection of Wood Important

When the interior woodwork is to be enamelled, woods should be selected which are neutral in grain and color. Among the woods which are most suitable for finishing an enamel are birch, gumwood, basswood, whitewood, maple and the soft non-resinous pines. Especially for the better class of house many good architects, through long and intimate acquaintance with certain hardwoods, tend to specify such woods as the only base for all white treatment.

Many of the fine pieces of beautiful enameled and painted furniture are made of the most costly woods. The first cost of wood, in such cases. is so small a part of the total cost, with its exquisite workmanship, that there is not sufficient economic reason for using less expensive woods. The same thing may be true in an expensive house, but in much of our home building the small savings are of importance.

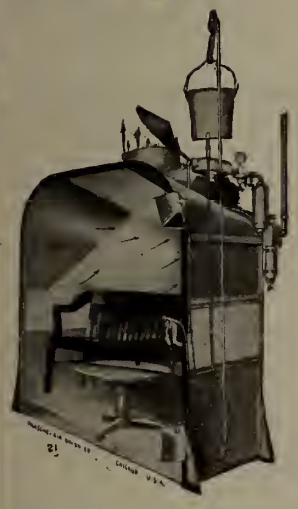
Aids in Lowering Construction

The woodwork in this class of work may be of pine or any of the other comparatively soft woods. This means that it need not be nearly so expensive in either material or workmanship in finishing as using either oak or mahogany and hence, even though it may cost a little more to finsh, the Colonial or light finished interior may also at the same time represent economy.

In the first reaction from the darker finishes people sometimes talked of the white and enameled finishes as "showing the dirt." It was soon realized, however, that if dirt were present it is much better to see it. It was also asked if it was a costly process and a lasting one. It is true there are many cheap, unsatisfactory paints and enamels in the market which are costly, at any price. If high-grade materials, put up by a reliable manufacturer, are properly applied, there is no element of frailty in the finish. The enamel surface is washable and is easily cared for and kept in fine condition. It need cost no more than any other good job of wood finishing, and indeed may cost less. It costs so much for the labor of applying any kind of finish, especially in a big job of work that the difference in the price per gallon between a cheap and a fine enamel is comparatively insignificant as compared with the possibility of the work having to be renewed if unsatisfactory. "Cheap finishes by the gallon are expensive by the job."

The white finished living room, dining room and hall are, of course, not restricted as a possibility to the builder of a new home only. The old style, dark finished room of the house built some years ago may be easily transformed into the new style, by a thorough overhauling in respect to wood finish, decorations, and so forth. In fact this is done quite extensively and if done rightly the result is no less satisfying than if it had been so handled in the beginning.

PAASCHE



Most efficient and economical air finishing system known. One of our many popular (completely equipped) air finishing outfits as used by furniture plants everywhere. Made in various sizes to meet all requirements. Successfully applies liquid materials—all kinds and descriptions.

Increasing Efficiency of the Finishing Room

Many Items that Go to Make Up Ideal Finishing Department—Ventilation, Including Floor Exhaust, Very Important—Northern Exposure Gives Best Results Generally

Greatest efficiency dictates that the finishing room be located in the top story of the building. The advantages of this location outweigh the disadvantages. Top story location keeps the finishing department away from the dust of the woodworking departments. While the accumulation of gases of the various departments will rise and ultimately reach the finishing room, provision can be made for carrying them away by means of ventilators in the roof. These ventilators will also take away the fumes of the finishing room proper.

A floor exhaust should also be provided because some materials used in the finishing room produce gaseous compounds that are heavier than air. Such materials are naptha, benzole and similar hydrocarbon compounds. Where naptha is used in large quantities, unless a proper floor exhaust is provided, the fumes may follow the floor, down the elevator shaft to the boiler room in the basement with dangerous results. Proper ventilation will reduce insurance rates—improper ventilation will increase them.

Drying Kiln a Necessity

The modern finishing room should by all means have a modern varnish drying kiln in conjunction with it. Although varnish drying rooms are a comparatively recent development, their worth has been conclusively demonstrated. Where days were formerly required to dry varnish, this can now be accomplished in almost so many hours.

The finishing room should be so planned that the furniture will follow from one process to another with no lost motion. In a factory with one elevator, the finishing room layout should, if possible, provide for the stock being unloaded into the staining department, and moved from there in order to the shellacing, sanding, varnishing and rubbing and polishing rooms. The varnishing and rubbing rooms should adjoin each other if possible, and be near to the elevator, if this can be arranged. Where the goods are dipped in stain or filler it is best to have the places where these operations are done, partitioned off, and a good ventilating system installed to carry away the gases, in order to keep the nauseating gases from the other workers.

The lift truck which carries furniture to be finished on platforms from one process to another is recommended for any factory that is interested in saving time and labor.

Heating Very Important

The heating of the finishing room has an important bearing on results. The temperature should be kept as uniform as possible day and night. Especially is heat and proper ventilation important in the varnishing room. Steam heating is best adapted for the varnishing room. Air systems are all right for other departments, but are apt to convey dust to the finishing room. This dust will eventually settle on the flat surfaces of the work and mar the finish.

Radiators will give more satisfactory results than steam pipes. They should be placed at regular distances along the wall. Radiators used in connection with a thermostat allow for an automatic control of heat and the maintenance of an even temperature, which is impossible when steam pipes are used.

The best location for steam pipes is along the walls, near the floor. This insures more even temperature. Where it is absolutely necessary, the pipes can, of course, be placed overhead. In this case they should be placed along the walls above the windows and not directly over the men's heads.

The up-to-date finishing room should have some system for regulating the circulation of air and the conditioning of the air so that it will carry the same percentage of moisture all the time.

Good Light Aids Production

Too much attention cannot be paid to the lighting of the finishing room. Good light enables the workmen to maintain uniformity in stain shades and makes for greater skill and more satisfactory results in spreading varnish and other finishing coats. The best light is that coming from the north because it will remain practically uniform all day. When the light comes from any of the other three sides it will vary with the passing of the sun. Direct sunlight, too, should be avoided for another reason. Sunlight shining directly on finished or unfinished woodwork has a tendency to bleach out and deaden the colors. To keep finished work fresh, or even prepared woodwork, before the finish is applied, it should be stored in a dark place and especially protected from sunlight.

Daylight is, of course, preferable to artificial light, although the electric manufacturers are making rapid strides towards producing something "almost as good" as daylight. Finishing the walls and ceiling in white helps to make the most of the natural daylights, cuts down the artificial lighting bill and gets the greatest efficiency from artificial light when it is used. Do not, however, whitewash the finishing room. Whitewash is not like paint, the liquid of which acts as a binder.

Whitewash Falls Off On Work

Whitewash, on the other hand, contains water as the liquid which allows it to be spread out. Water, as everyone knows, has no binding qualities, while the other materials in whitewash—lime and other ingredients, are too heavy to penetrate far enough to get a firm hold. As a result, with changing temperatures and the contraction and expansion which this causes, the whitewash being brittle, cracks and falls off. Any finisher knows what this means to freshly varnished stock and even to stock when it is dry. The ideal finish, not only for the finishing room, but for all over the furniture factory is a good make of mill white made by some reliable manufacturer. Its cost is not nearly so great as the ultimate cost of whitewash.

A constant supply of hot water is essential to the finishing room. The best method of heating is a vat with steam coils in bottom. Where chemical compounds are used the only safe method to employ is the coil with the return pipe. Where chemical compounds are not used or the water is to be used for cleaning, heating, etc., the steam may be turned directly into the water.—"Finishing Facts."

BIG 4

Write for sample panel showing four great Marietta Specialties, as follows:

MACO

The new principle non-fading Mahogany stain.
Has the non-fading quality of a water stain.
The non-grain-raising quality of an oil stain.
Can be filled directly over the stain like a spirit stain.

KOPALAC

"The last word in spirit Varnishes."
Has heavier gum body than shellac and holds up varnish coatings better. Can be either brushed or sprayed. Will not turn white nor fog when sprayed.
Guaranteed to contain no rosin.

SPARTAN CRACK FILLER

A non-shrinking cement for filling cracks, holes, wind checks and other defects in wood. Saves good lumber that might otherwise be wasted. Made in shades to match the stain. Dries in half an hour.

MARIETTA VARNISH

To cap the climax, the panel we send you will be finished with Marietta Varnish. A high grade article strictly up to the Marietta standard of working and wearing qualities.

Look for this trade mark on the back of every belt, sheet or disc.

A Straight Line is—etc. Q. E. D.

"You'll wish you had a Ford," said the gatekeeper. And I did.

Long before I finished my trip through the Showers Brothers Company's great furniture plant at Bloomington, Indiana, I was fagged and footsore. But interesting? The Showers' factory has it on any circus for interest.

The plant stretches straight away from North to South. A straight line is the shortest distance between two points. And that's how this company makes furniture—in a straight line—from North to South. Logs at the North end, chiffonniers or something at the South. No waste motion—straight line production.

"We'll take the same route a log does," said the Human Arithmetic who was acting as guide, "and we won't back-track a single step."

Then he threw in his clutch. "Factory grounds, 69 acres; yearly consumption of lumber, 24,000,000 feet; our own forest; our own mirror plant; our own veneer plant; 25,000,000 feet of veneers a year; a finished piece of furniture every 40 seconds!" His record of statistics turned all through the trip.

We stopped in the sanding room. Here a crew of bix Six-Drum Sanders whirred busily as their fast cutting abrasive belts finished and smoothed the constant stream of wooden parts.

"Some speed here," I ventured. "Got to be to keep up," replied one of the Drum Sander operators —Ezra Hamilton, his name turned out to be.

"How do we do it? Straight line stuff right through. If it's a question of tools the boss gets after the fellow using 'em. 'What's the best abrasive belt made?' he asked me about two years ago. 'Well, I dunno', I began, 'but I guess-' 'Don't guess. Find out. Try 'em all', he came back. Well, I made tests and-" He pointed to the fast cutting Manning Speed-grits belts which help Showers' sanding department to keep up to one finished piece of furniture every 40 seconds.

"There's the answer."

The above photograph shows the Nichols Equipment installed in the works of the Votey Organ Company, Garwood, N.J. These dryers may be used to turn out automobile bodies, furniture, pianos, talking machines, etc., in as many days as it formerly took weeks, and the finish is better, for it is dried scientifically, from the inside out.

If not already Nichols equipped, you owe it to yourself at least to investigate, because:—

1—It will easily triple the output of your finishing rooms.

2—It will decrease congestion in your factory.

3—It will decrease the investment in goods necessarily in process.

4—It will enable you to make more prompt deliveries.

We will analyze your particular conditions and then make you a proposition on an equipment that we know, from our extended experience, will save you time and money, as well as improve your product.

We guarantee fully the efficiency of the equipment as well as its mechanical construction. Every installation has been successful. There are hundreds of concerns to whom we can refer you.

A. S. NICHOLS COMPANY, 33 W. 42nd St. NEW YORK CITY

Manufacturers of Dryers for Lumber, Veneers, Glued Stock, Varnish, Paint and Enamels, for both high and low temperature work. Also sole agents for "Zenitherm" insulating material for the making of rooms for both high and low temperature drying.

Aeron Finishing System (Surpasses Brushing) **Certainty of Utmost Finishing Room Results**

The years of result-getting, satisfactory service that the Aeron spray-finishing system has been rendering the wood and metal-working industries, gives to each new installation of this equipment an assurance of the utmost in quality, speed and economy.

No matter what type, size or grade of product you manufacture, nor with what kind of finishing material you coat it—the Aeron System undoubtedly is now being used on work of the same or a similar character, and will be most certain to make it possible for you to do the highest grade of work at a big reduction in costs.

Operation Facts One Aeron operator easily does the work of 2 to 5 or more hand brushers--this is governed by nature of work.

A cleaner and more uniform coating of every material is applied—there are no brush marks, thin spots or fatty edges.

Work is made absolutely healthful and safe—all fumes are completely removed.

Equipment is kept in the best working condition at practically no cost.

The Aeron System is sold on a strictly guaranteed basis, and every installation followed up by a competent service organization.

Write and let us send on more definite particulars.

The DeVilbiss Mfg. Co. 3718 Detroit Ave. ***Toledo, Ohio, U. S. A.***

Veneers and Panels

What Are We Facing?

By S. B. Anderson*

Following the signing of the armistice, and continuing for some months, there was great uncertainty in business. The users of our goods conceived the idea that the country was entering on a season of low prices, and that the manufacturers of unfinished wood products had been getting too much for his product, and that a general withholding of buying orders would force prices down to a level consistant with his idea of our costs, and to what he thought should satisfy us. To our mind—prices were low, too low to pay us a fair profit or to stimulate us to very great productive efforts. In fact, production lagged; at the same time materials in the hands of the consumer was limited; demand for his goods active and his prices good. In due course of time he was compelled to go on the market to buy. He found small stocks in the hands of producers and no disposition on the part of the holders to sell at unprofitable prices. He found his competitor also on the market. He must have material and he was up against the old law of supply and demand, with supply small and demand large and growing. His own output was in eager demand and at remunerative prices. He found not only depleted stocks, but discouraging conditions for larger production—labor scarce, hard to get and not always efficient, high cost of operation, feed and general mill and logging supplies very dear; and following this a season of unprecedented rainfall through the logging sections of the south; from this on soft alluvial soil, but one thing could result, impossible logging conditions. He then did the only thing possible to do, stimulated production by recognizing the necessity for higher prices, and paying them. Many mills were utterly unable to secure logs. Others were more fortunately situated, and by extraordinary efforts, large expenditure for operations and buying of new devises for logging, were able soon to get out some a part, and others a full supply. How great this fight was no one knows who was not in the game. Logs that never had commanded above $12.00 to $20.00 readily sold for $50.00, $80.00 and even $100.00 and very scarce at even these prices. Now the mills that have been able to operate have made some money, and, in fact, this should be so. Hard, discouraging expensive labor, experimental investments and the energy put out should be rewarded. Unfortunately the opinion appears to have been formed, sometimes in high places, that the excessive prices now charged for our product simply means profiteering, but if we figure that the present actual costs of veneer, in many cases, is three and a half times the selling price of the same goods in what we are pleased to call normal times, it must be conceded that some, at least, of the advanced price is legitimate, and still the law of demand and supply rules. Possibly, in some cases, prices have run away with the market, but I believe, taking the circumstances fully into account, the millman has not been unreasonable. He, certainly, is entitled to a reward for hard work under very adverse conditions.

But I am not so much interested in the past, as I am in what is to come. I think you are all with me there. What are we facing? Is the present era of high prices and strong demand to continue, or are we coming into a time of ordinary demand with corresponding lowering of prices, or is the bottom about to fall out of everything and we all go down in a heap together? I am an optimist. I cannot see the likelihood of business disaster, in the near future. As long as the demand for goods exceeds the supply there should be no chance for a collapse in prices. Everybody, to a greater extent than ever before, has money and is earning more, and, as I said last year, money, in the hands of the people in general, farmers, mechanics, laborers and business men, speaks for good business. Money in the hands of the average American is for one purpose—for that purpose alone—to spend, and its spending means good business.

I can see that the sky is not entirely cloudless, there are some disquieting indications, some pressing problems—finance, labor, food. We were promised, with the establishing of the Reserve Bank system, a stable, sure system that would carry us through any and all storms. We were to be provided with an "elastic" currency, which would expand enough for any big business period and that would contract automatically and accomodate itself to periods of dullness. The system was to adjust itself to business conditions, and business was not, as heretofore, to be forced to adjust itself to a system—but something has gone wrong—the machinery is not working smoothly, the carburetor appears to need adjusting. The Reserve Bank claims to be working in the interest of lower cost of living. I see but two ways to lower prices—either to increase production, thus bringing supply gradually up to demand; or lessening demand by reducing the buying powers of the consumer, increasing interest rate, reducing credits. Taking away the tools of industry cannot help production. What it may do the other way remains to be seen. It is estimated that we have one third of the money in the world. Our mines are the richest and most extensive. The wealth of our forests is unequalled. We have the richest farming land in the world and the most of it—with many thousand of acres waiting the plow, an active, energetic and ambitious people—and we hesitate—our boasted system (or its managers) fail us in this moment of our greatest opportunity. The gap between our workers and our material can be bridged only with credit, and credit is denied. Men with courage and vision are needed in this crisis.

Then the labor problem to be settled. In my judgment, this does not mean the adjustment o f the price paid for a day's work, but means a day's work furnished when it is paid for regardless of price. It means some arrangement by which every citizen, laborer,

*President, Anderson-Tully Co., Memphis, Tenn.

mechanic, merchant, or what not, is to co-operate for the general good and not for the advance of any specific group. It means the establishment of a system through which every man, who is willing to co-operate and do his part, whether a large part or small, shall receive due reward, not a bare living, but a fair share of the results of his labor. It means that the time must come, and that soon, when the general public will be the first to be considered, and the interests of the employer and employee will not be considered paramount if running contrary to the general good. It means that the time is near when no combination of men, wage earners, or wage payers, will be allowed to tie up the business of the country as did the "unauthorized" switchmen's strike and the draymen with their sympathetic strike in New York. By the first, the commerce of the entire country was tied hand and foot, entailing a loss to the public of many millions of dollars; and by the latter the distribution of merchandise in New York was practically stopped for many days with an estimated loss of $2,000,000 per day. The employer and employee constitute but a small part of the public, and, under our government the majority must be considered. When our legislature realizes that the whole is greater than a part, and learn to fear the vote of the general public, as they now fear the power of a small organized part of it, we can hope for proper laws and their enforcement.

The third problem is closely allied with the labor problem. I will not indulge at any length in statistics, but there are some facts worth considering. The American wheat crop of 1919 was 248,000,000 bushels less than the crop of 1918 while there were 12,000,000 acres less winter wheat sowed in the fall of 1919, than sowed the previous fall. The 1919 crop was not up to the average of the preceeding five years. The agricultural papers are complaining of the impossibility of keeping up normal production on account of inability to secure farm labor. The prosperity of the manufacturer has enabled him to offer better wages than the farmer can pay, even at the present high prices of farm produce. In fact, the farmer is not today receiving a price for his product that will cover cost, if he figures his time at the wages of a common laborer in the city, and has a hired man at the same price. It is imperative that conditions be remedied. The growing population of the cities will require more and still more food, and the farms are the only source of supply. Possibly the introduction of improved methods, both operative and business, may result in an increase of production, and increase of profit to the farmer without any advance in prices to the consumer; cheaper distribution, so that the spread of price between that received by the farmer and that paid by the consumer may be lessened; larger farms with full equipment of machinery, run by business men, like the large wheat fields of the northwest; co-operative operation between small farms so that each may have the benefits from modern machinery; community tractors, by which cheap and good plowing can be assured; community reaper and thresher and haying machinery, all this will help. One man, in the future, must do the work of three men in the past. How far this remedy may correct the evil is hard to estimate. This, however, is for the future and not immediately available—but the evil is near at hand and growing. Every notice we seen of new mills built, old factories enlarged, new enterprises installed, is a notice that another draft is to be made against the farmers' working forces. Every additional machine installed makes the competition for labor more keen. Exodus of our foreign population exceeding immigration, retiring from active work by the newly prosperous, all tends to render the case more serious. Present price of food is high, but with the scarcity immediately impending how high it will soon be no one can prohpesy. With uncertain business following reduced credits, and resulting lowered incomes, the picture is not pleasant. A hungry populace is a dangerous populace. I am optimistic, but I see real danger ahead unless more farm labor can be procured from somewhere. Where can it be found? Europe appears to have no surplus laborers for us, but we must have common labor both for the farms and for the industries, and the native, white American will not supply it. He can do better. Shall we go hungry, suffer the terrors of bread riots and anarchy, or shall we avail ourselves of the only surplus labor in the world?

We are weak in transportation facilities. For the past ten years while the country has been growing and expanding, our lines of transportation have not only not grown to keep pace with the country's actual growth, but on the contrary have deteriorated. This is the natural result of the short-sighted policy adopted towards the railroads by the business public. He who dances must pay the fiddler. We had some years of fun heckling the railroads—now our merchandise, our manufactured goods, our grain and hay are tied up waiting for cars which are not yet built, or if they are, they are stranded in some terminal of 1900 capacity trying to pass through itself the traffic of 1920. We had our dance and we are paying the fiddler. Our hope of relief in this case rests on the new enlightened sentiment toward the railroads and the rapid development of our great inland water transportation possibilities.

Now to get back to our own future as a special industry. Whateven may happen to the general business of the country, with its resultant influence, we will never see the low prices that prevailed a few years ago. A strong advance in stumpage has taken place—but while much higher than a couple of years ago, it is a good purchase at present prices. It will continue to advance. This, with the advanced price of labor cost—which will stay—assures us that the era of low prices is permanently past, and my observation is that there is more money to be made in handling a high cost product than a cheap one. With the growing scarcity of good timber will come a hesitancy to cut any great amount without a legitimate return for investment and labor. There is every reason to expect an active demand for our product for some years ahead. The furniture supply of the country is far behind requirements and the manufacturers are crowded with orders, and as long as money is circulating freely this will continue. In short, I believe, while there is any business doing our industry will continue along profitable lines. I congratulate you on the results of the past six months and I look confidently forward to continuing prosperous operations.

A double belt may not transmit twice as much power as a single ply one, but it may give sufficient extra power to justify its installation.

Blow the shavings and sawdust in the firebox and save labor and at the same time increase the efficiency of the furnace.

The solid milled cutter should be ground only on the face of the cutting edge. If the top is ground the profile is altered.

CONTINUOUS SERVICE FOR TWO GENERATIONS

One of our principal competitors recently paid us the compliment of the voluntary statement that our position in the hardwood and veneer trade was the result of never varying from the traditions on which our organization was founded.

Northern Grown Oak

Fifty-two years of making and finishing the right kind of product has resulted in service of that character becoming not only a trade asset and the basis of a National reputation, but a veritable business habit. Our endeavor has for so long been to never deviate from the standards of 100 per cent. excellence as laid down by those who founded this business, that it is practically a matter of impossibility for us to vary the quality of our goods without a complete reorganization over to a high-speed, quantity basis.

American Beauty Walnut

It is recognized by the discriminating trade that our service incorporates not only goods of the highest possible excellence, but thorough understanding of the customer's requirements in order that his share of our always choice selection of goods may be precisely what he prefers.

Our knowledge of customers' needs and our ability to exactly meet those needs, recommend our service to you as a careful and experienced buyer.

Checks—Their Cause and Prevention

Moisture in Veneers Sole Cause of Checking—Have Veneers Dry Then Work So That Little, If Any, Moisture Be Absorbed—Humidifying Cabinet Room Hot-Box

By John Wilmers

Many troubles are encountered by the furniture manufacturer in the daily round of work and not the least of these is the checking of fancy veneers such as burls, crotches, butts and other similar stock. Some manufacturers are comparatively free from this trouble for long periods, while with others it occurs spasmodically.

The wheels of industry run smoothly for awhile, then suddenly there comes the complaint from the finishing or shipping department, or possibly from some buyer, that the veneers on certain pieces have checked. Then the fun commences. Nobody will accept the blame. Each department claims to have done their work the same as they have always done and so cannot understand why the work should have gone wrong. The veneer man maintains that that special grade of veneer seldom gives satisfaction, the finishers will probably say that the grade of glue is at fault, while the cabinet makers will more than likely try to blame the humidity controlled varnish dryer and so it goes.

Knowledge is Needed

Refusing to face the facts and trying to lay the blame elsewhere is but shirking responsibility, possibly through ignorance of the real cause of the trouble. If the physical properties of wood were studied and the adhesive strength of glues known, there should be no cause for checking if proper veneering methods were followed.

One reason why some plants are more successful than others is that due, largely, to the fault that a constant study is made of veneering methods and veneering conditions. When the factors that enter in are all known and provided for and a set of standards followed it stands to reason that uniform success should follow. Spasmodic success, where good results are achieved for a day or two, then troubles crop out unaccountably and abate, is due simply to luck. There may be times when one batch of glue is better than another or when the humidity of the veneer room happens to be ideal or the good results may be due to other things. One careless step in the process of veneering is responsible for a percentage of loss in the finished or semi-finished product, the same as one rotten apple often spoils a number of surrounding ones; likewise the longer the carelessness is allowed to persist the further its degrading influence reaches.

Shrinkage Sole Reason for Checks

The reason veneers check, as stated in a previous article, is due to shrinkage. The veneer shrinks when the moisture content is reduced, or in other words when the piece dries out. If it is glued solid and held from shrinking it does the next best thing—the fibres separate or check. It follows then that as long as we recognize that veneer is wood and that wood shrinks as it loses its moisture, we must observe the following principles: In order to prevent veneer checking its moisture content must not be above 5 per cent. or 6 per cent. when it is laid or when the pressure is applied. This is easy to say but harder to accomplish yet the success achieved in laying fine veneers depends solely upon this point under all circumstances.

There are different methods of preparing veneers for gluing such as glue sizing, doping with special mixtures and binding with glue size and cheese cloth. The idea in coating veneers is to keep out the moisture from the glue or at least to retard its absorption by the veneer. These practices may be beneficial to a very limited extent but the only coating that will keep all moisture out is aluminium leaf. It cannot be used in veneering.

Handling Glue to Advantage

If we cannot prevent the wood absorbing some moisture perhaps we can use the glue in such a manner that it will not give up much moisture, if any at all. Using animal glue this can be accomplished by either applying pressure as soon as the glue is applied or by letting the glue get tacky before the veneer is laid. When the warm cane is applied to the veneer it will warm the glue sufficiently to melt it slightly and cause a slight penetration into the veneer. The pressure should be applied as soon as possible as it will tend to prevent the veneer swelling.

Vegetable and casein glues do not penetrate as rapidly as animal glue, for they are not so viscid. Casein glue does not seem to give up its moisture as rapidly as vegetable glue but owing to certain mineral substances it contains, when thoroughly hard it is more severe on knives and saws.

Varnish Dryer Not to Blame

Much undeserved blame is placed at the door of varnish dryers. If they are humidity controlled, as they should be, there is little danger that they will harm the veneers. Humidity controlled varnish dryers are usually operated at a temperature of 120 deg. and a relative humidity of 30 per cent. or 35 per cent. Under these conditions wood will come to a moisture content of 5 per cent. or 6 per cent. If the veneers were glued up at 6 per cent. moisture content or less, it does not seem that the veneer could shrink or check in the varnish dryer.

If the moisture content of the material is higher than 6 per cent., and tests show that it often is, it is only natural that there should be a certain amount of shrinkage with its consequent checking. The varnish kilns cannot be blamed for this trouble, all they are doing is giving the management an opportunity of confining the troubles within the factory walls.

Humidifying the Hot-box

There are times when it is found necessary to warm up a veneered top or end when assembling a case. This heating is naturally done in a hot-box in the cabinet room. These boxes are hot and usually very dry, for no provision is made for maintaining humidity and in consequence some veneers which have been laid at 6 per cent. or even less will check. This checking is scarcely noticeable and when the stock has cooled will disappear gradually. It would have been better if this material had not checked, even so slightly. The simple expedient of installing a steam jet, or two, in the hot box or even using a pan filled

with water, provided the surface is large enough to induce a fair amount of evaporation, will guard against any checking in the box. A humidified hot box would not only benefit any veneered work placed in it but might eliminate some other troubles common to the cabinet room.

This discussion refers more particularly to the so-called open veneers; veneers through the pores of which light can be seen when held up to a window. It is because of this cross grained wood that it checks so readily. The straight grained veneer, unless very damp, seldom gives any trouble, for the fibres and cells are slightly elastic and give slightly when the veneer shrinks.

Billing System as Aid to Glue Room

Systematic Method of Keeping Tab on Stock Essential—Aids Production and Avoids Confusion—Efficient Method That Simplifies Work

By W. H. Rohr

In furniture factories where veneered goods are manufactured it is very important to have a systematic method of billing and routing face veneer, crossbanding and the rotary-cut core for ply panels. Without some such system neither quality nor quantity production can go forward with any degree of effectiveness or economy. It is by no means possible, even desirable, for every plant to use the same sort of billing and routing plan in getting out veneer, but the object in view in every system should be simplicity, thoroughness and accuracy.

Every veneer-billing system should at least possess these three characteristics, but as a matter of fact there is too often a lack of method and efficiency in such systems, if there are any systems in use at all. While the system herewith described is perhaps not ideal in every respect, it is nevertheless giving satisfactory results at the big plant of the American Furniture Co., manufacturer of fine bedroom and dining-room suites, Batesville, Ind. The plan has impressed me as being very effective and convenient for not only the foremen, but the various veneer workers as well.

The veneering end of the factory includes a large

veneer storage and dimension room in a semi-basement, where veneers are selected, cut, matched and taped, and a veneer glue room on the second floor, where ply panels, drawer bottoms, backs, tops and various flat and irregular- faced work are put up. The latter department contains a complete line of vegetable glue equipment, including mixers, spreaders, hydraulic press, flat and irregular cauls, retaining clamps and a dry room.

For every piece of veneered furniture in the line manufactured, the veneer foreman has on a file a written bill of veneer similar in many respects to a master cutting bill of solid material. When one or more jobs are started, or about to be started, the veneer foreman receives typewritten orders from the office. Suppose, for example, one item reads: "70 No. 473 Dresser Base; 50 Mhg., 20 Wal., No. 1538." This requires two cutting bills, one for the mahogany and one for walnut. The veneer foreman copies the order in his order book in duplicate, then tears out one copy, pins it to the original itemized bill of veneer for that particular dresser

Fig. 2—Gummed slip attached to each lot of veneers

base, and sends it to a stenographer in the office, who types two working bills for each kind of wood—see Fig. 1. The stenographer also types a set of gummed paper slips—see Fig. 2—which serve the same purpose in the veneer department as ordinary shop tickets serve in the solid-wood manufacturing end of the plant.

One copy of each veneer working bill, along with a set of gummed slips (one for each item on the bill), is sent to the veneer dimension room, while the other copy, with the original bill of veneer and the veneer foreman's written order, is returned to the veneer foreman.

As the various items of veneer are gotten out—that is, selected, matched, cut and taped—in the dimension room, the bill is checked as shown and a gummed slip like Fig. 2 is pasted on the top piece of each pile that makes up an item on the bill. This has proved to be a more effective method of marking sets of veneer, than loose tags or chalk marks. When all the items on a bill are out, the veneer is loaded onto trucks and sent to the veneer-glueing department. As the veneer is being loaded the items are again checked with an O. K. sign, as shown in Fig. 1.

In the veneer-gluing department the men work with the other copy of the working bill, which is, of course, clean and new to start with. The various items on the bill are checked off as the material leaves the press and again when it enters the drying room.—Veneers, Indianapolis.

Judging from the demand and prices of wooden toys, they should make a profitable sideline for anyone who has a considerable amount of wood waste.

The Lumber Market

Domestic Wood

The local hardwood lumber situation appears to be in a very healthy condition. Stocks, while green, appear to be ample, with a fair demand and prices holding firm. The weakest item on the list is probably maple, for which the demand is light. This is due largely to the uncertainty which exists with regard to the removal of the 10 per cent. import tax which the American custom authorities have been levying on maple when imported for cabinet making uses. There is a report to the effect that this duty will be removed in the near future. Until this is done or some definite announcement made, many American buyers are holding back and not placing orders for this particular item. When it is considered that probably 75 per cent. of all hardwoods cut in Canada find their way to the American market it will be realized just what effect the easing of the American demand has. Elm, ash and birch are particularly strong. Birch is probably in greater demand than any other wood. Prices on this line are very firm with a slight tendency to advance. This applies in a lesser degree to other hardwoods and is in marked contract to the situation surrounding American hardwoods. There the demand is light, with prices easing up on certain lines. The automobile industry is the biggest factor in the local hardwood situation and is one that must be recognized and reckoned with at all times. Auto manufacturers are turning more and more to such woods as birch, beech and maple, with the result that prices are climbing on these lines. The auto industry can afford to pay this increased values and are forcing other hardwood users to pay higher prices.

The softwood market is somewhat easier with slightly lower prices and a weaker demand. This is the direct result of the decreased demand from the American market. The Canadian demand continues good but cannot take care of all the material offering. Building conditions in most of the larger centres are good; while some of the smaller communities do not seem to have struck their stride yet. The B. C. market has been demoralized slightly by the easing of the American orders but a firmer tone is anticipated. Many coast mills are reducing operating time to one shift a day. This will tend to prevent an over production and a glutting of the market.

The box manufacturers are enjoying a good business and in consequence considerable box stock is moving. Prices on this item have not shown any marked changes.

Imported Woods

It is a very difficult, if not an impossible, task to attempt to forecast the American hardwood lumber market for any length of time. The situation is a very complex one, with many influencing factors and many side eddies. Those who are most vitally effected and who should be doing the most worrying, namely the lumber manufacturers and dealers, are sitting tight, seemingly calm and contented. There appears to be a slight falling off in the demand for many, if not all, lines of hardwoods and while in certain instances slight price concessions have been made, the general tone of the market is very firm. Even with the decreased demand, production and available stocks are not sufficient to fill the orders offering. This coupled with the probability of an increase in freight rates and the freight embargoes which are in force in several large centres, should apparently tend to maintain a strong market. It is estimated that at least one million houses are needed in the U. S. Many of these will be built in spite of high construction costs. This will help maintain the demand for stock. The American railways are in bad shape and part of the serious freight situation is due to a shortage of rolling stock. These conditions cannot go on indefinitely and sooner or later the railroads will be, literally, forced to purchase large quantities of lumber to repair and replenish their rolling stock. The financial uncertainty which exists, with its consequent liquidation of stocks and stagnation of business may account for part of the present quietness.

Conditions in the Southern producing districts are improving but it is expected that it will be at least another month before the amounts manufactured will approach anything like normal. When manufacturing does hit its stride, barring a shortage of labor, it is likely that the amount produced will be in excess of normal, as there are many small mills springing up and many of the larger operators who have in the past confined there efforts to special material, such as cooperage stock, are turning to the manufacture of general stock. Just what effect this will have on the market is probematical and will depend altogether on the demand. In the northern areas the strike has been a dismal failure and has practically petered out yet it has had its effect on the amount manufactured, with the result that the amount which would have been produced in the northern districts has been reduced five or ten per cent. This in spite of the continued strong demand. A conservative review of the whole situation leads to the conclusion that American hardwood stock will not be plentiful for the next few months, and there is every indication that prices are not likely to be reduced to any marked extent.

Well Known Lumber Representative Makes Change

Loren H. Pope, who for a number of years traveled for the Chas. F. Luehrmann Hardwood Lumber Company of St. Louis, Mo., calling on the furniture and wood working trade in Ontario, severed his connection with that concern on Nov. 1st, 1919, and now occupies the position of secretary and general manager of the L. D. Murrelle Lumber Company, 1524 Exchange Bldg., Memphis, Tenn.

Mr. Pope will not have the opportunity of coming in direct contact with his acquaintances in the Canadian territory, but he wishes to keep his name before his old customers and will be very pleased to serve them from his new connection, as in the past.

The L. D. Murrelle Lumber Company are very large manufacturers of Southern hardwoods, specializing in quartered white oak, poplar and gum.

Market for Small Turned Blocks Wanted

A subscriber has written asking if we could tell him where he can find a market for quantities of ends of turnings. These pieces are about 4 in. long, 1¼ in. square, with one end turned 1 in. long and ¾ in. diameter. Any reader who can use these pieces or can suggest where they might be disposed of to advantage is requested to co-operate and write the "Canadian Woodworker."

New Lumber Commissioner for the East

Lieut. Loren L. Brown, of Vancouver, B. C., who has been appointed B. C. lumber commissioner for Eastern Canada, as announced in the May "Canadian Woodworker", is expected to arrive in Toronto the first week in July and will immediately take up his new duties. Wm. Robertson, who has been filling

Lieut. Loren L. Brown, Vancouver B.C.

the position for the last few months, will, upon the arrival of Mr. Brown, leave for Victoria where he will resume his former connection with the forest department of the B. C. Department of Lands, Forests and Mines. Mr. Brown has both a practical and technical knowledge of the lumbering industry and should be in a position to assist any one who contemplate using B. C. forest products.

Manufacturing Southern Hardwoods

One of the newcomers in the southern hardwood field is the Frank A. Conkling Co., Memphis, Tenn. This firm was incorporated in May, 1920, with a capital of $50,000. Two mills are being operated, one at Percy, Miss., and the other at Issaquena, Miss. The annual prdouction of the two plants will approximate 15,000,000 ft. of southern hardwoods, principally red gum.

This firm controls one of the best tracts of virgin timber in the Mississippi Valley, and with modern logging and band mill equipment and all the departments of the organization under the direct supervision of an experienced management, they are in a position to produce and market high-grade southern hardwoods.

The officials of the company are all experienced lumber operators. G. W. Gary, the president, has had a wide lumbering experience. At one time he operated two mills of his own and, later on, with the Korn Conkling Co. of Cincinnati. Later he, with the Korn Conkling Co., organized the Triangle Lumber Co. and built a band mill at Percy, Miss., with a daily capacity of 40,000 ft. Last February Mr. Gary purchased the interests of the Korn Conkling Co. in the Percy mill, and, having previously acquired the Issaquena Co. at Issaquena, Miss., is now operating at both Percy and Issaquena.

The vice-president and general manager, Frank A. Conkling, first engaged in the lumber business in 1900 with the Farrin Korn Lumber Co., Cincinnati, Ohio. In 1912 he organized the Korn Conkling Co. of Cincinnati, and remained with that firm until 1919, when he disposed of his interests and organized the Frank A. Conkling Co.

The secretary, E. Austin Neely, is well known to the trade, having been connected with Michie Bros. Incorporated, and the E. Sondheimer Co., both of Memphis. Mr. Neely will devote a large part of his time to the sales end.

A. A. Volkert, the treasurer, was with the Farrin Korn Lumber Co. and the Korn Conkling Lumber Co. before being associated with this organization.

Woodturning Firm Expanding

The Woodturning Products, Limited, Fenelon Falls, Ont., have been expanding their activities. The plant of the Dominion Hardwoods Limited, Deseronto, Ont., was recently taken over and is being reorganized for the manufacture of broom handles. The drive is being changed from steam to electric. The squares for both the Fenelon Falls and the Deseronto plants will be cut at a sawmill, which has been purchased at Haliburton, Ont. Adequate timber limits were also acquired. It is the intention to confine the output of the Deseronto plant largely to broom handles and to manufacture all the smaller turnings, chemists' boxes, etc., at the Fenelon Falls factory.

Catalogs, New Publications, Etc.

The Marietta Paint & Color Co., Marietta, Ohio, have recently issued a small pamphlet, drawing the attention of their many friends to the fact that the American railway situation is delaying the receipt of raw materials and retarding the shipment of their finished products. The caption "Be Patient" is very appropriate.

The third edition of Banghman's "Buyer and Seller—Cost and Computation Tables" has just been issued. The book contains numerous tables for computing costs, interest, discounts, estimates, pay roll figures, etc., tons tables, distance charts, etc. In fact the book contains most of the charts and tables that might be required in the ordinary run of business. Full information and particulars may be had from H. R. A. Banghman, Indianapolis, Ind.

The Curtis-Hasey Dryer Co., Philadelphia, Pa., have issued an attractive catalog illustrating their Thermo-Myst system of lumber drying. The illustrations include typical layouts for the different classes of Thermo-Myst kilns. The catalog is in loose leaf form and the intention is to issue bulletins, which may be included in the catalog, covering different kiln drying problems.

The Canadian Machinery Corporation, Limited, Galt, Ont,. have issued an attractive wall calendar, dating from June 1920 to June 1921. Every second sheet is illustrated with some item of woodworking equipment taken from their line of up-to-date machines. Anyone desiring this calendar should communicate with the above mentioned firm.

The 1920 catalog of the Simonds Canada Saw Company, Limited, St. Remi Street, Montreal, Quebec, has just been received from the printers. Any saw mill or planing mill operator who has not received one of these catalogs will receive a copy on application. The complete line of Simonds saws and machine knives are listed.

With lumber commanding such high figures the small kerf of the band saw blade takes on an added importance.

The loose pulley of the machine which does the least work often makes the most noise.

SERVICE

means giving the very best that is in you. No word has been over-played in modern advertising copy more than the word "service." In practical use the word "service" has a relative significance. The advertiser who honestly desires to live up to his advertised service, naturally has as his goal 100% satisfaction in all particulars of his dealings with his customers.

In reality, though, that man who advertises service and then gives the very best in him in his struggle to make it 100%, is giving service in the true sense even though he fall down 33% from his expectations.

Frankly, that is exactly our position to-day. Faced with a tremendous demand for our products and a woefully short supply, on top of which were heaped unheard of weather and labor difficulties, we have not hesitated to invest thousands and thousands of dollars in new mills and new logging equipment, and have spared no effort to get loaded cars out. However, the best we could do was not adequate under the conditions. We are still behind although hopeful of again getting our heads above the mud and mire that all winter has deluged southern timberlands.

At least we can say we have given the best in us and will continue to do so until our service does finally go back to approximately 100% level.

Information and Inquiries

You are cordially invited to make use of this department

What Causes Case-hardening?

Bruce Station, Ont., May 31/20.

Editor "Canadian Woodworker."

We are building a small dry kiln 12 ft. wide, by 20 ft. long and 10 ft. high. What is the best way to ventilate this kiln so as to secure a good circulation for the drying of oak, birch and pine? What temperature should be carried for drying these woods and what causes lumber to case-harden?

Yours truly,
Beilhartz Bros.

About the only way to ventilate a small kiln of this type is to construct two ventilators, say 6 in. by 10 in. on each side, about 5 ft. from the ends. A number of openings, say three, should be made and each opening provided with a slide that can be closed, or partially closed, so as to regulate the circulation. Fresh air could be admitted through a long box placed under the heating coil and provided with sufficient small openings to give an even distribution of the incoming air. These openings might be fitted with doors or slides so the amount of air can be controlled. It is hard to give drying temperatures as the condition of the stock and the amount of humidity in the kiln must be considered. Oak might be started at 105 deg. and gradually increased to 140 deg. Birch started at 130 deg. and gradually increased to 160 deg. Pine started at 140 deg. and gradually increased to 185 deg. At the same time the humidity should be regulated and gradually reduced. Case-hardening usually occurs when lumber is dier in a kiln in which the relative humidity of the air is kept too low. In other words the air did not contain enough moisture. The warm dry air dried the outside of the stock before the centre had time to dry with the result that the surface set and dried hard in a strained condition. A wet and dry bulb hygrometer is required for determining the humidity of the air. An accurate set of scales should be provided for calculating the moisture content of the stock. The resaw test will show if there is any tendency to case-harden.

How Do You Handle Log Run?

Uxbridge, Ont., June 3, 1920.

Editor, Canadian Woodworker:

Would you be kind enough to find space in your publication for the following questions, which we hope a large number of your subscribers will answer, and which will be for the general benefit of all the woodworking industry.

In bringing log run lumber into the yard, which is the most economical, or from which plan can the best results be obtained:

1. To pile the lumber the full run of the log all together in one pile, taking for granted it is all one thickness.

2. Is it better, in unloading, to pile the lumber in separate piles, under the separate grades: No. 1 and No. 2 common, and Firsts and Seconds.

3. For a factory manufacturing phonographs and record cabinets, show-wood chairs and stuffover chairs, is it profitable to buy log run lumber.

4. Give experience in piling green oak, and how to be successful in getting it air seasoned without checking.

Yours very truly,
Gold Medal Furniture Mfg. Co.

There is room for a very profitable discussion here as the question asked covers a subject that is of vital interest to all wood users. If a large number of readers will reply outlining their experience and offering suggestions some valuable information should be forthcoming. Will you co-operate by replying today?

How to Prevent Bits Following the Grain

How to prevent the drills following the grain when boring holes through the pail handles is the problem of one large handle manufacturer. This boring is done in end grain and if the grain is crooked or crossed the bits have a tendency to follow the grain, and as a consequence the holes barely meet—the holes are bored from each end—in many instances with the result that it is not easy to put the wire handle through the hole. Numerous methods have been tried in an effort to overcome this trouble but seemingly in spite of all that has been tried the bits continue to lead sideways. Any idea that might lead to a solution of this problem will be welcomed. Send your suggestions in to the editor.

A machine may run as well with its stationary parts covered with oil and dust, but it does not look as well as one that is kept spick and span.

Dominion Disc Grinder

The most essential machine for the pattern shop. High grade, low price.

News of the Trade

J. R. Eaton & Sons, Limited, Orillia, Ont., are installing a Yates No. 281 band resaw.

The cabinet shop of H. Lalonde, Montreal, P. Q., was damaged by fire recently.

A. Plumtree is erecting a small sash and door factory on Fourth St., New Toronto.

The Plant Carriage Factory, Ottawa, Ont., contemplate erecting an addition at a cost of $60,000.

The property known as Steele's Planing Mill, Smith's Falls, Ont., has been converted into a button factory.

The Toronto Wood Finishing Co., 79 Adelaide St. E., have moved to larger premises at 1091 Queen St. W.

The Motor Saw Co. of Canada, Montreal, P. Q., was recently registered with Arthur R. Harris as proprietor.

An up-to-date upholstering shop has been opened in the Miller factory, Fredericton, N. B., by Thomas Chapman.

Mackisco & Sanderson, Reg., Lachine, P. Q., were recently formed to conduct a general woodworking business.

The Berliner Gramophone Co., Limited, Montreal, P. Q., have commenced work on a large factory to cost $400,000.

The Ontario Spring Bed Co., London, Ont., have awarded a contract for a small addition to their factory at a cost of $4,000.

N. D. McPhail, Vancouver, B. C., is reported to have disposed of his interests in the Province Furniture Mfg. Co. of Vancouver.

Seaman, Kent Limited, Toronto, Ont., manufacturers of hardwood flooring, are erecting an office and warehouse at a cost of $50,000.

The twenty-third annual convention of the National Hardwood Lumber Dealers' Association will be held in Chicago on June 17-18.

The plant of the McKay School Equipment Co., Limited, Toronto, was recently damaged by fire. The loss is fully covered by insurance.

A. Gill, St. Catharines, Ont., is equipping a woodworking plant and is in the market for a few machines, such as circular ripsaw, band saw, etc.

The Canadian Nashua Paper Co., Limited, Peterborough, Ont., are manufacturing a line of gummed tapes for taping veneer joints and other similar uses.

The Aubernaie, a wooden vessel of 1,500 tons, built for the French government, was successfully launched at the Davie Shipbuilding plant at Lauzon, P. Q.

The planing mill of Allen & Cline, Picton, Ont., was totally destroyed by fire. The loss, which amounted to $18,000, was only partially covered by insurance.

The Rhodes-Curry Co., Limited, Amherst, N. S., are building an addition to their plant at Sydney, N. S. Some new equipment will be added. Cost $4,500.

The Piercy Supply Co., Halifax, N. S., manufacturers of sash and doors and general woodwork, are building a warehouse and office at a cost of $7,000.

The Canada Clothespin Co. of Western Ontario, have installed a shavings exhaust system to take care of the shavings and sawdust from their clothespin equipment.

Ham Bros. Co., Limited, Brantford, Ont., manufacturers of refrigerators and screens, are building a three-storey brick addition to their factory at a cost of $20,000.

Potter's, Limited, Winnipeg, Man., contemplate erecting a furniture factory at St. Boniface, on the site formerly occupied by the Rat Portage Lumber Company's mill.

The Chamber of Commerce of Stratford, Ont., have issued an invitation to the Retail Furniture Association of Ontario, asking them to hold their next convention in Stratford.

The planing mill of Samuel Lambert, Welland, Ont., was recently damaged by fire. The loss which amounted to $5,000, was not covered by insurance. The cause of the fire is not known.

Walter T. Piggott, Windsor, Ont., has commenced the construction of a new planing mill and dry kiln, together with office buildings, etc., A short time ago Mr. Piggott disposed of the site on which the present plant is located and it was announced then that a new factory would be put up as soon as a suitable location was secured. The new building will be two storeys, 60 x 150, of mill and brick construction, and will cost in the neighborhood of $35,000.

The partnership known as Pollender & Frere, who have been conducting a sash and door factory at Farnham, P. Q., has been dissolved and E. & A. Pollender registered as proprietors.

S. E. Johnson & Son, Racine, Wis., have awarded a contract for a Canadian factory to be erected at Brantford, Ont., where they intend to manufacture their prepared waxes and wood stains.

Alp. Bavil, Shawinigan Falls, P. Q., is rebuilding the sash and door factory and saw mill that was destroyed early in the year. The new building is 2 storeys, 100 ft. x 40 ft., of concrete construction. Cost $15,000.

The sash and door factory of Neate & Co., Ottawa, Ont., was recently damaged by fire. The damage, which amounts to $1,000, will not interfere with the operation of the mill. About sixty hands are employed at present.

Work has commenced on the new woodworking plant that Gordon C. Scott is erecting on the West End sawmill site, Fredericton, N. B. A box shook factory and a cooperage plant will be operated in connection.

The London Brush Co. Limited, London, Ont., have been incorporated to manufacture and deal in brushes, brooms and other wood products. Capital $40,000. Two of the incorporators are F. Rossiter and F. G. Rossiter, both of London, Ont.

Fry & Blackhall, Limited, Wingham, Ont., were recently incorporated to manufacture and deal in all kinds of upholstered and other furniture. Capital $50,000. J. A. Mills and S. Bennett, both of Wingham, Ont., are two of the incorporators.

Leclerc & Beauchamp, Limitce, Montreal, Que., were recently incorporated to manufacture and deal in furniture, toys and other articles. Capital $45,000. J. E. Beauchamp, agent, and Gustav Adam, both of Montreal, are two of the incorporators.

The plant of R. E. Truax & Co., Walkerton, Ont., narrowly escaped destruction when a large roller-skating rink on the adjoining property was wiped out. As it was, a considerable quantity of lumber and the company's stables were destroyed.

The Regina Sash & Door Co., Regina, Sask., will erect a big mill plant here this spring to cost approximately $40,000. The mill will be fitted out with new equipment, will undertake all kinds of wood manufacture, and employ about fifty workmen.

La Librarie St. Jean Limitce, Victoriaville, Que., have been incorporated to manufacture musical instruments, toys, pencils and other wood products. Capital $20,000. E. Marchand and A. Marchand, both of Victoriaville, Que., are two of the incorporators.

The Brunswick Canadian Products Co. Limited, Woodstock, Ont., have purchased a large block of land adjacent to the ten-acre site granted by the city. This gives this company a very fine industrial site with connections with the Grand Trunk and C. P. R.

Canadian Motors & Machine Co. Limited, Quebec, Que., have been granted a provincial charter to manufacture motor boats, aeroplanes and other wooden vehicles. Capital $500,000. Two of the incorporators are T. Craig, W. Campbell, financiers, both of Quebec City.

The Port Arthur Shipbuilding Corporation, Limited, Montreal, Que., have been incorporated to build and deal in steamships, barges, tugs and other water craft. Capital $100,000. F. H. Markey and W. W. Skinner, both of Montreal, are two of the incorporators.

Francis, Limited, Port Arthur, Ont., have been granted a provincial charter to manufacture and deal in all kinds of musical instruments. Capital $40,000. Two of the incorporators are W. F. Langworthy, solicitor, and S. E. Flook, surveyor, both of Port Arthur, Ont.

The Collingwood Shipbuilding Corporation, Limited, Montreal, Que., have been granted a federal charter to construct and deal in steamships, barges, and other water craft. Capital $100,000. Among the incorporators are F. H. Markey and W. W. Skinner, both of Montreal.

The Amherst Pianos, Limited, Amherst, N. S., were signally honored when Queen Alexandra selected an Amherst piano, from their London warerooms, as a birthday gift to the Princess Royal. To celebrate this achievement the Board

The worker's smile is a big asset for you. Cultivate it!

Autograph Recorders
Secondary Clocks
Time Stamps
Key Recorders
Program Devices
Recording Door Locks
And a full line of kindred devices.

We will gladly send full data concerning any of the above instruments on request.

SHOW workers that their wages are infallibly protected for EVERY MINUTE of service given and you will establish a basis of understanding and harmony which can not be attained in any other way.

Such a positive guarantee of payroll accuracy and satisfaction is made possible by

INTERNATIONAL TIME RECORDERS

The confident smile of the worker who records his time on an International is a genuine asset for you. It means freedom from payroll disputes. It stands for close, profitable co-operation between employees and management. It is the mark of a satisfied, capable producer.

All manually-controlled timekeeping systems are subject to uncertainties. They depend for success upon unerring human attention—**and we humans are not unerring.**

Internationals, on the other hand, are **automatic.** They leave nothing to chance. They keep all necessary payroll data, correct-to-the-minute, clearly printed for quick, errorless computation.

Internationals are made in 260 models, either electrically-operated or spring-driven, and adapted to all lines of business. May we show you how YOUR requirements can be filled perfectly?

INTERNATIONAL BUSINESS MACHINES CO. LIMITED

FRANK E. MUTTON, Vice-President and General Manager

Head Office and Factory : 300 to 350 Campbell Avenue, TORONTO

Offices at
HALIFAX, 44 Granville St.; QUEBEC, 506 Merger Bldg.; MONTREAL, 1 and 3 Notre Dame St. W.; OTTAWA, 188 Queen St.; TORONTO, 415½ Yonge St.; HAMILTON, 175 James St. N.; WALKERVILLE, 44 Lincoln Rd.; WINNIPEG, 227 McDermott Ave.; SASKATOON, 254 3rd Ave.; CALGARY, 172 6th Ave.; EDMONTON, 10118, 102nd St.; VANCOUVER, 110 Water St.

(Also Manufacturers of Dayton Scales and Hollerith Electric Tabulators)

of Trade of Amherst held a banquet for the management and employees of the above-mentioned firm, at which laudatory addresses were given and a presentation made to each of the workmen. This consisted of a neatly engraved card and a $5.00 gold piece for each employee.

The Pacific Crating & Manufacturing Co., who are erecting a crating and broom handle plant on Sidney Island, B. C., is now operating the crating mill. Sufficient contracts have been accepted to keep the plant going for several years. About sixty men are being employed.

The Forest Products, Limited, Parry Sound, Ont., are erecting a two-storey brick factory 65 ft. x 162 ft. A new power house and dry kiln is also being equipped. This firm, which employs from sixty-five to seventy-five hands, specializes in sash, doors and millwork of all kinds.

The Toronto Specialty Mfg. Co. are nicely settled in their new plant at Bradford, Ont. About twenty-one hands are now employed but this number will be increased very soon. The output of this concern is confined chiefly to baby carriages and go-carts in reed and rattan.

The Hydrola Phonograph Co, Limited, Toronto, Ont., were recently granted a provincial charter to manufacture phonographs, and other musical instrumentss. Capital $200,000. G. H. Sedgwick and J. Aitchison, barristers, both of Toronto, Ont., are two of the incorporators.

Pacific Berry Growers Limited, Port Haney, B. C., have just completed the construction and equipping of a box factory to manufacture fruit and berry boxes. The capacity of this plant is sufficient to take care of the local demands and fill orders from other places outside B. C.

The British American Shipbuilding Corporation, Limited, Montreal, Que., was recently incorporated to manufacture, build and deal in steamships, barges and other water craft. Capital $100,000. Two of the incorporators are F. H. Markey and W. W. Skinner, both of Montreal, Que.

F. W. Anderson, 1056 Granville St., Vancouver, B. C., has purchased a site of 8¾ acres in Point Grey, B. C., and contemplates erecting a furniture factory at a cost of $25,000. The first unit of the plant will be proceeded with at once. Employment will be furnished for about one hundred hands.

Ideal Cabinets, Limited, Toronto, Ont., have been granted a provincial charter as general woodworkers, manufacturing and dealing in cabinets, furniture, musical instruments and all kinds of woodenware. Capital $40,000. J. M. Bullen and H. L. Steele, barristers, both of Toronto, are among the incorporators.

The Sea-Sled Company, Limited, Montreal, Que., have been incorporated to manufacture and deal in boats, aeroplanes and craft of all kinds. Capital $1,160,000. Among the incorporators of the company are Honorable William James Shaughnessy, and Chilion Graves Heward, both of Montreal, Que.

Burroughs & Company (Eastern) Limited, Montreal, P. Q., were recently granted a federal charter to carry on a business as paper and box makers and manufacturers of office furniture and supplies. Capital $50,000. Two of the incorporators are R. M. Edmanson, and W. G. Egbert, both of Calgary, Alta.

E. H. Shockly, Prince Rupert, B. C., has moved his woodworking plant to a more suitable site on the waterfront at Cow Bay. The new plant is equipped with a complete line of woodworking machinery. The products of this plant include general millwork, mouldings, building material and dressed lumber.

It is reported that H. R. Wansbrough of the Dominion Casket Co., Guelph, Ont., has purchased the building occupied by the Crowley Mfg. Co., Toronto, and intends to manufacture caskets. In all likelihood a company known as the Canadian Caskets, Limited, will be organized to conduct this new business.

The Dominion Boxes, Limited, Ottawa, Ont., have been incorporated and will take over the firm known as Boxes, Limited. The new company will manufacture chiefly boxes and other wooden products. Capital $250,000. Two of the incorporators are G. D. Kelly and W. L. Scott, barristers, both of Ottawa, Ont.

A very strong delegation of piano manufacturers, including representatives and employees from practically every factory in Ontario, recently waited on the Minister of Finance, Sir Henry Drayton, and made a strong protest against the new taxes. They intimated that if the present regulations were enforced their business would be cut in half, if not reduced further. They suggested that instead of an excise duty of 10 per cent. on ordinary pianos and 20 per cent. on players and phonographs, that this tax be reduced to 5 per cent. on all lines. The delegation were assured that the representations made would receive careful consideration.

The contract has been let for the new furniture factory that the Langslow-Fowler Furniture Co. of Rochester, N. Y., are erecting at Cobourg, Ont. The main factory will be 223 x 63 of brick construction, and a separate power house and dry kiln will be built. The cost will run in the neighborhood of $150,000 including equipment.

The Sterling Caskets, Limited, Toronto, Ont., have been incorporated to conduct a general woodworking business, manufacturing and dealing in caskets, hearses, and other undertakers' supplies. Capital $200,000. Two of the incorporators are F. A. Williamson, contractor, and P. Kirkegaard, engineer, both of Toronto, Ont.

At the first meeting of the Woodworkers section of the Manufacturers' Asscіation of British Columbia, held in Vancouver, Mr. A. Robertson of the Robertson-Hackett Sawmills, Limited, was appointed president, as this was the initial meeting of the newly-formed Association and the election of officers was the only business transacted.

The St. Thomas Cabinets, Limited, St. Thomas, Ont., recently held an open day when about one hundred and fifty citizens of St. Thomas visited their plant. Among those calling were Genet Bros., Richmond, Indiana, manufacturers of the Starr Phonograph. They pronounced the St. Thomas plant one of the best on the continent.

The Dominion Composition Furniture & Toy Mfg. Co., Limited, Victoria, B. C., manufacture furniture of all kinds but specialize particularly in ornamental composition articles made by a new process. The directors of this company are A. B. U. Robson, president and G. L. Asquith, vice-president, T. F. C. Salt, secretary-treasurer and Paul Beygrau, treasurer.

At a meeting of the Advisory Council for Industrial and Scientific Research, held in Toronto recently, it was stated that alcohol could be made to-day for 50c a gallon, whereas the present price of $11.00 was largely due to the heavy government tax and the large profits accruing to the distillers. This cheap alcohol can be produced from sawdust and pulp waste by treating with acids.

The plant of the Harriston Furniture Co., Harriston, Ont., was completely destroyed by fire, during a severe electric storm. The loss of $75,000 is only partly covered by insurance. This plant was recently taken over by Zeigler Bros. and was enjoying a good trade; in fact alterations and additions were planned for this summer. The future plans of the company are not definitely decided on.

Desks, tables and other furniture are being turned out at the Government cabinet shop at Edmonton, Alta. These articles are for the new agricultural school at Raymond, Alta. It has been found that the product of the Government shop compares very favorably with the regular commercial lines of furniture, and the authorities figure that they are effecting a saving by doing the work themselves.

The Dominion Lumber & Building Co., Orillia, Ont., who have been operating a plant on flooring, moulding and other building material for the past thirteen months, report that business has been exceptionally good and that the orders on hand and the business in sight augur well for the immediate future. A sash department is being added and such machines as a sash sticker, tenoner, mortiser and relisher are being installed.

The National Show Case Co., Limited, Toronto, who were recently incorporated to take over the business conducted as the Toronto Wood Specialty Co., have purchased the plant of Cameron & Campbell and are making additions and alterations, preparatory to moving into the new premises. The dry kiln is being remodelled, a small addition being built to the factory, and such machines as a planer, matcher, tenoner and saws installed.

Work is now in progress at the Cholberg Shipyard on the four wooden, lumber-carrying barquentines which will be built by the Victoria Shipowners, Ltd., a co-operative concern whose stock is held by the business men and public of Victoria. The vessels, which will be of four-masted type, and which will have a 2,400 tonnage, will be operated by the shipowners on their completion. The Federal Government is assisting the scheme to the extent of $700,000, while the company has invested $300,000. The Government's loan will

be repaid by the operation of the ships in the lumber-carrying trade. In laying the keel of the first vessel Premier the Hon. John Oliver expressed the belief that the present project was a forerunner of many similar enterprises in this

A movement is on foot below the border to create a better demand for union-made caskets. It consists of a proposal to amend the constitution of the United Brotherhood of Carpenters & Jointers. The amendment reads as follows: —"No member's legal heirs or wife's legal heirs will be entitled to beneficiary donations unless the deceased is buried in a coffin or casket bearing the label of the United Brotherhood of Carpenters & Joiners of America.

H. C. Slemin, managing director of the Office Specialty Mfg. Co., Limited, Newmarket, Ont., recently stated that he was well pleased with the volume of business being done by his company. He said that they were called upon to extend themselves to keep up with the many orders that were coming in, and although they were experiencing the usual trouble in securing an adequate supply of raw material, they had succeeded to date in maintaining deliveries.

The Canada Wood Specialty Co., Limited, Orillia, Ont., report that all departments are very busy and that the orders on hand will keep them going for many months to come. One large contract, on which they are working, consists of an order for parts for folding chairs. This order, which will fill quite a number of cars, is for export to Britain. A sawmill is being operated to supply their own requirements and about 1,250,000 ft., chiefly birch, will be cut this season.

Beatty Bros., Limited, Fergus, Ont., manufacturers of barn and stable equipment and woodenware of all kinds, have been authorized to increase their capital from $750,000 to $2,000,000. An additional amount of capital is required to take care of the increased business, both domestic and foreign, which is offering. They plan on making some changes and improvements to both the Fergus and London plants, and will likely spend about $150,000 in buildings and equipment.

The Malcolm & Hill, Limited, Kitchener, Ont., who recently acquired the plant of the D. Hibner Furniture Co., Limited, intend to confine their line to special bedroom furniture of exclusive design. In producing this line it is the intention to make exclusive use of Canadian birch lumber, with mahogany and walnut veneer panels in three colors, viz., mahogany, walnut and enamel. Henry Maxwell, formerly with Berkey & Gay, will have charge of the plant, while Fred Hansen of the Grand Rapids Chair Co., will conduct the finishing department.

A company known as the Hespeler Wood Specialty Co., Limited, Hespeler, Ont., was recently incorporated to manufacture and deal in hockey sticks, bent wood goods and other specialties, and to take over, as a going concern, the business carried on in Hespeler under the name of Dominion Wood Specialty Co. Capital $100,000. The very latest equipment for this class of work has been installed and they claim that they have one of the largest and best-equipped hockey stick factories in the world. O. Gryd and Z. A. Hall, manufacturers of Hespeler, are two of the incorporators.

The box manufacturers of British Columbia recently organized as a section of the British Columbia Division of the Canadian Manufacturers' Association as it was the feeling among the individuals that some such forms of association was necessary to enable them to co-operate in handling of not only domestic business but also the large amount of export trade offering. Many substantial orders have already been taken on and apportioned between the manufacturers according to the capacity of plant or the condition of their order books. The chairman of the new organization is Mr. R. B. Sharpe, of the Pacific Box Company, Vancouver.

Kalbfleisch Bros. Limited, with a capital stock of $150,000 and headquarters in Stratford, have been incorporated to carry on the business generally of manufacturers and repairers of automobiles, motor trucks, bicycles, etc., and planing mill proprietors, sawmillers, lumber dealers and general contractors. The new company is empowered to acquire and take over as a going concern the two businesses now conducted in Stratford, one by Henry Kalbfleisch and George Kalbfleisch in partnership under the name of Kalbfleisch Bros., machine shop and garage proprietors, and the other by Henry Kalbfleisch and Emil Kalbfleisch in partnership under the name and style of the Kalbfleisch Planing Mill, planing mill proprietors and lumber dealers.

A. H. Gilham, Toronto, has been appointed sales manager for the Engel Upholstering Co., Limited, of Waterloo, Ont. Mr. Gilham represented Walker & Clegg of Wingham, Ont., for a number of years.

Personals

J. H. Sherrard of Simmons Limited, Montreal, has been elected to the Executive of the Canadian Furniture Manufacturers Associations for the ensuing year.

Wm. Turnbull, Victoria, B. C., of the B. C. Department of Lands, Forests & Mines, together with M. A. Grainger, the chief forester for B. C., spent a few days recently in Montreal, Ottawa and Toronto.

G. A. Gignac of J. H. Gignac, Limited, Quebec, P. Q., lumber merchants and woodworkers, has been appointed a member of the Executive of the Quebec Division of the Canadian Manufacturers' Association.

J. R. Shaw, managing director of the Canada Furniture Manufacturers, Limited, Woodstock, Ont., was elected second vice-president of the Canadian Manufacturers' Association at the meeting recently held in Vancouver.

C. W. Murphy recently joined the sales staff of the Gall Lumber Co., Toronto. He spent several years overseas and took an active part in the Somme and other big engagements. Previous to enlisting he was with the Standard Chemical Co. at South River.

Matthew Brown, Toronto, who was recently appointed Canadian representative for the Thomas Hall Lumber Co. of Charlton, W. Va., has returned from a visit to the southern producing districts and reports that there is a steady demand for hardwood lumber of all kinds.

J. F. Alain, of the Victoriaville Furniture Co., Ltd., is a member of the executive of the Quebec Division of the Canadian Manufacturers' Association. Mr. Alain is also a member of the Industrial Development Committee formed to attract industries from other countries to the Province of Quebec.

Stanley H. Stirrup, the well-known English furniture designer, has severed his connection with Berkey & Gay and the Luce Furniture Co. of Grand Rapids, Mich., and will devote his time to bringing out new designs for Malcolm & Hill, Limited, of Kitchener, and the Andrew Malcom Furniture Co., Limited, of Kincardine.

Ald. E. R. Seabrook, London, Ont., was recently appointed manager of the London Art Woodwork Co., Limited. Mr. Seabrook has been very active in the business and political life of London and is well thought of by his fellow citizens as indicated by the fact that he headed the polls when he sought re-election this year.

Mrs. Eddy, wife of the late E. B. Eddy, who was the founder of E. B. Eddy Co., Hull, Que., the widely-known paper, match and fibreware manufacturers, has donated the sum of $300,000 to Dalhousie University, Halifax. The money is to be used in building Shireff Hall, a dormitory for the girl students of the University, which will be a memorial to Mrs. Eddy's parents.

At the meeting of the Toronto branch of the Canadian Manufacturers' Association the following woodworkers were elected to office:—Vice-chairman, R. H. Esson of the Otto Higel Co., Limited, manufacturers of piano actions; members of the executive council, A. H. Gourlay of Gourlay, Winter & Leeming, Limited, piano manufacturers Walter Laidlaw of the R. Laidlaw Lumber Co., Limited, lumber merchants and woodworkers; W. H. Shapley of the Sterling Action & Keys, Limited, manufacturers of piano actions; and George Valentine of the Massey-Harris Co., Limited.

Obituary

The many friends of T. Edgar Rathbone, of George Rathbone Limited, Toronto, will sympathize with him in the death of his wife, which took place recently at the family residence, 183 Westminster Ave., Toronto.

J. F. Peterkin recently passed away at his home in Toronto. Mr. Peterkin came to Toronto in 1851 and having artistic inclination took up the calling of a wood carver. He won a high place in this line, many of the carvings in tht old Government House, the University of Toronto buildings and on many of the lake steamers testifying to his skill. He is survived by his wife, one son and daughter.

Matthew Deans, president of M. & M. A. Deans, Limited, manufacturers of wagon hubs and lumber, Sprucedale, Ont., passed away on June 4th in his 85th year. The late Mr. Deans was one of Canada's pioneer lumbermen, having started his first mill sixty-three years ago at Dublin, Ont. After operating a number of years at Norwich and also at Waverley, he removed to Sprucedale some thirty-five years ago and founded the present business.

An Excellent Machine for Furniture and Cabinet Work

The "Famous" No. 16 Variety Saw Bench with boring and mortising attachment will do much to increase your output in your furniture and cabinet shops. Accuracy is a main factor in its operation, while the roughest class of work is handled with the same degree of efficiency.

Write us for further information regarding the "Famous" No. 16 Variety Saw Bench and many other machines that you may need and are included in our complete line of woodworking machinery.

Railways in China

Of 6,386 miles of railway in China in 1918, over 4,000 miles of main and branch lines were owned and operated by the government, these comprising 14 railways in 14 out of the 18 provinces. In addition there were 11 provincial and private railways, (some owned by mining companies) aggregating 425 miles and five concession lines aggregating nearly 2,300 miles. These figures are given in the report on the government railways by the Ministry of Communication, Republic of China, for the calendar year 1918.

Taking the 18 provinces as a whole, there are about 460 square miles of territory and 107,000 population per mile of railway. These figures compare with 40 square miles and 8,000 population for India, and 12 sq. mi. and 3,800 population for the United States. It is stated in the report that owing to the extent of wateways in China these average figures always will be higher there than in other countries.

The construction cost for the government lines has averaged $126,000 per mile, ranging from $80,000 to $145,000. There are only 13 miles of double track, but sidings and industrial lines raised the trackage to a total of nearly 4,300 miles. The equipment included 653 locomotives. Owing to the fact that equipment must be purchased abroad, the policy is to extend the life of the engines as long as possible by means of extensive repairs and renewals, rather than to purchase new ones. Operating expenses were 44 per cent. of operating revenues. The traffic consisted of 25,475,379 passengers and 18,551,684 tons of freight.

Italian Housing Activities

According to the U. S. Department of Commerce, the Italian Government has considered legislative bills designed to increase materially housing facilities throughout the Italian domain. Legislative assistance offered so far includes loans to building organizations, co-operative societies and municipalities; state aid to commercial, industrial and agricultural organizations in the production of houses for their own employees; complete exemption from customs duties of imported building materials; exemption from the normal tax and the super tax for houses coming within the definition of popular or economical houses, as well as popular hotels and dormitories constructed by the municipality for a period of twenty years; and the exemption of certain other buildings not of a luxurious character from the normal tax and super tax for a period of 10 years.

In aiding tenants and discouraging rent profiteering Government commissioners will be appointed in cities of over 100,000 habitants to see that tenants receive full protection afforded them by law in connection with the leasing of apartments, furnished rooms, etc., and in regard to eviction.

Water Powers in British Guiana

An investigation into the possible development of hydro-electric power in British Guiana has been made by Stafford X. Comber, M. Am. Soc. C. E., and Mr. Comber's preliminary report has been printed by the Government of British Guina. It records a remarkable piece of pioneer engineering investigation, for Mr. Comber had to proceed alone, at short notice, 150 miles into the vastness of the tropical Guina Jungle and secure his technical data with the assistance of only a few native Indians. The trip was made during the period of heaviest rainfall ever recorded in the forty years during which records have been kept. The report notes that the total amount of 24-hr. horsepower that could be developed on the three main rivers of British Guina from natural head, would probably be about 800,000 hp. It is understood that the provincial government is seriously considering the report with a view to the development of the more important and readily accessible powers revealed by Mr. Comber's investigation.

Traffic on British Canals

Strongly as the advocates of inland waterway transport press the case for putting the canal system in a position to handle a larger traffic, it seems to be widely felt that the outlay involved in the improvement schemes which have been put forward cannot be justified by the traffic possibilities. Perhaps the comparatively small expenditure involved in carrying out the scheme outlined in the report which Sir Maurice Fitzmaurice presented to the Canal Control Committee—the approximate cost was £4,000,000—might be authorized, but even this is doubtful. It is admitted that the cost of canal transport has in comparison with the pre-war period increased by about 200 per cent., so that in spite of the increase in railway rates there is still a considerable disparity in the operating costs of railways and canals, particularly in the low-grade traffic which forms the bulk of the leads on inland waterways. A review of the transport situation suggests the conclusion that for the time being at least the railway system can be relieved of only a comparatively small tonnage by the other transport agencies.

Water and Moist Air for Absorption Tests

Exposure to moist air has been found just as severe a test as immersion in water, in testing the absorption of moisture by wood through varnish and other coatings. In tests made recently at the Forest Products Laboratory, birch panels with various coatings were tested by exposure to moist air (95 to 100 per cent. humidity) and water, respectively, for periods of 17 days. The weight gained from the moist air exposure was practically identical with that gained in the water immersion; for example, a coating consisting of a filler plus three brush coats of spar varnish allowed 12.60 grams of water to pass per square foot of surface in water exposure and 12.25 grams in moist air exposure.

Teredos Work Under 40 lb. Pressure

Two wood-stave pipe lines through which the Union Oil Co. pumps salt water at Oleum, Cal., have been entirely destroyed by teredos which must have been drawn in through the centrifugal pumps and entered the wood staves from the inside. The pipe-lines were 10 and 12 in. diameter, respectively, and were operated under a pressure of 40 lb. per square inch. The pipes were damaged so badly that they had to be replaced. When detailed examination was made it was found that the teredos were in a thriving condition, some of them having attained a length of 8 in.

Sale of Lumber by Tender

Sealed tenders will be received by the undersigned up to Wednesday, the 23rd day of June, 1920, at the hour of 12 o'clock noon, for the purchase of a quantity of dry lumber consisting of approximately 400,000 feet of White Pine, 250,000 feet of Norway Pine, common and dressing grades, Spruce, Red American Oak and Birch.

The above lumber is of various grades and sizes and may be seen and inspected on the premises of the Department of the Soldiers' Civil Re-establishment, Speedwell Hospital, Guelph, Ontario.

The above lumber was purchased by the undersigned, subject to Government Inspection and grading, and will be sold by the undersigned subject to the same conditions and the said Government Inspection and Grading will be final as between the purchaser and the undersigned, but purchasers will be at liberty to have their own inspector go over the lumber with the Government Inspector, at time of loading.

Tenders will be received for any grade or for all grades and for any quantity not less than one car-load. Prices must be for board measure, f.o.b. cars, Guelph, Ontario, and subject to sight draft against Bill of Lading.

Each tender must be accompanied by a certified cheque for 10% of the amount of the tender made payable to Torno Lovitz Lumber Company. These cheques will be returned to the unsuccessful tenderers when the contracts are awarded. The cheques of the successful tenderers will be retained until the completion of the contract as a guarantee of the proper execution thereof and will be subject to forfeiture in the event of the purchaser's default.

The highest or any tender not necessarily accepted

Purchasers must give shipping instructions to the undersigned within five days after acceptance of tenders.

A complete list of the said lumber may be had upon application to the undersigned at Room 200 Crown Office Building, Toronto, on personal application or upon request by mail.

DATED at Toronto, this 1st day of June, 1920.

TORNO LOVITZ LUMBER COMPANY,
Room 200, Crown Office Building, Toronto.

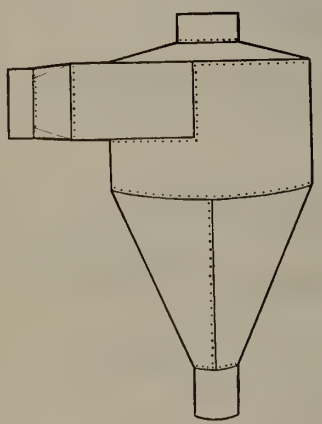
How about your Shaving Sawdust and Dust Collecting System?

Is It Right?

You cannot afford to equip your factory with a refuse collecting system that is always giving you trouble and out of order most of the time. It is a waste of money and a big expense for operating.

You will save money by consulting us. Our systems are scientifically designed and constructed to give continual and satisfactory service.



If your present is giving trouble or if you are contemplating a new one, write us for particulars.

THE COWAN TRANSVEYOR SYSTEM — IT REVOLUTIONIZED FACTORY TRANSPORTATION

Man Power, Plus

SHORTER hours, higher wages, scarcity of labor,—your problem! Conserve man power by using the Transveyor System of Trucking and Storage. Inexpensive to install, but costly to do without. Used for years by the leading manufacturers in practically every line of business. You need it.

The all-steel Lift Truck and the separate loading platforms will help speed up production, increase free floor space, and cut down labor costs. The Transveyor makes light of hard work and is built to stand constant use and abuse.

I am interested in reducing the cost and increasing the efficiency of hand trucking. Send a copy of "HOW TO APPLY THE TRANSVEYOR TO YOUR BUSINESS."

NAME ... ...

ADDRESS ... ...

TRANSFERS

Various items passed on to the Factory Manager for his perusal and profit. Your experience with the Transveyor System is invited.

HANDLING PARTS & PIECES

FOR storage and movement among different departments of small parts, a box-skid like the drawing herewith is recommended. These boxes are easily put together by any factory carpenter and serve many useful purposes. The weight of the box being shown, the net weight of the contents can be instantly secured without the necessity of removal. The Transveyor meets all conditions, and the construction of the skids fits it to the varied requirements.

THEY AUTO PLEASE

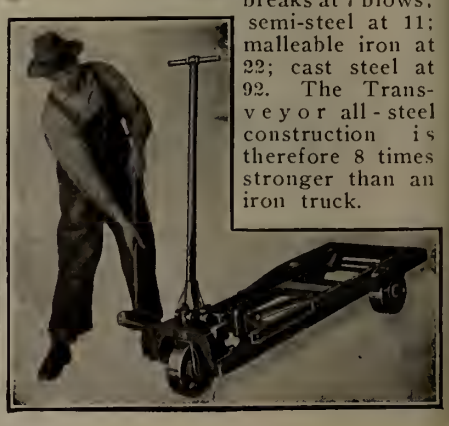
THE Winton Co. say that six Cowan Transveyors are saving $5,280 a year for them on their factory trucking. The Republic Motor Truck Co. reports that the Transveyor Lift Trucks cut their interior trucking expense 90%; saving $5,400 a year, or over $16,000 up to the time of writing.

"FIRE PROOF"

FIRE wrecked the Puritan Rubber plant, and down with the burning mass plunged a Transveyor into the cellar. The fire burned for 24 hours. The Transveyor was eventually dug out, with paint missing, but otherwise perfectly workable. It was put to work clearing up the mess. They say the "durn thing" looks as if it will still outlast its original guarantee period of 5 years.

SLEDGE HAMMER TEST

OF course no user of a Cowan Transveyor will deliberately try to scrap it with the aid of a sledge hammer. Nevertheless, a device of this kind must encounter many severe blows in the course of daily use. The All Steel construction of the Transveyor will stand these without serious effect. Actual breaking tests on bars of given sizes, show that cast iron breaks at 7 blows; semi-steel at 11; malleable iron at 22; cast steel at 92. The Transveyor all-steel construction is therefore 8 times stronger than an iron truck.



NAPCO WATERPROOF GLUE

No wastage

Applied cold—and mixed cold

Profitable in its saving

Consistent in all grades of work

Odorless in the glue room

NAPCO is absolutely uniform. It eliminates waste, is easily applied, is impervious to water, and never lets go.

NAPCO joints are as strong as the wood.

It's the whole secret of the

Automatic Operation

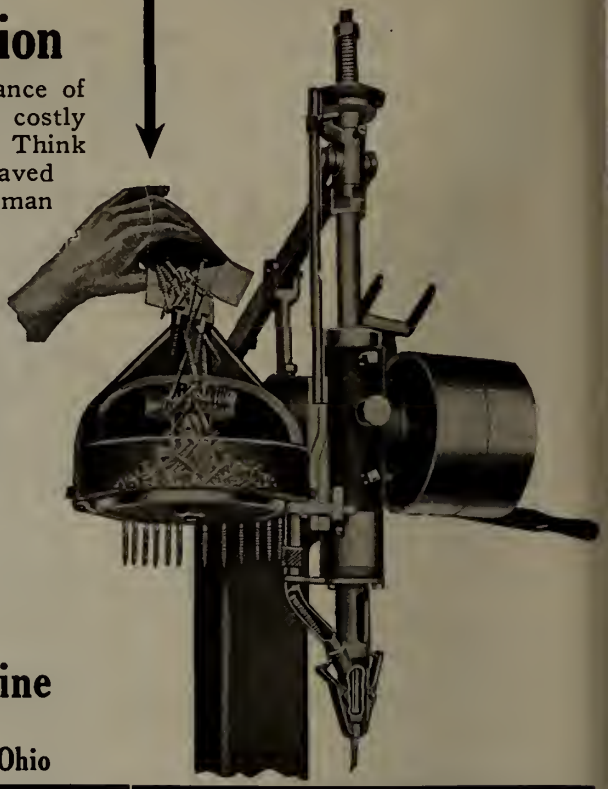
What a step it is in advance of the old style, man-tiring costly way of driving screws! Think of the amount of labor saved when any inexperienced man or boy can drive as many as 18,000 screws (wood or machine) in a day. Reynolds Automatic Screw Driving Machines are made in many different sizes and types to do almost any kind of work where a quantity of screws are to be driven. Special machines for almost any special kind of screw driving work will be supplied—just tell us what it is you want to do.

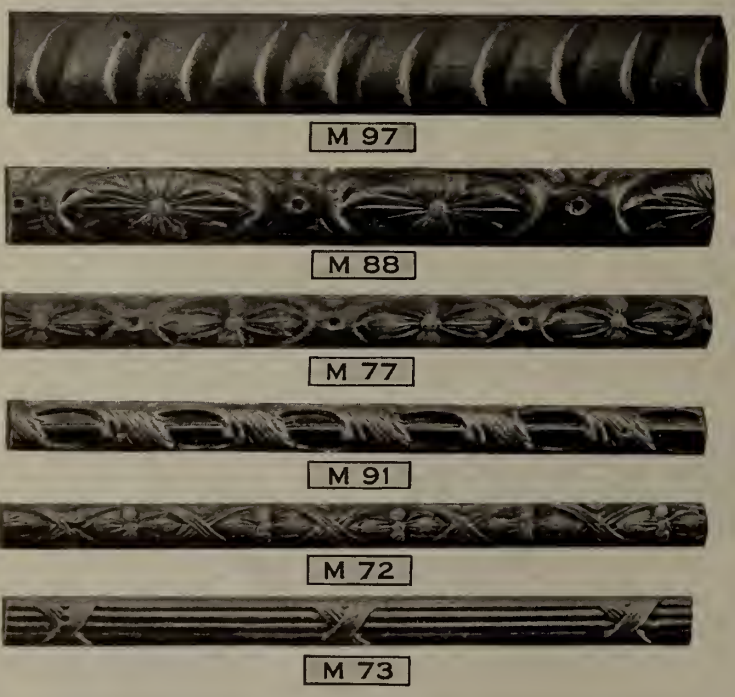
The Reynolds Machine Company

Dept. C. Massillon, Ohio

Just a Simple Operation

All you have to do is dump a box of screws into the magazine and start the machine. Both hands are always free to handle the work.





MOULDINGS We are making more Period Mouldings than ever before. Orders should be placed early to assure your supply when needed.

KNOBS The Period Knobs we placed on the market a few months ago are proving very popular. If you have not received samples ask for them now.

ROSETTES A new Period item to accompany the knobs.

Waddell Manufacturing Company

Coldbrook and Taylor, N. W. **Grand Rapids, Mich.**

HOW DO YOU DRIVE WOOD SCREWS?

The Automatic Electric Screw Driver is small. It weighs only 6 pounds and everything larger than this is impracticable for driving wood screws.

With an automatic your men can drive screws all day long and not get tired out and it will do the work so much faster than the hand brace, that you will be putting two-thirds the men now driving screws on to more profitable work where their skill will count.

Ask for Bulletin 1 now and learn how to drive wood screws the MODERN way.

The Sidman Lumber Curing Kiln

IS DESIGNED and built on STRICTLY SCIENTIFIC PRINCIPLES, toned down by years of practice to achieve the following results:
BUILDING: The simplest and best. Nothing wasted on looks, but built to last.
PIPE WORK: The cheapest to construct, and the best system of heating coils in dry kiln use. No cumbersome expensive headers with stiff expansion pipes, but PLAIN circulation, so arranged to give the maximum of heat, and take care of the expansion.
VENTILATION: POSITIVE CROSS VERTICAL. The only system of ventilation used in any kiln that the outside weather can NEVER INTERFERE WITH.
HUMIDITY: ABSOLUTE CONTROL, at any predetermined per cent. desired.
FLEXIBILITY: The entire operation of the kiln is so flexible that every kiln we design can PERFECTLY CURE any lumber from 5 in. oak, green from the saw, to quarter inch veneer.
OPERATION: Takes less time and can be learned easier than any other.
DESIGN: EACH and EVERY kiln designed for EACH CLIENT to suit his exact needs.
REFERENCE: EVERY USER. Let us send you a partial list.

Cut Miles without Grinding

A Characteristic Experience

Richmond, Indiana.

G. M. Diehl Machine Works,
Wabash, Ind.

Gentlemen:—

You may possibly be interested in an experience which we had recently in our factory with your Diehl Heads and Cutters.

Our Sticker man recently made a run of 10,000 stiles, each piece being 73 inches long, of hardwood, in which we cut a groove ¼ inch wide by 9/16 inch deep, and we made the entire run without taking the Heads or Bits off the machine and without resharpening, which makes a total run of a little more than 11½ miles. The Bits would, no doubt, have run quite an additional number of feet before it would have been absolutely necessary to sharpen them. We consider this a very good performance, especially in view of the fact that these stiles were all run from the rough wood and the Heads being used on a four-sided Sticker

Very truly yours,

RICHMOND FURNITURE MFG. CO.,
Per O. H. BRUBAKER, Manager.

Goodyear Belting keeps this cement mill at highest efficiency

Troublesome Small Pulleys

Have you trouble getting belts flexible enough for small pulleys, yet strong enough to last?

Goodyear has produced Extra Power Belting—belting flexible enough that it need not be too tight! Gripping enough to prevent slipping at any speed!

For this is 5-point belting.

1. It is extremely strong, because of specially-designed, properly-woven fabric.

2. Yet it is very flexible, for it is not stitched, but is welded together with high-grade rubber, forced through and through the fabric and surrounding every thread. It hugs even small pulleys.

3. It has a friction surface which *grips*, dry or damp, and needs no dressing.

4. It has a seam *sealed* tight with high quality rubber.

5. The same rubber which gives Goodyear Extra Power its flexibility, prevents ply separation, even when the edge is worn or torn by shifters or accident.

The list of satisfied users of Goodyear Extra Power Belting on small pulleys is very great—too long to print here. But a few are:

O'Neil Morkin Machinery Co., Edmonton, Alta.
MacEachern Milling Co., Wetaskiwin, Alta.
Silber Standard Mining Co., Ltd., New Hazelton, B.C.
Hollinger Consolidated Gold Mining Co., Timmins, Ont.

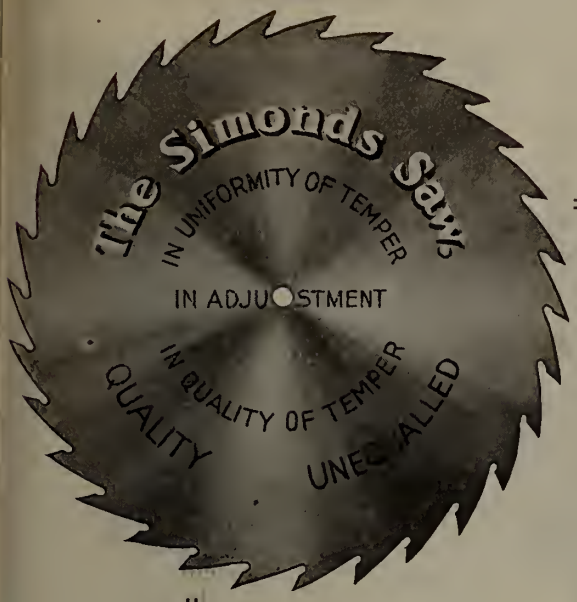
EXTRA POWER BELT



SIMONDS
CIRCULAR AND BAND
SAWS

In every mill or woodworking shop in the land the demand for greater production is urgent. Devious methods to secure the desired results are being tried out. Some are making good—some are not. They have the man-power, but they can't get production. Many mills and woodworking shops have discovered one of the greatest hindrances to efficient operation are poor saws and knives. The saws dull easily and do not hold their tension, while the knives lose their cutting-edge quickly and this results in unsightly marks on the lumber, and consequently damage.

Inferior saws and knives are being discarded by many, and in most cases Simonds Products are replacing them. There is no question about Simonds Saws and Knives. They are made of the finest steel obtainable, hardened and tempered right and made mechanically perfect. They produce smooth lumber and cut down your operating expense.

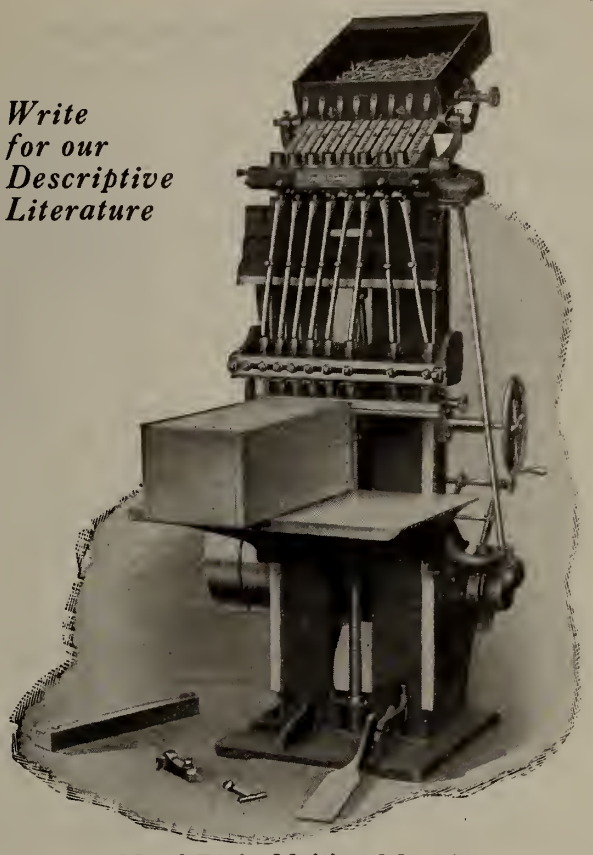
How do YOU Drive Nails?

Write for our Descriptive Literature

The Morgan Automatic Nailing Machine will prove a good investment for any woodworking plant. It drives nails anywhere and in any kind of wood, accurately, effectively and faster than it is possible to do it by hand. It makes money for Box Factories, Canning Factories, Cabinet Factories, Furniture Factories, etc.



No. 8 Plain Nailing Machine

Morgan Machine Co.

DEPT. A ROCHESTER, N.Y.

OLSON FRAME EXTENSION

Increases Service Reduces Costs

Just a Few Users—

Robert Bury Co. Canada, Limited, Toronto, Ontario.

Batts, Limited, Toronto, Ontario.

Gibbard Furniture Company, Napanee, Ontario.

Langmuir Manufacturing Company, Toronto, Ontario.

Gardiner Lumber Company, Galt, Ontario.

Irvin Lumber Company, Toronto, Ontario.

The Olson Frame Extension will mean increased carrying capacity for each of your Ford Trucks. They insure smooth running, perfect balance and easy operation that will prove ideal for the transportation of lumber, furniture, etc., for short or long distances.

Olson Frame Extensions are sold by all Ford dealers. Our nearest branch will be pleased to furnish you with further particulars.

Swedish Crucible Steel Co. of Canada, Limited, Windsor, Ont.

Branches:—614 Excelsior Life Bldg., TORONTO. 285 Beaver Hall Hill, MONTREAL.

) and 60-in. Automatic
Knife Grinders,
and New, at
One-half Price

Machines arranged for Motor Application as per cut, or regular belt drive, if wanted.

New Andrew Mutiple Vertical Borers, 20, 30, 42 and 60-in., any number of heads.

New Hermance Molders, 8, 10 and 12-in., stationary and slip-on heads.

and rip saw, Fay & Egan, 42-in.
and saws, 32, 36 and 38-in.
orer, Andrew, 10-ft., 13-spindle, power table.
orers, Andrew mult. vert., 20, 42 and 60-in., new.
arver, 5-spindle, Moore.
oor clamp, Fay-Egan, heavy.

Edgers, two, three and four saws.
Glue cookers and retainers. Glue spreaders.
Hogs, two, Mitts & Merrill.
Jointers, 8, 12, 16, 20, 24 and 30-in.
Knife grinders, two 32-in., F. & E.
Lathe, Ober spoke and handle, almost new.
Lathes, Mattison, No. 8 auto; No. 6 block mach.
Lathes, speed, eight, mounted on iron bed.
Lock-corner machine, Morgan No. 8, full set.
Matcher, American Northwest, 24x8-in., 3 sides.
Matcher, end, Sherman, fine condition.
Matcher, 24x6-in., 3 and 4 sides.
Automobile spoke machines, Defiance, complete set.
Band resaw, 50-in., Fay & Egan, tilting rolls, full set of filing room tools.

Molder, Smith 14-in. outside, latest style, practically new.
Molders, 4-side, 9, 10 and 12-in. American.
Molder, Fay & Egan No. 184, 12-in. outside.
Molders, inside, 13-in. American and Woods.
Mortiser and router, Fay & Egan No. 124.
Mortiser, chain saw, New Britain No. 1, 25 chains.
Mortiser, chain saw, New Britain No. 7, new.
Mortisers, F. & E. vertical, hollow-chisel; also plunger type.
Nailers, two, Morgan No. 8, used three months.
Nailing machines, 2 closed back, 4-track, 4d, 15-in. spread.
Pony planers, 16, 20 and 24-in.
Relisher and mortiser, Greenlee.
Rip saws, self-feed, Hoosier, F. & E., Greenlee.
Router for stair stringers, H. B. Smith, flexible arm with adjustable table and forms.
Sand belt, closet seat and similar work.
Sander, H. B. Smith, spindle and disc, practically new.
Sanders, 30 and 42-in. Columbia; 30, 42 and 48-in. Invincible; 30-in. double Invincible.
Saw, 8-ft. double cut-off, roller table.
Saws, combination and variety, single and double arbor, also tilting arbor, stationary and tilting table, 24 and 30-in. circular resaw.
Saw, circular re-slab, 40-in. blade, power feed rolls.
Shapers, Fay single-spindle reversible, also Shimer single with overhead routing attachment.
Surfacer, 30-in. double, cabinet, B. & M., practically new.
Surfacer, Whitney 30-in. double, sectional roll and sectional chipbreaker; American No. 4½, 36-in. sectional and solid; Fay & Egan No. 140, 27 and 30-in. double divided rolls; also 18, 20, 24 and 30-in. single cylinder panel planers.
Tenoners, B. & M. double-end, also several single-end tenoners with and without copes.
Timber sizer, Fay-Egan 4s, 17x12-in.
Window frame machines, Smith & Phillips combination.
Wood-worker, universal, Fay & Egan and Bentel & Margedant. One lot of glue room machinery.

ATKINS

STERLING QUALITY

SAWS and KNIVES

mean continuous, efficient work and 100 per cent. production.

The extraordinary demand for more buildings and homes means that the Lumber output must increase.

Atkins Sterling Quality Saws and Knives will assist you in making the year 1920 the biggest and best in the history of your business.

Write to-day for our Knife Booklet "C W" and Pattern Template Paper.

E. C. ATKINS & CO.

Makers of Sterling Saws

Factory—HAMILTON, Ont. **Vancouver Branch—109 Powell Street**

More Legs--Less Hands

One man on a Mattison Lathe can turn out as many legs per day as can be produced by ten hand-turners.

On the MATTISON LATHE, it does not matter whether the shape to be turned is plain or complicated. The most difficult square, oval, octagon, or hexagon pattern can be produced just as easily as the plainest round turning.

The work comes from the machine smooth and uniform without any of the grain in the stock being torn out, or the corners or fine members being broken off.

You are invited to send for a circular of the new Model "Mattison." It describes the heavier construction; the new cutterhead, and other improvements.

Model 1-D Portable Drill

HANDY—ECONOMICAL—EFFICIENT

Specifications:

Length—10 inches.

Weight—4¾ pounds.

Capacity—Steel, 0 to $\frac{3}{16}$". Wood and alloys, 0 to $\frac{13}{32}$".

Motor—Universal, on either direct or alternating current.

Diameter of Motor—3⅜ inches.

Spindle—Offset from center $\frac{3}{4}$".

Helical Gears.

Aluminum Handle.

Complete with 10-ft. cord, plug, switch and chuck.

Jacob's Chucks used as a regular equipment.

FOR speed in drilling and countersinking small holes, this tool is just what you need. It can be used on any kind of material—steel, iron, brass, aluminum or wood—and gives lasting service.

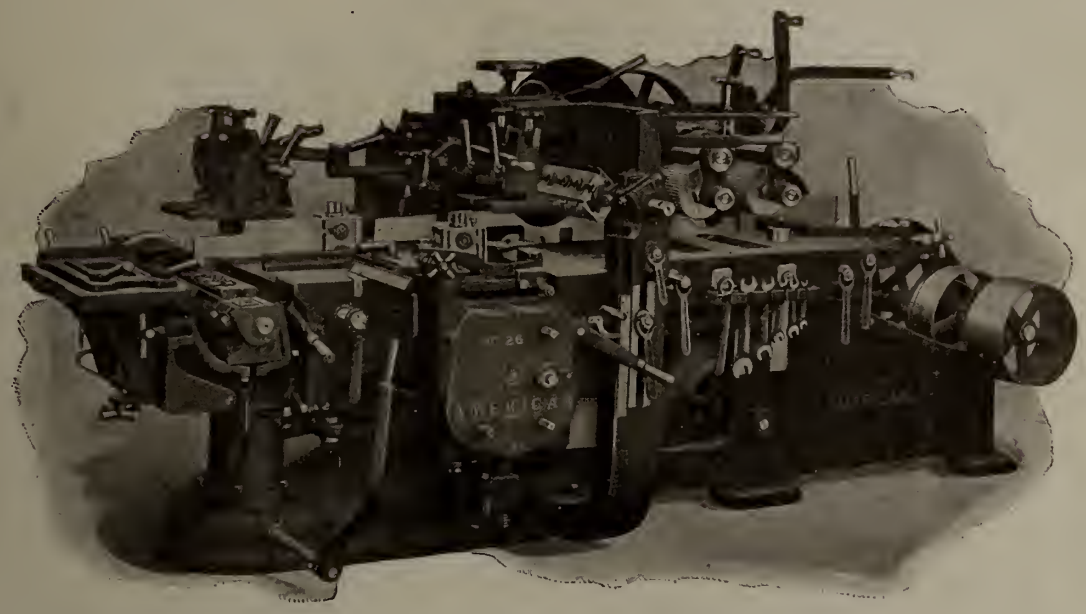
If your dealer cannot supply you with the Model 1-D, tell us about your requirements.

Wisconsin Electric Company

7125 Sixteenth Street, Racine, Wisconsin, U. S. A.

DUMORE GEARED ELECTRIC DRILLS

American No. 26 Four Sided Outside Moulder



A fast-feed machine—slip on and off heads—quick adjustments—heavy type—chip-breaker throws back out of the way when applying or changing cutters—Large size feed rolls with chain drive—and many other improvements which make possible quicker setting up and operation on this outside Moulder.

American No. 25 Edging Saw

Large size arbor and pulley allows high speed with plenty of power. Two chains in table and four sets upper feed rolls. Strong and accurate feed. Owing to arrangement of upper feed rolls very short stock can be fed through this machine. Compact, but with strength in every line and dimension.

Both of these machines for delivery from our Toronto warehouse.

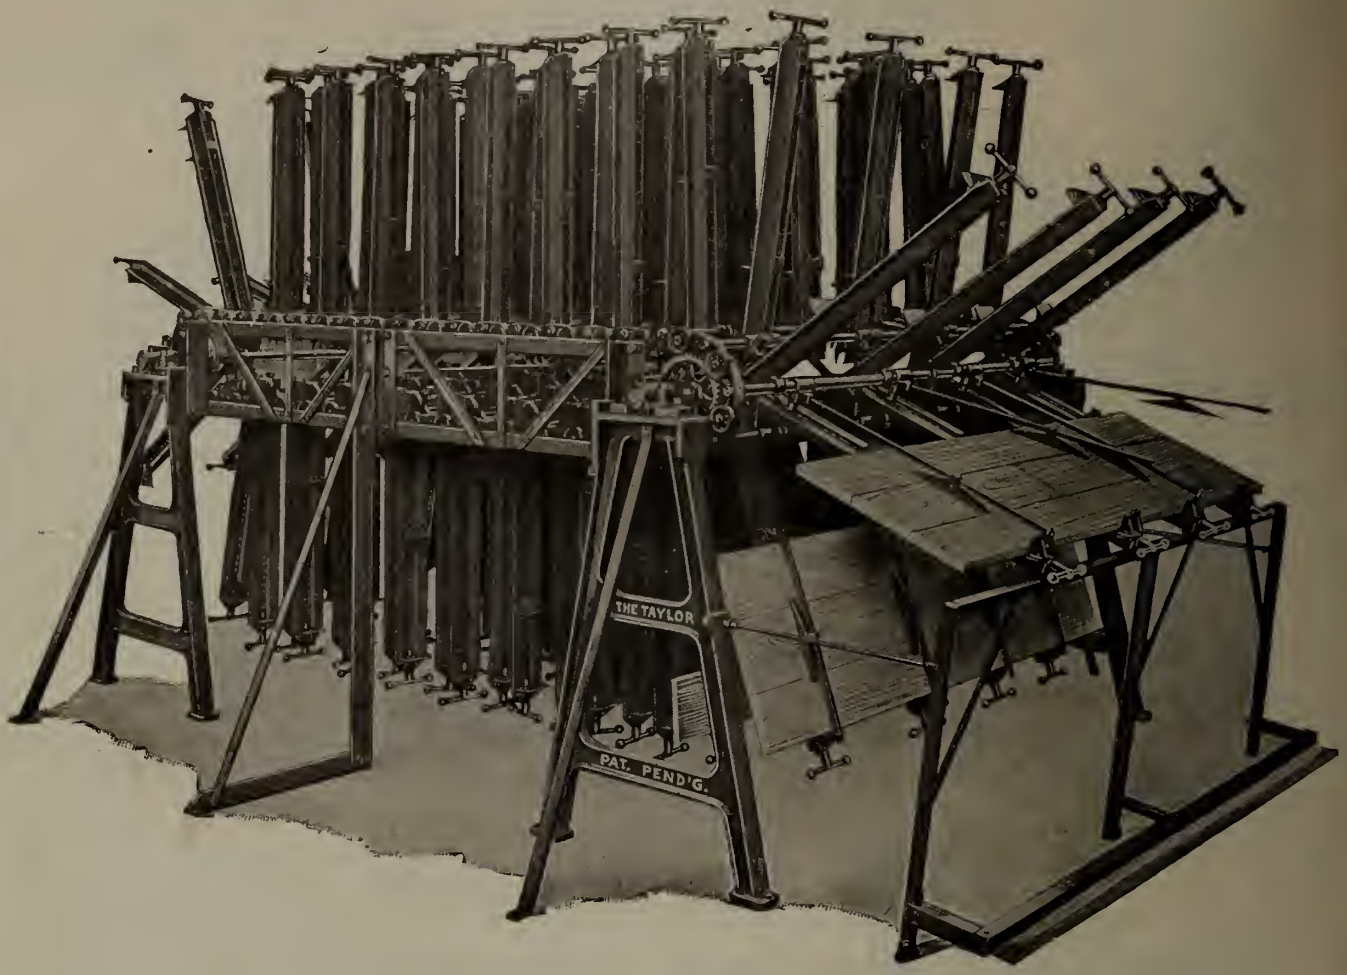
MONTREAL TORONTO WINNIPEG

"Everything in Machinery"

CLAMP The Taylor TRADE MARK CARRIER



Forty section machine carrying 160 clamps, measuring 8 ft. 2½ in. between shaft centers.

The clamp is one of the most interesting features of the clamp carrier. A remarkable strain can be applied with greatest ease; the work it turns out—both thick and thin stock—is 100 per cent. perfect.

An Engineering concern recently wrote:

"I am recommending Taylor clamps to the Germain Mfg. Co. because I have proven the clamps more efficient through scientific time studies on both and all existing types of gluing-up machines and devices."

As a result of the above recommendations, The Germain Mfg. Co. referred to bought two Taylor carriers. They installed them, and tested them and have since purchased two more. We can tell you numerous instances where customers are using from two to nine Taylor carriers each as a result of similar experiences.

Let us prove the truth of these claims by showing you one of these carriers in operation, or you can try the clamps out on your own work. Ask for C. C. Folder and further information.

The Connecting Link

-between Fine Forests and Fine Product

"The Invariable Choice of the Man Who Knows"

Yates

The Connecting Link

Between the raw material and the finished product are many steps in transformation, links in a chain. But one link is always of vital consequence. In the chain from saw log to surface finish there is one link that it is expensive to leave out. It is a Yates Type B-2 Surfacer. We have literature setting forth the reasons why. Send for it today.

Will do the work of Five Hand Jointers in making Glue Joints

This is the guarantee given with our

No. 4 Continuous Feed GLUE JOINTER

Strongest and most complete machine on the market.
Any part may be readily removed or renewed.
Feeds in opposite direction, giving 100 feet per minute.
Works material from six inches up to any length desired.
Also from one quarter to 3 inches thick, and from three-quarters of an inch wide up to any width.
1 set Shimer Special Jointer Heads supplied with machine.

Investigate the merits of this machine—it will pay you!

Jackson, Cochrane & Company

KITCHENER - CANADA

SIXTY YEARS

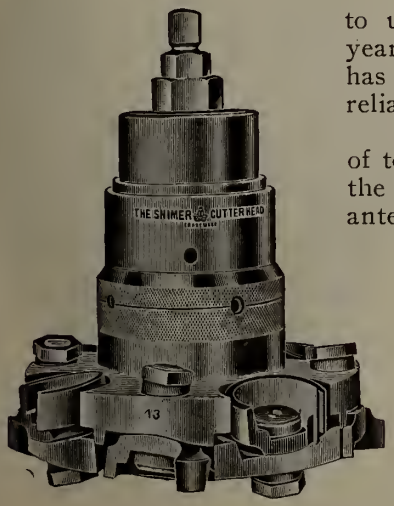

Fig. 627

The name "Shimer" has been quite familiar to users of woodworking machinery for sixty years. The reputation of Shimer Cutter Heads has withstood the severe test of time, and their reliability is unquestioned.

The cutter shown is turned to cut the shape of tongue and groove desired, so that to sharpen the cutter, it is filed or ground on its face, guaranteeing the user the same shape of cut during the life of the cutter. The cutter being fastened to a concave seat on a compound angle, assures the user of the proper clearance of cutters, consequently they never burn.

These heads are fitted with or without self-centering sleeve, and made expansion or solid, to suit the customer's wishes.

Write for Catalogue.

SHIMER CUTTER HEAD CO. OF CANADA, LIMITED

SUCCESSORS TO SAMUEL J. SHIMER & SONS, Inc.

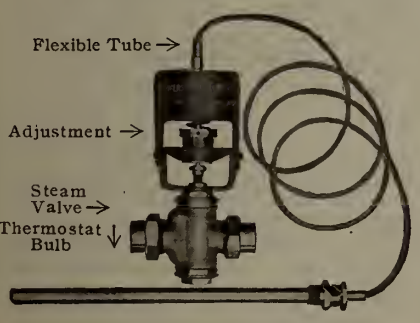
GALT, ONTARIO

"Come on, Bill, give us a hand."
"Can't! Have to watch this temperature."

A highly paid man made into a watcher instead of a worker. Labor is so scarce and costly, each man should be made to **produce.** Don't let him do automatic work that a machine can do.

The Powers Automatic Heat Regulator

Wherever temperature control or heat regulation is necessary, there is a Powers Automatic Heat Regulator made to just fit the requirement.



The Powers Regulator No. 11

This Regulator is self-contained, requiring no outside power for operation. Automatic, reliable, accurate. Specially adapted to the control of liquid temperatures in hot water tanks, glue kettles, acid baths, etc. Get our Bulletin 129.

This simple, scientific appliance, once installed, stays on the job every minute and releases high-priced men for work that a machine can't do.

Don't keep Bill watching the temperature. He's human, and he might **forget** to "turn 'er off."

Tell us your heat control problem, and we'll send you the type you require. If it doesn't make good in thirty days, send it back and we will cancel the charge.

W. S. HAWKER.

Inventor and Designer of the World's most efficient Tubular Turning Machinery

THE

Money Maker Adjustable Rod

and

Dowel Machine

The machine that is sent under a guarantee to show you a gain of from 100 to 400 per cent. before you buy it.

The improved dowel machine that 90 per cent. of the largest and oldest machinery builders and dealers now endorse and recommend in preference to the solid chuck machines they themselves previously built.

One cutter head turns from 1/4 in. to 2 in. diameter.

Turns hard or soft wood equally well.

Handles heavy, oversized squares.

No choking of the cutter head.

Smooth stock.

Accurate sizes.

Works stock as short as five inches.

Rolls automatically centre variations in squares.

Machines built to turn from 1/8 to 6 in.

We want to hear from every user of a solid chuck dowel machine.

We can save you from one dollar out of every two, to four out of every five, that the operation of solid chuck machines costs you.

Engagements for competitive test solicited.

Formal orders not solicited. All sales made after demonstration.

The only question is, are you willing to cut cost of your dowel turning to one-half or one-third of what it costs with any make of solid chuck machine?

Machine delivers the goods before you buy.

State conditions of stock closely.

Special conditions require special equipment.

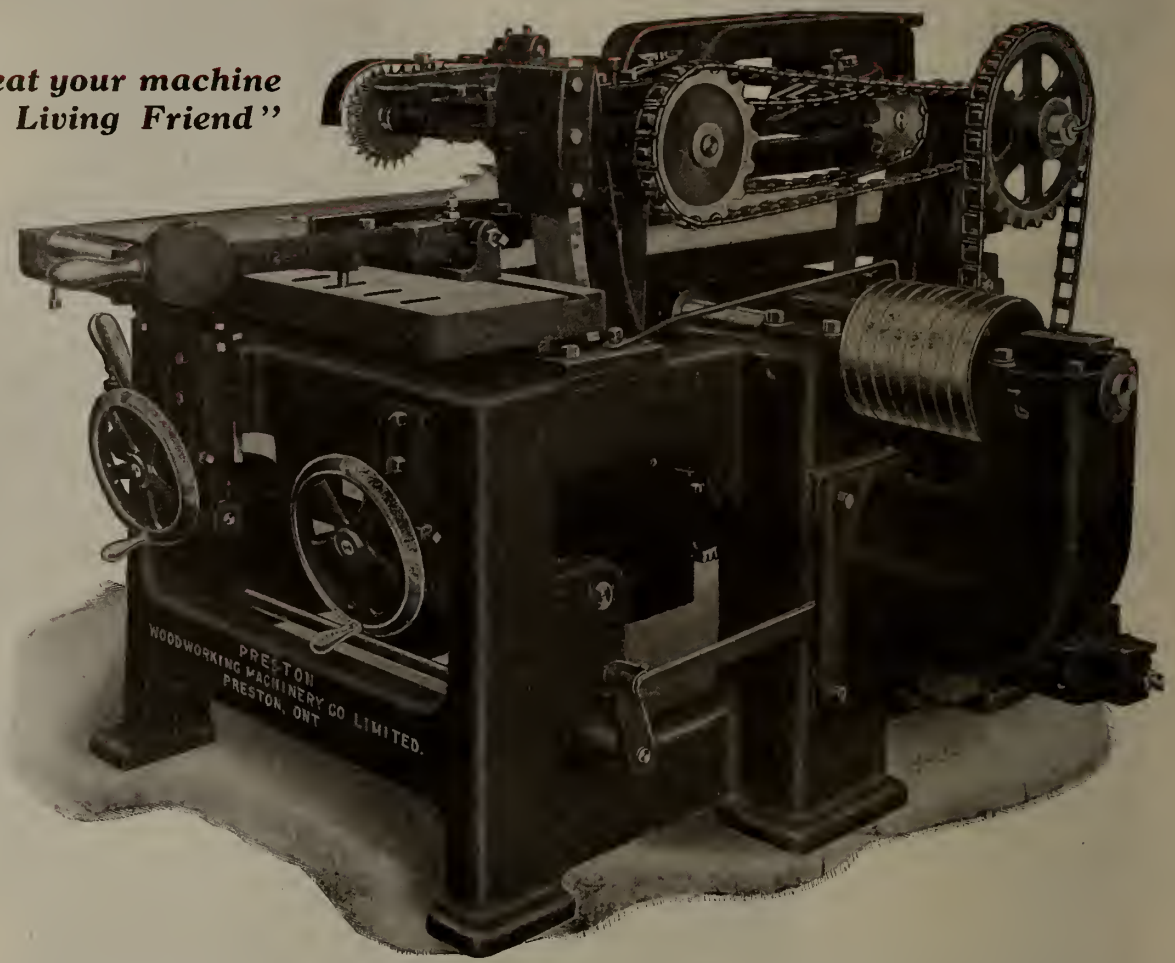
No. 129 "PRESTON" POWER FEED RIP SAW

"Treat your machine as a Living Friend"



Carefully made to give genuine service the PRESTON No. 129 Power Feed Rip Saw, with variable feed will increase production and cut down your labor costs.

The frame is one solid casting, each bearing is self oiling and both table and upper works are raised and lowered by hand wheels.

The PRESTON No. 129 Power Feed Rip Saw will merit your approval by its efficient service.

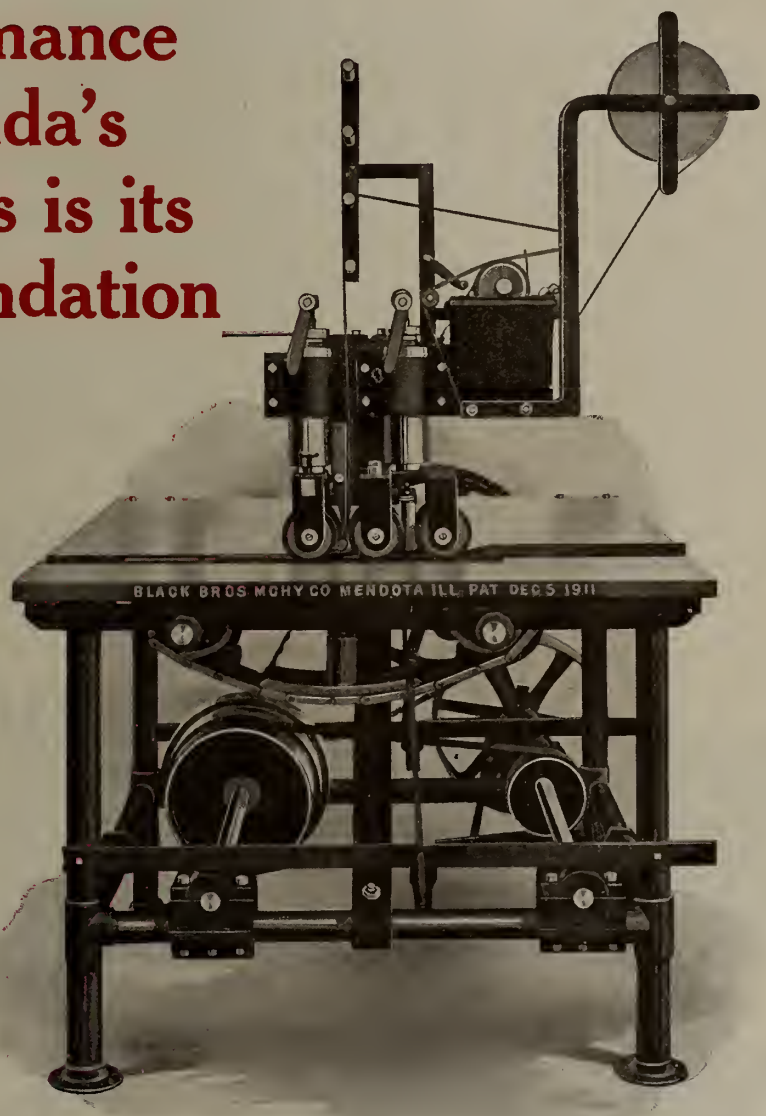
Our catalogue describes this and many other woodworking machines that are worthy of investigation every time you contemplate a new machine. You should have a copy of it. Let us send one.

The Preston Woodworking

PRESTON

Black Bros. Model
VENEER TAPING MACHINE

Its daily performance in many of Canada's Largest Factories is its best recommendation



The volume and quality of work performed by this leading veneer taping machine will positively reduce the operating costs in your veneer room. Not only will it turn out more work with less men but it will do it better. It is designed to apply tape already gummed or will apply the glue as the tape is used.

We know this machine will do all we claim for it and to show our confidence in it we will place one in your plant on trial. If it does the work you will want to keep it—if it doesn't we will take it back.

COWAN & COMPANY OF GALT, LIMITED, Galt, Canada

Canada's Chief Industrial Need

Canada's chief industrial need at present is not only increased production—but increased QUALITY in its increased production. It is vital not only in our domestic markets, but also in the world's markets overseas where need of goods has flung the gates open for a time but only QUALITY of goods can prop the gates open for all time.

To the manufacturer seeking to increase both the quality and quantity of production, S K F's foresight in organizing a scientific research for the study of bearing application and design is of value, we believe. For it enables the manufacturer to place his bearing problems in the hands of this technical staff with the assurance that a sincere attempt will be made to solve them.

This scientific, specialized engineering service is offered not only to those manufacturers who have already accepted the bearings produced by S K F as the highest type of anti-friction device, but to all others who recognize both the individual's and the nation's need of higher quality in our increased production.

Save 25% to 50% of Blade Upkeep and Power Cost

Get Two, Even Three Times As Much Work

It's not the blades that wear out that cost, it's those that break.

It's the broken blades that cut down productive time and cost to repair and to replace.

Blade breakage is reduced to a minimum on Fay-Egan No. 50—36" **Square Column "Lightning Line" Band Scroll Saws.**

The Fay-Egan "Knife Edge" Blade Tension, made on the principle of a fine laboratory balance scale, is so sensitive that it compensates for changes in atmospheric conditions—yet, so flexible, you can pass a block between blade and wheel, while running, without breaking the blade. Folks tell us blade expense on "No. 50" averages 50 to 75 per cent. less than on the old timers.

The solid lower wheel acts like the fly wheel on your engine, its momentum carrying the load, so that the power consumption is reduced fully one-half, while at the same time it controls the light-spoked upper one, preventing over-running and choking down on a heavy cut.

The heavy square column eliminates vibration and permits the wheels to be revolved at 50 to 100 per cent higher speed, increasing the cutting capacity to double, and in some cases, triple that of the ordinary band saw.

As a user of saws, you cannot afford to ignore what Fay-Egan Square Column Band Saws are doing for others and can do for you. An investigation does not obligate you.

LEADERSHIP

Leadership in any field is never gained without effort. Nor is it gained in a day. Rather it must be attained by hard consistent service—by giving one's customers just a little more, perhaps, than they expected. Always striving to do the thing that is right whatever the cost.
When we say that we are leaders in our field and that we offer you just the treatment that leadership has to offer—then this is no mere boast but a real "honest-to-goodness" wish that you will let us get acquainted. Will you?

QUALITY SERVICE

Boland Lumber Company
Murray Bldg., Grand Rapids, Mich.
Manufacturers and Wholesalers Northern and Southern Hardwoods

Northern Woods:
Ash, Basswood, Beech, Birch, Hard Maple, Quartered Maple, White Maple, Soft Maple, Soft Elm, Rock Elm.

Southern Woods:
Cherry, Chestnut, Cottonwood, Cypress, Gum, Hickory, Magnolia, Oak, Poplar, Sycamore, Walnut, Willow.

Please send us your inquiries and it will be a pleasure to quote you and describe our stocks

Band Mill and Yards, Memphis Plant.

YES

YES Cars are extremely scarce and the indications are this condition will exist for some time.

YES Freight rates on lumber are going to be increased materially.

YES Stocks of all kinds of hardwoods are badly broken and scarce.

YES It will be good judgment to get such stock as you are needing in transit promptly.

YES We operate two band mills on our own timber, and manufacture all the lumber we ship, which enables us to furnish stock of even grade, color and texture.

YES We will appreciate an opportunity of serving you and will be pleased to quote you at all times.

YES We are manufacturers of all kinds of high grade Southern hardwoods.

DIRECT FROM PRODUCER TO CONSUMER.

GAYOSO LUMBER COMPANY

P.O. Box 1097 MEMPHIS, TENNESSEE U.S.A.

Manufacturers of

Northern and Southern Hardwoods White Pine, Spruce and Hemlock

With special attention to **Oak, Chestnut, Poplar, Cherry, Walnut, Gum and Basswood.**

OUR MOTTO

REASONABLE PRICES—that you can afford to pay.
EFFICIENT SERVICE — that you have a right to expect
FAIR TREATMENT — that you can depend on getting

We would appreciate an opportunity of furnishing a portion of your lumber requirements.

Are You Prepared "To Ride the Crest" of the Steadily Rising Tide of RED GUM *Popularity?*

Manufacturers of Desirable Grades of Furniture, those who have their fingers on the pulse of public taste, are rapidly *increasing* their lines of good

RED GUM

"Slow beginners" (known as the ultra-conservatives)—those who follow public taste at a safe distance behind—are *also* using a most unaccustomed quantity of **Red Gum**.

*This is the final proof that "**Red Gum** has COME."*

HOW IS YOUR LINE? ARE YOU "TO BAT" or on the bench, "waiting"?

The appropriate grades of **Red Gum**, "America's Finest Cabinet Wood," for good furniture (and trim), for every sort of use, are READY for PROMPT DELIVERY—and at prevailing prices are "the wisest buy for wise buyers" in the whole list of high-class furniture woods today.

Up-to-date architects and "interior landscape artists" are waking up and "giving their clients what they want"—i. e., **Red Gum**. (*ARE YOU?*) IT WILL PAY YOU TO *RIDE THE TIDE.*

WRITE US FOR ANY INFORMATION YOU WANT. WE'LL GIVE IT TO YOU RIGHT.

ADDRESS: RED GUM DIVISION,

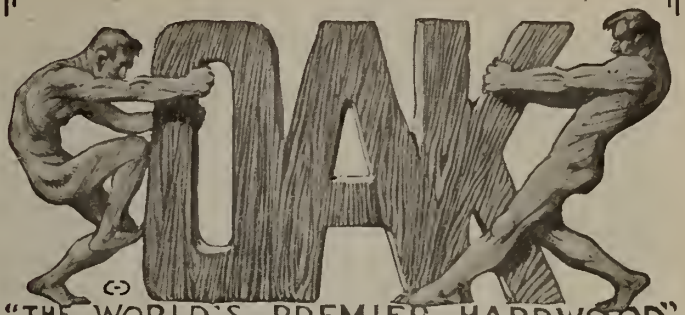
"YES!" IS THE WORD FOR AMERICAN OAK TODAY!



"THE WORLD'S PREMIER HARDWOOD"

to ALERT FURNITURE MAKERS: "A WHISPER IS ENOUGH"

From FILING CABINETS and other Office Furniture to "the bones of great ships"—OAK is **OAK.** (Supreme.)

From ***DELICATELY CARVED FURNITURE*** for the ***DILETTANTE TASTE*** to the sills and ribs of great structures whose nobility is in their sheer strength (and to the historic beams of Westminster Abbey) OAK is **OAK.** (Supreme.) ***GOOD*** **OAK FURNITURE is "COMING *IN.*"**

Without a rival, without an apology, without a substitute, OAK is indeed

"*The* WORLD'S PREMIER HARDWOOD"

(has been, is and ever shall be), AND EVERYBODY KNOWS IT.

Nature will never grow another wood as good as OAK for the uses for which it is historically appropriate.

No need to mention Economy—*you know it.*

AMERICAN OAK is PLENTIFUL, ECONOMICAL, INDISPENSABLE.

ADMIRE IT. TRUST IT. INSIST ON IT. ***SPECIFY*** *IT. USE IT.* WRITE us. TELL us. ASK us. *We will give you a Straight Personal Letter in prompt reply—WITH ALL THE FACTS.*

I O W A

BLACK WALNUT

No cabinet wood responds as fully to the art of the furniture designer or the skill of the workman as American Black Walnut. It meets every requirement.

Furniture of Walnut possesses a lasting charm and beauty that age does not destroy and the liberal use of this wood in furniture factories, guarantees the quality of their product.

Our customers assure us IOWA WALNUT is superior to all other varieties for its texture, grain and beautiful coloring. We can prove this by our first shipment.

Send us your list of Walnut requirements in lumber and veneers.

Des Moines Sawmill Co.
DES MOINES, IOWA

"Hartzell's Choice Walnut"

Are you a believer in the fact that

"Quality Counts"

Have you ever experienced that delightful sensation of accidently overhearing a person speaking in a complimentary way of the "Quality of your Product."

"We emphasize Quality"

If your finished product is made from Hartzell's American Walnut Lumber and Veneers you will have the last word in "Quality"

There is a difference and it will pay you to think it over.

Samples submitted and quotations made upon application.

Our Motto is
"Satisfied Customers."

WHEN IN NEED OF HARDWOOD LUMBER—WRITE TO

Wheeler-Timlin Lumber Co.

WAUSAU, WISCONSIN

Our new cut is now dry and we are particularly anxious to move a few cars of the following:—

1 "	No. 2 Common and Better Basswood.	2½"	No. 1 Common and Better Birch.
1½"	No. 2 Common and Better Basswood.	1 "	No. 2 Com. and Btr. Wisconsin Plain Red Oak.
1¼"	No. 2 Common and Better Basswood.	1½"	No. 1 Common Hard Maple.
2 "	No. 2 Common and Better Basswood.	2½"	No. 1 Common and Better Hard Maple.
2½"	No. 1 Common and Better Basswood.	3 "	No. 1 Common and Better Hard Maple.
1 "	No. 1 Common and Better Birch.	1½"	No. 2 Common and Better Soft Elm.
1½"	No. 1 Common and Better Birch.		

Good Grades, Prompt Service, give us an opportunity to serve you.

POPLAR

We offer for prompt shipment from Louisville, Ky., where cars are more plentiful and embargoes less stringent than at other points, the following:

5,000	5/8	1s and 2s
80,000	5/8	No. 1 Common
50,000	5/8	No. 2 Common
40,000	4/4	Saps and Selects
150,000	4/4	No. 1 Common
30,000	4/4	No. 2A Common
40,000	5/4	No. 1 Common
17,000	8/4	No. 2 Common A & B
250,000	4/4	Mill Run
16,000	5/4	Mill Run

This Poplar is Kentucky and Tennessee mountain stock. It's soft textured, shows good widths and lengths and is nicely graded.

An American Walnut Tree Selected For Our

LUMBER

PURCHASING AGENTS:—

Owing to embargoes and shipping delays, it is practically necessary for purchase orders to be placed thirty days earlier than in former years—we think this is especially advisable in Walnut today.

The years of experience of our buyers and the time and care used by them in selecting the raw material, for our output, terminates in the high character and quality of our lumber.

For Discriminating Buyers

TO produce any article of quality, good material with which to work and good workmanship are essential; so it is in producing Lumber of Quality.

By securing a Virgin Tract of Timber in the Sunflower River District of Mississippi, we laid the foundation to produce Lumber of Quality.

This Timber brought to our Modern Equipped Band Mill over our own Logging Road, sawn into Lumber and piled for seasoning on our well laid out Yards, properly graded and loaded, each operation under the direct supervision of experienced Operators—has Quality.

A Car will demonstrate to you this Fact.

Wake-up, Mr. Furniture Man!
Walnut is Plentiful!

AMERICAN WALNUT

"The Cabinet-wood Superlative"

Bureau Drawers That Slide

(and slide easily) after 200 years of service.

Try the drawers of an old piece of Walnut furniture—no matter how old, nor of what grade of workmanship. They slide easily—if they are Walnut. That is because Walnut doesn't shrink nor swell with the variations of temperature and humidity, and doesn't warp nor twist nor misbehave in any way—never a bit.

The supreme beauty of Walnut, in addition to the above qualities (and plus its "workability" and its "carvability"), accounts for the world-old supremacy of Walnut as a cabinet-wood—and its price permits its use in *every grade* of furniture that the careful buyer is likely to ever consider.

It will help you in your furniture buying to *know all about* American Walnut. (The furniture man will respect your discrimination, and you may be sure he will honestly give you what you want. He knows the facts—and is glad that you do.)

Don't fail to WRITE NOW for the WALNUT BOOK—edition de luxe—which will come by return mail with our compliments—and our confidence in your appreciation of it.

AMERICAN WALNUT MANUFACTURERS' ASSOCIATION

Room 1019, 616 S. Michigan Blvd., Chicago

ALL BRANCHES OF THE FURNITURE TRADE

are feeling strongly the Effects of the series of tributes to our American Walnut which are running continuously in most of the Best Publications in America. Above is an example.

There are still a few Furniture Houses in the Country

who are giving some of their better-posted competitors a great advantage over them with the Best Trade. WHY? Simply because they "heard somebody say" that American Walnut was getting scarce. Let them ask us for THE FACTS! (See address above.)

Amended Sales and Luxury Tax

Extended reference was made in the June "Canadian Woodworker" to the sales and luxury taxes. Since that issue was published amendments, which alter these taxes in their application to certain branches of the woodworking industry, have been incorporated in the budget.

Under the new changes furniture as described below, is subject to a tax of 15 per cent., this tax to be collected by the vendor, who in this case is the retailer, at the time of sale or delivery. All antique furniture of walnut, mahogany, rosewood, ebony, prima-vera or oak. Carved ebony or teakwood or lacquered furniture. All tables made specially for cards, checkers, chess and other games. All furniture finished in gold leaf, verni martin or with ornamental and expensive inlays such as mother of pearl or with handpainted decorations. All liquor cabinets, smoker cabinets, tea wagons, sewing cabinets, work tables, piano lamps or stands, table lamps or stands, ferneries, jardinieres, pedestals and bric-a-bac when made of rosewood, prima vera, solid mahogany or ebony or lacquered or decorated.

That means as far as the last-mentioned list of furniture is concerned the tax applies only when the pieces listed are made in the woods or finishes mentioned. The term "antique furniture" refers to the age of the piece and not to the period or design.

Musical instruments are taxes as follows: 5 per cent. on pianos not exceeding $450.00 in value and organs not exceeding $150.00. 15 per cent. on pianos exceeding $450.00 in value and on all organs over $150.00. 15 per cent. on mechanical player pianos, phonographs, music boxes and the necessary records. This tax is to be collected by the manufacturer at the time of the sale or delivery to the dealer.

Protection has been given the wholesaler and jobber by an additional 1 per cent. sales tax on sales made by the manufacturer direct to the retailer or consumer or on importations by the retailer or consumers. Thus a manufacturer, if selling another manufacturer, wholesaler or jobber must invoice and collect the 1 per cent. tax. On sales made by a manufacturer direct to a retailer or consumer, he must invoice and collect 2 per cent. sales tax.

A recent ruling of the authorities at Ottawa is to the effect that the department holds manufacturers responsible for the 2 per cent. sales tax on sales to concerns doing a wholesale and retail business unless the wholesale and retail branches are entirely segregated. A retailer is defined as a person, firm or corporation selling exclusively to the consumer.

Operators of planing mills or sash and door factories, whether conducted separately or in connection with some other business, are classed as "manufacturers," and must collect the sales tax on all sales. Contractors or sub-contractors are regarded as retailers and all sales by manufacturers to them must carry the 2 per cent. tax. If a contractor or sub-contractor manufactures some of his own material, such as sash, doors, mouldings, etc., he must charge and collect the 2 per cent. tax on the cost of such material. The planing mill or sash and door factories only collect 1 per cent. on sales to the wholesalers or jobbers.

Present no Time for Timidity

The present is not a time for a "ca' canny" attitude as far as lumber buying is concerned. True the lumber industry is in an unsettled condition and slight reductions have been made on certain stocks, yet it is probematical which way the market will go. Lumber stocks are still less than normal, with a large potential demand ahead. Should any part of this demand materialize, in the near future, values are bound to stiffen and perhaps increase.

Another point to bear in mind is that the lumber manufacturers, wholesale yards and wood users are carrying reduced stocks with a tendency to allow them to dwindle still further. Thus the woodworkers are working on a very narrow margin of safety. While the present may not be a good time to stock up to any extent yet all manufacturers should watch their lumber piles closely and see that they do not get too low in any particular line. The transportation situation and the proposed increase in freight rates should also be kept in mind.

With the majority of wood users operating with low stocks, there is the possibility that a considerable number may run short and come into the market about the same time. In that event there is chance that there may not be sufficient assortment to satisfy this demand. Several instances have occurred recently where manufacturers have run out of certain important items and have been forced to pay top notch prices to secure immediate delivery of the required material. This does not look like good management. Play safe by all means but play safe both ways.

The Design and Application of Panelling

Has Six Distinct Period Expressions—Wide Variety of Applications Possible—Oblong More Pleasing Than Square—May be Adapted to Any Class of Home

By W. H. Shaw

One of the most effective ways of relieving the uninteresting monotony of plain walls and ceilings is by panelling. Because of the structural character of the material and the natural beauty, whether carved or plain, panels are unusually attractive; they give the impression of permanence and stability which being in the walls themselves is transferred to the occupants —and what family objects to such implied virtues.

Panelling has practically always been in favor. Earliest architects have used it and each age has added traditions and insignia of the times. Though perhaps during the times between the late Georgian and early Victoria days the pleasing mode of interior decoration was temporarily forgotten, it soon again won favor—and why not?

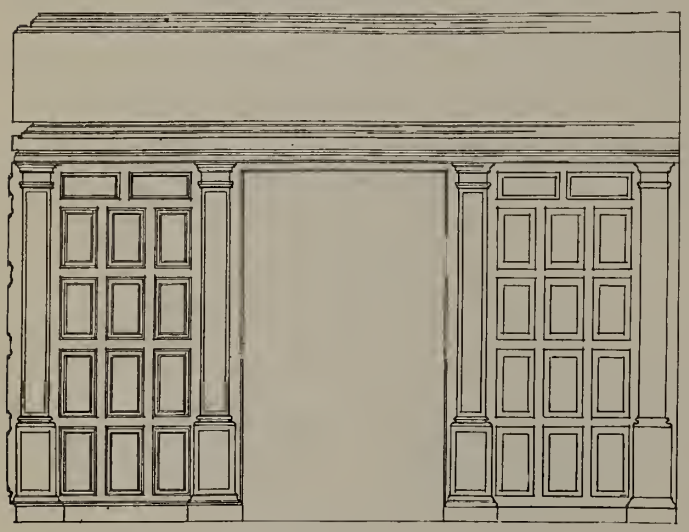

Fig. 1. The Elizabethan style of panel

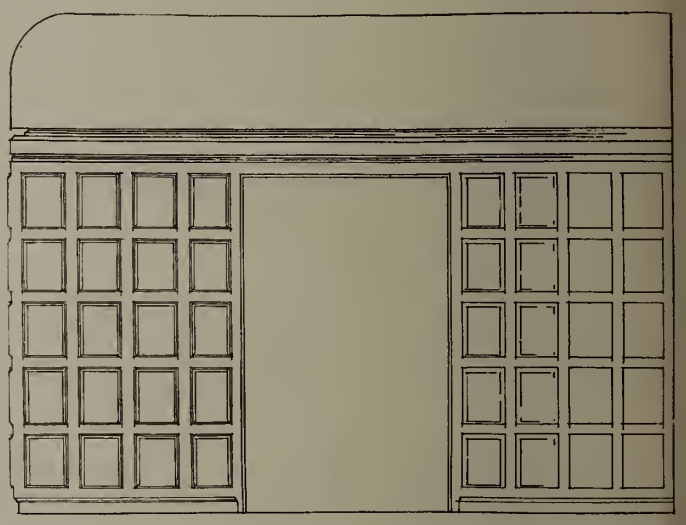

Fig. 2. Panelling from the Jacobean period

English panelling is generously divided into six period expressions: Elizabethan, Jacobean, William and Mary, Queen Anne, Georgian and Adam. The outlines and general features of each are pictured here, taking the problem of a doorway and its panels in each period.

Lend Size and Dignity to Rooms

Many will complain that panels seem to limit and bind the walls, giving the impression that the room is strapped or tied. It may be argued that as many ships make a harbor seem larger and as many trees against a sky make a horizon appear farther away, so panels, correctly used, give an impression of size and perspective to rooms properly treated. Such a treatment will beautify otherwise uninteresting walls. As soon as the room is panelled, becomes distinctive, and takes upon itself a certain individuality not possible with patterned decorations.

It is easy to make such rooms all different, no matter how large the house to be decorated. In the first place, in addition to the six styles of English panelling mentioned, many other styles of panelling are available. The possibilities are endless. Each room has its wall spaces and accordingly its opportunities. Each room has its outside and inside exposure, its relation to other parts of the house, and its place in the general decorative scheme of the entire house. Each room has its woodwork and its chief feature, a window, a mirror, or a cabinet. There is nothing monotonous about panelling if it is carried out correctly.

The Elizabethan Style

In detail 1 is shown the Elizabethan style. In this particular class of panelling, oak was generally used and the panels were small, being separated by broad stiles and rails. Not infrequently the top row of panels had a different shape and proportion from the others. In many instances the panelling ran only to the wainscot height with the plastered wall above. At the top of the panelling was often a carved or moulded frieze. The ceilings were either beamed or moulded in geometrical patterns. Door frames and pilasters were carved in low relief. Doorways and fireplaces were often objects of rich ornamentation, in the shape of pilasters, and at the top, elaborate carvings and mouldings. The window openings were usually large.

The Jacobean Period

The Jacobean, shown in the second sketch, followed the Elizabethan. It covered the years 1603 to 1688. It consisted of rows of small panels surmounted by cap mouldings. The feature of the detail is the bevel moulding at the bottom of the panel and the moulding of the side and top of panel stopping against the bevel section. In low studded rooms the panels were carried to the ceiling, but sometimes, as shown a cove surface connected the ceiling and wall freize into one, giving a low ceiling effect. In the freize and cap mouldings there was often some crude carving. While oak was principally used in this class of work, pine deal, Scotch fir and sometimes cedar were employed.

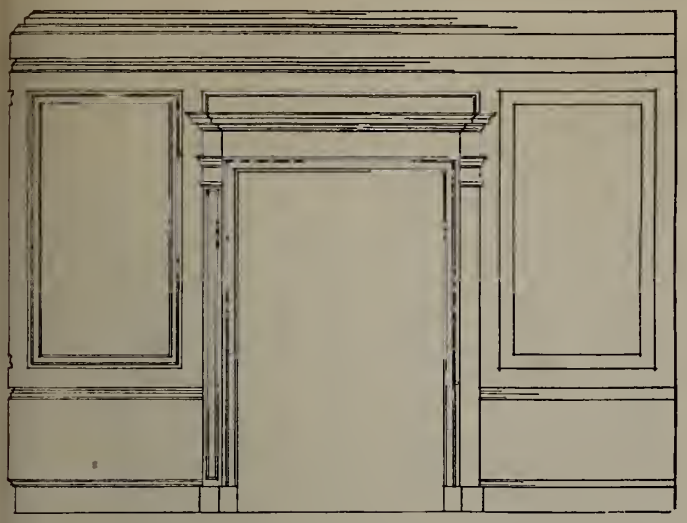

Fig. 3. Final development of Adam interior decoration

Fig. 4. Large panels and vigorous mouldings mark William and Mary design

The study of both the Elizabethan and Jacobean styles brings up the question of the shape of the panels. Builders and millmen should remember that, for some psychological reason, square panels are not pleasing. The oblong, on the other hand, is always restful and make possible all sorts of combinations of lines. The oblong combined with the square, also gives remarkable opportunities. It might be suggested in this connection that when it becomes desirable to make three panels of equal size and shape, the centre one should be in reality a little larger if possible, otherwise it may look smaller. This rule, however, applies primarily when particularly wide styles are used and when the room is large enough to be received at long perspective.

Adam Style Made Deep Impression

The third design created by R. & J. Adams produced a deep impression on English interior decoration. It might be said to be the final development. The proportions of the panelling, the details of the moulding and carved ornaments are always refined. Among the distinguishing features is the elimination of wood wainscot and styles. The wood moulding was applied directly to the plaster, no panels were shown below the chair rail. Although seemingly wide, mouldings are low in relief and consequently do not appear heavy. The door surroundings take various forms, always markedly architectural in character.

The William and Mary style, 4, is generally classed as the third in the development of English panelling. It is a simple arrangement of one large panel above a low wainscot. The feature of the detail is the fact that the moulding forming the panel is so shaped that the line of the panel is considerably in front of the line of the stile. The main emphasis of this period is placed on large panels, mouldings of bold vigorous profile, and rich carvings. The architectural influence of the walls on furniture design began to be pronounced in the William and Mary contours. This relation between architecture and furniture is a real basis for successful decoration. Designs even so simple as William and Mary are better for being placed against walls of their own period.

Introduction of Painted Panels

Carved and panelled woodwork was a highly important item in the decoration of early Georgian rooms, illustration five. This fifth stage in English panel development witnessed the passing of oak and the substitution of painted pine and deal. The colors used were white, grey, grey green, and sometimes blue, brown or yellow. The general proportions are bold, and the details of the mouldings, while bold are simple. A moulded chair rail often separates the base panels from the upper panelling. The door surroundings were frequently graced by superimposed pediments,

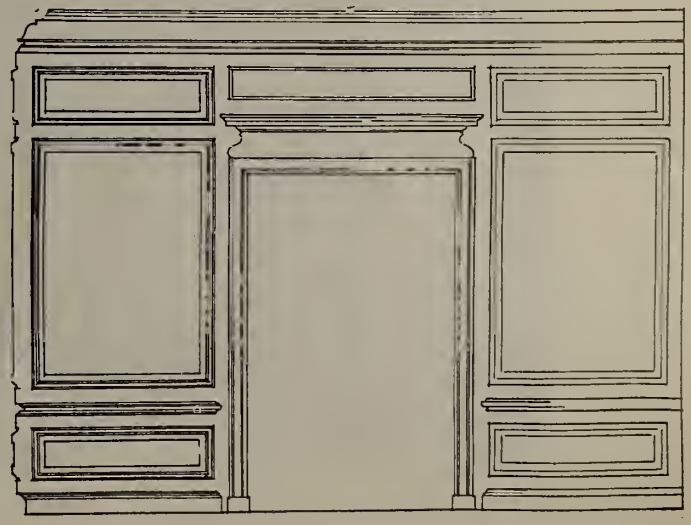

Fig. 6. This design was popular during the Queen Anne period.

Economical Features in Home Construction

Planning to Eliminate Unnecessary Expenditures Practical Necessity—Saving Effected Without Sacrificing Comfort, Convenience or Appearance —Suggestions that Tend to Lower Costs

One hears many statements to the effect that building costs have reached their peak and that lower costs are imminent. In spite of all that has been said and the various predictions made, the values of building material seem to rise from week to week and construction costs keep pace. Regardless of the large amount of money involved, the shortage of homes and the increasingly high rents have, perhaps, not forced, but, at least, made it advisable that many people undertake the construction of their own homes. Thus building goes on apace much to the dismay of those who have adopted the watchful waiting attitude.

The present high costs have had one beneficial effect, namely, that of forcing the prospective home-builder to practice economy and scrutinize every item and detail of his new house. Thus, this might be termed an era of sane building, as most of the homes that are going up today are simple, yet attractive and designed to provide both comfort and convenience.

The accompanying illustrations were taken from a plan sheet prepared by the Long-Bell Lumber Co., of Kansis City, Mo. The plan is of a cosy, five-roomed bungalow, that, while designed for economical construction, embodies many inexpensive touches that add to its simple beauty and give it an air of cosy hominess. The layout is such that practically all waste space is eliminated. The screened-in porch, which is so desirable during the warm summer evenings, opens into an attractive living room provided with a cheery fireplace. The dining room is well lighted and a built-in buffet lends an air of convenience, as well as adding to the appearance of the room.

A window provides an abundance of light in the pantry so that all the mixing and preparing of food may be done at the built-in cupboard, where everything would be handy. The large closet off the kitchen provides ample storage room for linens, bedding, etc., and should save many steps in the course of a week or month. The screened porch at the back would make a very cheerful breakfast alcove or even dining room during the warm weather. Ample closet room is provided for in both bedrooms. It is good to see a house with so many windows as there is nothing like an abundance of light and fresh air. It is difficult to be blue or discontented when the surroundings are bright and cheerful.

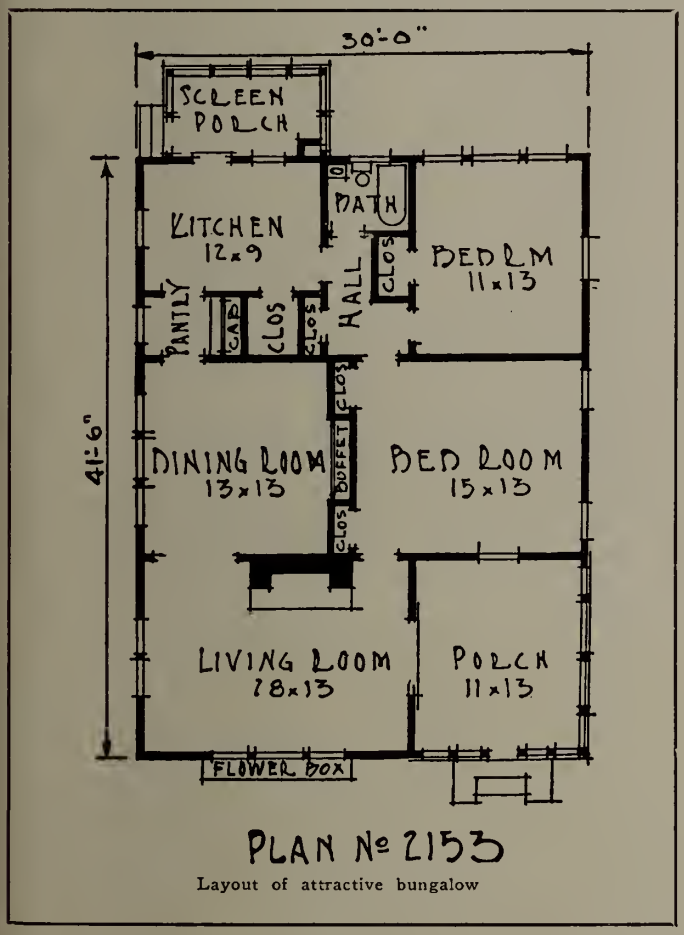
If one were building a more pretentious residence in all probability an architect or other expert would be consulted. The design and construction of the smaller dwelling embodies problems all its own as it

An attractive inexpensive home

is the problems of the large house intensified. One must provide the same living conditions in a more restricted area. The room sizes should have careful consideration and be worked out so that stock lengths of joists may be employed without further cutting. A twelve-foot joist, allowing for a bearing at each end, will give a room eleven feet two inches wide.

For the ordinary sized home a two by ten or two by twelve joist is sufficient provided it is bridged. The bridging consists of pieces of wood nailed diagonally between the joists, at least once in every span, to stiffen them. The depth of the joists whether 8 in., 10 in., 12 in. or 14 in., depends on the length of the span and the stock available.

Combining the outside and inside basement stairs is a very economical and convenient arrangement. This is usually effected from a grade entrance by having a few steps leading down from the kitchen. When this form of construction is possible it saves the expense of one set of stairs.



PLAN Nº 2153

Layout of attractive bungalow

As far as possible special designs in mouldings and interior trim should be avoided as a considerable saving can be effected by using stock designs. The same applies to special details of construction, stock doors, sash and frames all tend for economical construction. When special work is called for, the bill is sure to be high for it is costly to set machines up for short runs. In addition, a long wait may ensue while the special features are being made.

A number of inexpensive variations may be embodied in trimming the interior. As a rule ,a wide choice of stock designs of trim are available. Excellent effects are often secured by using plain trim with square head instead of miters and the expense of making the miters eliminated.

The designing and planning of a home has resolved itself into a case of using the head to save the pocket book, and it is surprising the unnecessary expenditure that may be avoided by a little thoughtful planning.

Application and Design of Panelling

(Continued from page 49)

either straight or interrupted by a central urn or bust, the same motive often being echoed in the chimney piece. Base, surface, panels and cornice were often enriched with ornaments.

The Queen Anne, detail 6, a small panel is placed above the large panel, about the same size as the small one in the wainscot. The detail of the mouldings is soft and round, with a raised member in the centre of each moulding. The carvings were rich, as in the William and Mary times, the doorway and mantlepieces receiving the especial enrichment of carved and moulded ornamentation.

Feature of Any Home

As mentioned before many other styles of panelling are at ones disposal, and today what was once possible only for the rich, can now be secured in the homes of the blessed middle class. Even with papered walls, "stripping" or latticing to obtain panels is a steadily growing practice and more or less elaborate decorative strips or styles are used.

In panelling, the panel is the thing and the style or strip which makes the panelling is suborinate to it. Therefore, a wall simply cut in two is not advisable, as it makes the stile the figure. Stiles should on the whole, be broad. The broad panel strip, lattice, or batten is desirable because it gives not only the suggestion of richness but of permanence and adds to the impression that the panels have been especially prepared for and built into the wall. Panel strips may be enamelled or stained to harmonize with the general treatment of the room and with its woodwork, but, however, finished, they should offer substantial lines, particularly if the contrast in color between the panel and strips is striking. A dark wall panelled with narrow white stiles, or light walls panelled with narrow dark stiles, are not pleasing. However, if both the stiles and panel are of similar tones the narrow stile may be permitted. Narrow strips may be used with narrow panels.

Panelling, in the modern sense, has very practical reason for being. It is not only logical and therefore, beautiful but it offers certain indisputable advantages, it is easy to decorate, it is wholesome, durable and permanent, and most of all, suited to the strain of wear and time.

Catalogs and Publications

Saw Fitting is the name of a small booklet recently issued by Wm. B. Mershon & Co., Saginaw, Mich. In addition to describing some of the saw fitting tools manufactured by the Mershon Co., practical suggestions are given on the care and upkeep of band resaw blades. A copy may be had on application to the above mentioned firm.

The Canadian Blower & Forge Co., Limited, Kitchener. Ont., have issued a Catalog describing their system of factory ventilation. This system is adapted, primarily, to removing the excess moisture and fog which is found in dyehouses and bleacheries. The system can be applied to any plant that is troubled with heavy moisture condensation in any department.

Spreading Gospel of Better Furnished Homes

Increasing the Demand for Quality Furniture—Educational Scheme on Comprehensive Scale—Will Manufacturers Adopt New Sales Policy?

By R. W. Wells

The scheme of maintaining and enlarging the market for their products through a broad, far-reaching publicity campaign and closer co-operation with the retailer, as adopted by the furniture manufacturers, through the Furniture Manufacturers' Association, is a progressive, commendable move, and one that should have far-reaching, beneficial results. Under the new order of things, when the education campaign is in full swing, the representatives of the manufacturers will cease to be salesmen and order takers and will rise to the status of missionaries or ambassadors of better-furnished homes.

The new duties of a furniture salesman will be to sell the retail dealer the idea of warm, cosy living rooms, stately, dignified dining rooms and tastily furnished homes rather than dispose of individual pieces of furniture. He should also know how his goods are manufactured, the different operations performed, the various woods and finishes employed, the details of the different styles which are so popular and which are so instrumental in raising the status of the furnished home. Armed with this information, the salesman will be able to instruct the retailer as to the fine points of the different pieces, point out the details of their construction, style and finish, and instruct him as to the different woods so that he will be able to talk intelligently on them and distinguish the genuine from the imitation.

Considerable misunderstanding exists in the minds of the retail furniture dealer, his employees and the buying public as to the value and merits of veneered stock. Many think that veneering is resorted to, to cheapen the construction of furniture and that it is far inferior to solid material. This is not so and it should devolve upon the representative of the furniture manufacturer to combat this false impression. If he knows the different operations performed in making veneered stock, together with the arguments and facts in favor of veneered or built-up material, he should be able to convince the dealer that a veneered article is better than one made of solid wood, that it is stronger, lighter (less freight) and more lasting. When veneered work fails it means that the article was not handled properly, that it was exposed to dampness or moisture or that the manufacturer did not do his part as carefully and thoroughly as he should have done. When the dealer is convinced of these facts he will be able to talk convincingly on veneered furniture and help overcome the prejudice which exists against this line of furniture. Armed with this knowledge he will know good veneered work from bad, with the result that veneered furniture will not be condemned because of faulty workmanship and the quality of veneered furniture put on the market will necessarily be raised.

Perhaps a change in selling methods will take place. Instead of arming his representatives with blocked-out photos, showing individual pieces of furniture, the manufacturer will provide the salesman with handsome photographs of attractively furnished interiors, in which each suite and each individual piece is displayer to the very best advantage. Such photos should enable the buyer to visualize the furniture in the home. This is a very important step in the campaign for tastily furnished homes.

The same suggestion could be carried out in all catalog work, retail and newspaper advertising. If followed, it should lead to larger orders being placed and the market for furniture being extended. The tendency, both on the part of the furniture buyer and on the part of the buying public, would be to purchase the complete suite or even all the furniture shown in the picture, instead of picking out and ordering the individual pieces.

This is salesmanship of a high order and is what is needed to put furniture and attractively-furnished homes across in a big way. Every one in the chain of distribution, the manufacturer, his representative, the retailer and his sales force and the ultimate buyer must be able to visualize the furniture in the home. Talk, no matter how convincing, cannot bring this about to as good advantage as attractive illustrations.

Educating and selling the idea to the traveller on a comprehensive scale falls upon the furniture manufacturer, either as an individual or working together in groups or as a whole. It is not too early to start this course of training. The campaign will soon be under way and the salesmen should be in a position to jump in and put their shoulder to the wheel and boost and talk the idea for all they are worth. The salesman is the representative of the manufacturer. It is he who gives the personal touch and makes the personal contact between the manufacturer and dealer. Therefore his attitude and his enthusiasm or lack of enthusiasm can do a lot to increase or nullify the value of the publicity campaign which is to be carried on through trade journals, newspapers, and by the aid of attractive circulars and dealers' advertising service.

The scheme is a comprehensive one and must be carried out in a large way if the furniture industry is to reap the fullest benefits from the efforts expended.

Manufacturing Hockey Sticks

The Hespeler Wood Specialty Co., Limited, Hespeler, Ont., who were recently incorporated to manufacture and deal in hockey sticks, bent wood and specialties, have a very complete plant. It is the intention of this firm to specialize in a high-grade line of hockey sticks, and with the equipment installed, they are in a position to produce these at the rate of from 75 to 100 dozen per day. The machines installed include a C.M.C. power feed rip saw, Cowan rip saw, 36 in. C.M.C. band saw, 30 in. Cowan band saw, Cowan buzz planer, 24 in. surface planer, and the necessary steam retorts, benders, sandpapering wheels and other small equipment. Power is derived from a 100 horse power engine. The plant is heated by a fine heating system. An up-to-date dry kiln is also operated in connection.

Quantity Production Applied to Chairs

Parts Standardized to Increase Output—Electric Stacker Assists in Yard—Parts Sent to Finished Stock Room—Contract Piece Work Basis Used

By Lloyd P. Robinson

It is a far cry from Thomas Chippendale. cabinet maker par excellence, laboriously turning out chairs with knife, chisel and hand lathe, to Heywood Brothers & Wakefield Company, with their great factory in Chicago, embracing 620,000 feet of floor space and producing approximately 600,000 chairs annually, largely by the swift processes of machinery. Two centuries of amazing electrical and mechanical development, together with industrial organization experience, lie between the two. In this plant one discovers a perfect development of the modern American system of quantity production by standardization of patterns and minute division of labor, which Henry Ford first made famous. This standardization method effects a remarkable economy in the production of chairs. About 1,000 men some 200 women and girls are employed at the Chicago plant, and these workers produce 600,000 chairs, besides a tremendous quantity of rattan furniture, baby carriages, sun parlor and breakfast room tables each year.

Let us start with the lumber on the sticks in the chair factory's yard. In this yard, which covers approximately 136,000 square feet, one will see piled in soldierly lanes, 6,000,000 to 7,000,000 feet of hardwood lumber, about a year's supply. Most of these piles will be found to tower upward 45 feet. Here and there about the yard men are discovered erecting new piles of lumber to take the place of those that are continually being torn down to go into the dry kilns. The builders of these piles are aided by an electrically operated stacker, which stands by the growing pile and raises the boards up one by one on a continuous belt to the men doing the laying out on the top of the pile.

Many Woods Used

The stock in the piles consists chiefly of No. 1 common stock in quartered and plain oak, plain and quartered red gum, maple, birch, soft and rock elm. with a comparatively small quantity of mahogany. It will be noticed that no FAS stock is mentioned. This is because virtually none of the cuttings required in the factory must be over 40 inches and plenty of clear stock of these lengths can be secured out of No. 1 or No. 2 common grade stuff. The longest cuttings which the plant requires are for the making of table tops.

A great deal more birch will be used this year than last, because the plant is turning out better quality chairs than formerly. Considerable more red gum will also be used, as it has been found that this takes a walnut stain, and matches up with walnut parts in the construction of walnut-stained chairs, much better than birch or maple. The birch serves best in the making of mahogany-stained chairs.

Abutting the yard is a long building housing 20 dry kilns, each with a capacity of from 12,000 to 15,000 feet of lumber, depending upon the size of the stock. Fifteen of the kilns represent the cold water condensing system and five of them the natural draft system. These kilns generally have around 200,000 feet of lumber drying in them all the time, the stock remaining in the kilns on an average of 20 days. When this drying has been effected the stock is ready to pass into the great factory building across the street.

Stock Cutter of Added Importance

The lumber goes first to the stock cutting room. In this department we find that the stock cutter has advanced in importance in the economics of chair making during the still present era of extraordinary hardwood lumber prices. He has a chance, by taking the trouble to exercise the gray substance in his cranium, to save much of the high-priced lumber that, under easier conditions, might be wasted. There are many ways in which a thoughtful cutter can save stock by taking a moment's time to figure the best way to take out a defect, but a "butcher" or "slasher" can waste a great deal of stock by just cutting ahead aimlessly along the board, according to the specified lengths. The extra time a stock cutter will have to take to estimate the most economical way to cut a particular board is worth while, for his time is not as costly as the lumber.

In the factory the saws, lathes, horses, planers, joiners and other tools are all driven by electricity, and there are even electrical sanding machines. Each department or group of machines and men has its particuar duty to perform in the building up of the finished product. One department may make the legs of a chair, another the seat, another the splats, another the arms and so on.

Each department gets the pattern of the part which it is to make and concentrates on that part. When its order for so many chair legs, or seats, or arms, as the case may be, has been filled, the finished stock is sent into the stock room, where the stock keeper records the receipt of the stock in his books. Finally, when each department has delivered over its part and all the parts of a chair are in the stock room, the stock keeper reports to the foreman of the assembling department and the latter takes out the stock and assembles the chairs.

Patterns Worked Out by Hand

The patterns originate in the office of the designer. He turns his designs over to the sample-making department, which consists of a few very high-class and skillful cabinet makers, who turn out the sample articles by hand, very much after the method of the ancient cabinet makers. It is from the sample hand creations of these men that the molds for the bending and the turning knives, etc., are set for the quantity production by machinery in the specialized departments.

The company has worked out a very satisfactory method for maintaining efficiency and keeping the production effort of its workers up to the proper pitch. Virtually all of the work is piece work, by contract. The foreman over each department or group of machines is given the contract to turn out a certain number of pieces at a specified price. He, in turn, pays the men who work under him. He himself works at a machine like his men do and receives pay for the pieces he produces. But in addition to this he receives what profit he can make out of the journey-

men under him. And you can bet there is no loafing on the job with this incentive to stimulate the foreman to rapid production. He sees that each worker does an honest day's work, for he knows that if the man doesn't he will be losing money.

Attitude of Workmen

An interesting sidelight on the operation of the factory was found in the department where dimensions of oak were being bent into chair rockers. Ordinarily the benders would take only two bendings, or four pieces out of the steaming retort at a time, but this workman was taking out eight, enough for four bendings. As a consequence he increased the risk of breaking the last two bendings, for before he could get to them they would begin to cool and dry. Before the critical scarcity of labor developed a bender would not have dared do this while an official of the plant was looking at him, but now he felt more sure of his job because it was hard to fill. Consequently, in order to save the time it would take to open the retort a second time, and increase the quantity of his own production, he took a chance on wasting his employer's stock.

All of the bending is done in molds, some of which are worked by hand and others by machinery. The lighter pieces, such as the parts for the bent wood Vienna chairs, can be bent in the hand molds. But curving chair backs, rockers and other heavy pieces, must be done with machinery. The moulds enclosing the bent pieces are put into drying apparatus and subjected to sufficient heat to dry them in 20 minutes to a half hour. When the stock has dried the molds can be taken off and the bend will remain permanently.

There is one department in the plant, however, where nearly 100 per cent. hand work is required to turn out the product. This is in the rattan furniture department. The weaving of the rattan chair, couches, tables, pedestal lamps, baby carriages and other articles must all be done by hand. Only the wood frames upon which the long strips of reed are woven are machine turned and machine bent. The rockers, of course, are cut out by machine and bent into molds by machinery.

A great deal of interest is taken in welfare work for the employees, and about two weeks ago installed a cafeteria, which is already proving its value. An employee can get a well-cooked, wholesome and savory lunch for from 25 to 35 cents. A wide variety of foods is offered each day and the cost of each is reduced to a minimum, no effort being made to make a profit. It is needless to say that all the food is first-class. The coffee costs but 5 cents a cup and two slices of bread with butter go free with each order.

The plant has its share of labor troubles, but in general there is a great deal of good fellowship between the workers of the more intelligent kind and the officials.—Hardwood Record.

Suggestions for Increasing Your Profits

Reducing Power and Heating Account—Keeping the Bench Hands Producing—Importance of Veneer Room Not Realized—Cutting Insurance Rates

By Furniture Manufacturer

Before continuing our walk through your machine room, which we commenced last month, we will, with your permission, take a look at your power plant.

Your engine is, of course, an up-to-date automatic cut-off engine, and I see that you have a system for using the exhaust steam for heating purposes. That vacuum pump has paid for itself many times, no doubt as it has enabled you, you say, to dry all your lumber and heat your factory in winter with exhaust steam from the engine. Some factories are now accomplishing the same thing without a vacuum pump and with an injector, but personally I have never had any experience with it and cannot say if it is an improvement on the Webster system, but will only say that if it is, it must be good.

Electric Motor to Reduce Power Bill

Have you ever tried using a motor, run by hydro-electric power for part of your equipment such as your shaving exhaust fan. Where there is a heavy machine taking a lot of power continuously such as a fan which runs whenever the plant is in operation, a motor is an economical way of furnishing power to it, and if you are so situated that you can count on a continuous supply of electric power, at reasonable rates, you should certainly look into the question of the comparative cost of steam and electric power on your fan or any other machines taking a steady supply of power to keep them in operation.

You say that you have a good deal of trouble with scale on your boilers. Why not put on skimmers that if blown off every hour or so, help to remove a great deal of the impurities from the water, and for some waters are invaluable in preventing scale. Perhaps also your compound is not suited to the water. It might pay you to have your feed-water analyzed and their experiment with different compounds until you get one that is suitable. Finally a regular inspection by the "boss" himself will sometimes nip this trouble in the bud,—which is the best place to nip it—and if it does you will be well repaid for your trouble, both in the saving of fuel and in prolonging the life of the boilers.

And now, after this cursory look through your power plant, let us take a look at a few of the machines on the second floor. The ordinary trim saws we will walk past and the square chisel mortiser, which we spoke about last month. The triple-drum sander is a good one, I used to have one of the same make and its capacity was phenomenal on rough work. As regards your belt sanders, you have several and no doubt they are well adapted to the work you have for them. When it comes to large flat surface work, such as veneered tops, there is, in my opinion, only one make of belt sander to be considered. We cannot mention manufacturers names here, but for flat surface work your belt sander should have a sliding shoe, the length of stroke of which can be regulated as well as the amount of pressure. It is so superior to anything else I have ever seen, that it is, in my opinion, the most economical and most essential piece of equipment in a woodworking factory making any large flat surfaces.

Let us take a quick glance through your cabinet-room. I notice that each bench hand has a good

light, a good bench and a glue pot with heating attachment at his bench. They seem to have plenty of room to pile their jobs behind them as they are made. Very Good. I Presume that "odd" man walking about among them, is there to wait on them and keep them supplied with material. I was in a shop recently, where each cabinet maker had to go and hunt his own material, and also had to carry a lot of his own work to a drum sander in the centre of the floor. The consequence was that there was a great waste of time. The proper place for a skilled bench hand is at the bench, and if an "odd man" of the necessary intelligence can be made to wait on, say, 6 or 8 cabinet makers and do their odd work for them, enabling them to keep at the more highly skilled part of the work, his wages should be well repaid to the employer. If you are not doing this, give it your consideration.

And now for your veneer room. There is so much to be said here that it might fill this whole issue of the "Canadian Woodworker" I shall skim over it by saying that in a shop the size of this, where you employ, as I see, 6 veneer men at least, you should have a machine for trimming the edges, another for taping You should have a good hydraulic press, use vegetable glue, and have a good spreader. Finally, and more important than all the rest put together, you must have a good headman in your veneer room, one who can match veneer well and who is careful and thorough in all details. Veneering is a business by itself and while there are many pitfalls for the unwary, you will, judging from my experience, get more satisfaction in making all your built-up stock in your own factory, if you are properly equipped and have a reliable veneer foreman, than you could possibly do by depending on some outside source of supply.

Veneer Room Most Important

Perhaps the above remarks are too "general" in character for you to get much benefit from them, but I believe there is no part of your factory which would better repay your careful thought and investigation, if you are trying to get along with anything but the best equipment.

And now your finishing room. I see at the first glance that you have three drying compartments, one for fillers and two for varnish. Quite right, these are indispensable now-a-days, and will save from a week to ten days at least in getting the goods through this room, and besides will do better work than the old fashioned method of "wait and see." You are putting your varnish on with a sprayer, of course. Those small rubbing machines, run by compressed air, are great labor savers. But, there is one machine that I do not see and which is of the greatest value for large flat surfaces, and that is the large "stroke rubbing machine" made by the same firm, by the way, that makes the stroke belt sander, referred to above. This machine, the "stroke rubber" as we will call it, will do more work than three of the small compressed-air rubbers on large surfaces, and if you have enough work for it you simply must get one at any cost. If you could save two rubbers you can easily figure what you could afford to pay for it, and it won't cost you a quarter of that.

By the way, I am surprised to see that your factory is not equipped with a sprinkler system. Is not this a pennywise policy? A few years ago, I equipped a factory with a sprinkler system and it paid over 12 per cent. on the investment in saving in insurance premiums alone, besides the added protection. Prices, of course, are very different now and insurance has not gone up in anything like the same proportion as piping, etc., but look into it and ask yourself if you can afford to pay 2½ per cent. premiums instead of .30 per cent. for your insurance.

I had intended to say something about your packing room, and your system of inspection and shipping, but you are probably tired of me by this time and as I don't want to be kicked out, I will go out, and if you are kind enough to grant permission may call again next month.

Not Much Room for Pessimism

The Royal Bank of Canada in their monthly business letter outline the recent decline in prices, and the prospect of lower prices as follows: The distinctive feature of the last two months has been the retail sales at reduced prices which have taken place through the United States and sections of this country. They have been given great publicity, with the probable net result of leaving in the minds of many people an exaggerated idea of their importance. The governing influence in the decline was the shortage of credit and this must continue to be an extremely important factor. It seems probable that continued restriction of credit will present a barrier to the wild upward movements of prices which have characterized the period since armistice, but belief in a permanently lower level in the near future is hard to justify. Declining prices in a world where almost every important article is in scant supply seem impossible. How long the shortage will continue is beyond prophesy. Unless labor conditions become more settled it will take some time to remedy. Production has seldom been so slow and expensive as it is at this moment in many industries. Strikes and lowered efficiency of labor, difficulty and delay in obtaining raw materials, all contribute to heavy costs of operation, and at the same time retard production. Even were the present effective demand filled, there would still be, in the stricken countries of Europe, an enormous potential demand, which may make itself felt on the market from time to time during the next few years, and in so doing give a fresh spin to the wheels of commerce all over the world.

The Matter With Canada

Too many diamonds, not enough alarm clocks.

Too many silk skirts, not enough blue flannel ones.

Too many pointed-toed shoes and not enough square-toed ones.

Too many serge suits and not enough overalls.

Too much decollete and not enough aprons.

Too many satin upholstered limousines and not enough cows.

Too many consumers and not enough producers.

Too much oil stock and not enough saving accounts.

Too much envy of the results of hard work and too little desire to emulate.

Too many desiring short cuts to wealth and too few willing to pay the price.

Too much of the spirit of "get while the getting is good," and not enough of the old-fashioned Christianity.

Too much discontent that vents itself in mere complaining and too little real effort to remedy conditions.

Too much class consciousness and too little common democracy and love of humanity.

Good example of mill construction. Type of building best adapted for furniture and woodworking plants

A Better Way to Build Your New Plant

Modern Industrial Buildings Planned with Definite Aim in View—Due Consideration to All Governing Factors—Efficient Design Reduces Costs and Increases Production

By Frank D. Chase*

The old-fashioned factory was often a shed of wood or brick, located without particular reference to anything—except perhaps the personal pleasure of some official of the company, or with the sold aim of serving a local market. The development of the modern industrial plant is a scientific process. It begins with the analysis of the entire problem and discusses a great many vital features before actual building operations begin. The old order of things has passed away, and industry today is at the threshold of a new era of world commerce and world competition, as well as keener competition for domestic trade developed by the urgent demands made upon her by the war. The plant which is not designed and operated to meet these changed conditions, is going to have a hard time to survive.

The labor situation is a difficult one and will continue so for many years. This means that labor economies must be provided for. Many a manufacturer is today facing the necessity of abandoning a plant which produces excellent goods, simply because of excessive labor costs. In many instances these men recognize the conditions and are already taking steps to perpetuate their business by securing a plant which will permit operating economies.

The average manufacturer is glad to scrap any amount of equipment if it can be proven that the investment in new equipment will be a good one, i.e., reduce labor costs and increase output. There is no investment a manufacturer can make today which will so reduce costs and increase output as the investment for an efficient plant, and the modern manufacturer appreciates this fully.

Most manufacturers can recall, through personal experience or observation, plants which have been built without a definite plan to attain operating efficiency. The operating results obtained in such plants do not compare favorably with those plants where the essential factors of location, design, construction and operation are pre-determined by careful study and logical analysis. The modern manufacturer must perforce, to a greater and greater degree, apply to his problem an analysis of these factors; and furthermore no longer rely on his own judgment, but retain for his assistance an industrial engineer, who by reasons of his experience and opportunity for wide observation of the best practice in the industrial field, covering a variety of expedients for economy, brings to bear upon the manufacturer's problems the practical viewpoint which develops the best plant to meet existing conditions. This service might be likened to that of an attorney retained by a client to advise him before taking steps in business ventures which have a legal status.

The development of a modern plant involves two primary elements; namely, organization and plant. Organization includes financing, the organization of executive, operating, purchasing, sales and other departments, in other words, the building of a human machine. This article treats only of the plant, or the physical machine, and although the two are closely related, and in most instances must be worked out simultaneously, our discussion will be confined to the latter.

Choosing the Location

Plant location is the first consideration. This location must be determined with reference to the following. Raw materials, transportation, fuel water and power, labor, market. A proper location means the geographical location, i.e., the proper province and city or town which best provides these requirements,

*Frank D. Chase, Inc., Industrial Engineers, Chicago, Ill.

and in which manufacturing can be conducted at a profit.

It goes without saying, of course, that it is not possible always to obtain raw materials in the place in which the goods are to be produced or marketed. The question, then, of freight rates and service on raw materials versus finished product must be considered. The same applies to the question of fuel and labor. It is frequently possible to import labor if none is to be had locally. It seems almost superfluous to emphasize the need of a ready market. But thousands of businesses have failed because of such a lack. Competition should always be considered, as it frequently destroys a market. The growth of a city or of a state is often governed by the development of a leading industry, and many minor industries are thereby affected.

Given the city or town in which location is found desirable, to obtain a site the process of elimination must be repeated, bearing in mind the following: railroad and teaming facilities, labor supply, transportation of labor, housing of labor, sufficient area for present and future needs, adequate water, sewage, light and power facilities, accessible market.

The railroad will handle the raw materials and finished product from their sources to the plant and from the plant to market. This means that the site must be located on the proper railroad or railroads. If teaming facilities only are required the site must be adjacent or accessible to well-paved streets, as the modern product must be handled by truck rather than by team, and the length and cost of hauling for both raw and finished product must be determined beforehand.

A successful plant must be adjacent to the kind of labor, as well as the quantity of labor which is necessary, and frequently different sections of the same city offer a wide difference in the availability of the necessary labor. An industrial concern is frequently put to large expense to provide transportation for employees, and many factories are at a disadvantage because employees will not walk or ride great distances to work. It is as important to transport labor satisfactorily as it is to transport materials. This point should not be overlooked.

The employer's responsibility for the moral and physical welfare of his employees no longer ends at the gate. Our government is of necessity recognizing this obligation for its employees in many branches of the service. Proper homes, schools, churches, amusements, playgrounds and parks should be provided for the worker, and due to the inability of the average city administration to provide these necessities, the employer must do so. It pays, too, as has been proven repeatedly.

Provision for Future Needs

The man who is content to build a plant which has no opportunity for expansion, is putting a limit on his output, on his own ability and that of his successors, which frequently become a very serious handicap. Many manufacturers are today up against the wall of reduced profits and limited production which results in an ultimate stagnation of business, due to inability to grow and expand and to thus care for growing accounts. Excess ground is necessary not only for the future, but as a provision which is daily becoming more important; i.e., for the storage of raw and finished materials. Formerly the freight car served as a storage yard for raw material, and frequently the finished product. This is no longer the case, owing to car shortage and increased charges for holding cars.

A most important asset of a plant is a good dumping ground for waste. Many a concern has made valuable land by filling up ravines or marshes, and so turned a loss into a profit. Some plants spend thousand of dollars in the cartage or shipping away of refuse. This amount would look a lot better on the other side of the ledger, and if capitalized, would go a long way toward a new plant.

Every industrial plant has adequate water, sewage, light and power facilities to provide for in various ways. Municipal and state regulations must be studied to see that adequate provision can be made without violation of ordinances or laws. An electrical steel furnace, for instance, should not be installed until rates for current are definitely ascertained.

A newspaper in order to get its edition on the streets and in depots to compete with other newspapers must have a plant so located that the time taken for

Steel trusses employed on top floor to provide clear manufacturing space.

distribution is a minimum. While time may not be a factor in the distribution of some products, the plant should be so located that cost of trucking and delivery is at a minimum, either for delivery to local plants or to railroad depots. This means a short haul and good roads.

Analyzing Plant Requirements

Given the site of the plant, which meets the requirements outlined above, the determination of, arrangement and the type of buildings is the next essential, and this resolves itself into an analysis of layout of buildings, types of buildings, mechanical equipment, proper handling of plant design and construction.

The layout of a plant as distinguished from its design, is a production problem. The plant is a part of the investment for manufacturing, and its layout must be considered primarily from the standpoint of manufacturing or production results. The first step, then, in the layout of a plant is the proper solution of this production problem. Sometime may be required to accomplish it, but the ultimate success of the plant, and that means low-cost production, depends on the correctness with which the analysis of what, how and how much the plant is to produce, is made.

The information and data gained in this study is frequently the means by which large economies are affected. This is true because when the manufacturing operations are properly planned and co-ordinated in advance of actual building design, and then the building is laid out to suit these operations, floor space can be greatly conserved. The study of layout also brings up the matter of proper equipment, and when the layout of equipment is intelligently considered, the floor space required for production is often still further reduced. This correspondingly reduces the investment for a plant necessary to turn out a given amount of product.

The process of making anything, from pills to gun carriages, should be a straight-line process from start to finish; in other words, there must be no back-tracking, and from the receipt of the raw materials to the delivery of the finished product, the shortest and most direct line of operation in sequence must be employed. Such an arrangement conserves time, reduces floor area required, cuts labor costs, and actually means, without qualification, the success or failure, from a financial standpoint, of the modern plant.

Various Types of Buildings

The buildings to house an industrial plant should be decided upon after the layout of each and every department and their inter-relationship is definitely settled upon. Only with this information at hand can a suitable building be designed, and in the design of this building all of the points which have been discussed above should receive most careful consideration. It is true that the statements above seem so simple and obvious that it is almost unnecessary to outline them, but the fact remains that these questions are not often considered carefully, and labor and money-saving features are not thought of.

There are in general three types of buildings which are applicable to industrial uses, namely, timber construction, structural steel, and reinforced concrete. Timber construction lends itself to a variety of occupancies, owing to its adaptability to various requirements. A heavy timber construction can be economically used for loads as high as two hundred and fifty pounds per square foot. "Mill construction" is a term used to designate timber construction where no small pieces are used; the minimum size having a cross-sectional area of approximately one hundred square inches. This reduces the liability to complete or rapid destruction by fire. Mill construction, strictly speaking, is seldom used, but it can be intelligently modified without materially increasing the fire hazard.

Timber construction has one handicap in that with heavy loads the spans are comparatively short. This necessitates a great many posts, which is usually an objectionable feature, as it interferes with economical machine occupancy and other layout. Timber construction has been developed in various parts of the country in a very interesting manner, to meet the requirements of local industry. In the eastern states, where the term originated, large cotton mills are built

Interior of mill construction type of building

of the so-called "standard mill construction." Structures of this type are seldom seen in the West, greater attention being paid here to larger window areas and better lighting, and to the introduction of steel in part, in the construction.

Shoe factories and tanneries throughout the middle eastern states are built with wooden siding, and are popular in spite of the extreme fire hazard and short life. In the central states buildings of modified mill construction are built with laminated floors. This is a solid floor construction of uniform thickness, entirely eliminating the use of joists by spanning the floor which is laid on edge, from one girder to another. This floor is popular in spite of the fact that it is subject to excessive vibration and frequently gives trouble through dry-rotting.

(Continued in August issue)

Ottawa Trouble Not Settled

There is a possibility of an early settlement to the strike of the Ottawa inside woodworkers. The woodworkers have been out for about six weeks without any settlement having been reached. The employers refuse, absolutely, to deal with the men as a union or with a union agent. If the men will return to work each employer will attempt to satisfy the demands of his own men. As a result of conferences held it is likely that the men will resume work and that a board of arbitration will be appointed to settle all differences. About 450 men are effected.

Never let a cutter become so dull that it burns the wood when the feed motion is stopped. You will lower the temper of the cutter, and it will require retempering before it will be up to its proper standard.

Wood Turners Gather at Niagara Falls

Second Annual Convention of National Association of Wood Turners Unqualified Success—Various Subjects of Vital Importance to Industry Dealt With—Many Stirring Addresses

The National Association of Wood Turners held a very successful and enthusiastic convention at Niagara Falls, Canada, on June 15, 16 and 17. About one hundred and fifty delegates were in attendance and many questions of vital interest to this industry were threshed out. J. W. Cameron of the Canadian Handle Co., Strathroy, Ont., gave a cordial address of welcome to the American manufacturers on behalf of their Canadian fellow-craftsmen. The spirit of good-fellowship which was the keynote of Mr. Cameron's address was very much appreciated and received an enthusiastic response.

The principal address of the afternoon, "The Job We Face," was given by the general secretary, W. A. Babbitt. This address was an admirable review of present conditions, pointing out that business is seeking a firm foundation and an increase of production of essentials by eliminating non-essentials. Special attention was called to the necessity of economy in manufacture. His address made it quite evident that the worst competitor is the stumbling and failing one and the big job of the Association is to take this competitor and make him a successful and intelligent competitor, one who knows what it costs to manufacture his product and where his markets can be found.

Wednesday morning was taken up by a discussion of the hardwood situation. Mr. J. W. Cameron, Canadian Handle Co, Strathroy, Ont., reviewed the Canadian lumber situation. In the absence of F. H. Thomas. F. H. Humes very ably covered the lumber situation in the North as well as in his own section, the East. Chas. L. Harrison, Himmelberger-Harrison Lumber Co., Cape Girardeau, Mo., addressed the meeting on the hardwood situation in the South and brought out that the production averaged only 27 per cent. of normal due largely to excessive rains. W. A. Thomas. Northern Wood Products Co., Glidden, Wis., discussed the hardwood situation in the West and reported about 60 per cent. of normal production of hardwoods in his section last winter, giving as a principal reason the heavy snows. He intimated that cost of getting logs out of the woods ran as high as $22.00 per M in different camps. Official view of the hardwood situation by R. G. Lewis representing the Canadian Forest Service and A. F. Hawes representing the United States Forest Service, concluded the program for the forenoon.

The first half of the afternoon session was in the form of sectional meetings as follows: Spool and Bobbin Manufacturers, who met for a short discussion and then joined the meeting of Novelty Manufacturers; Hickory Handles and Tool Handles; Dowel Manufacturers: Enameled Products. These meetings were followed by the discussion on labor conditions.

The Annual Banquet was the crowning success of a highly successful convention. A menu excellently prepared and served, a good orchestra, songs, pleasing banquet souvenirs, flowers, speeches by men who had real messages, and a splendid feeling of good-fellowship, will keep this banquet long in the memories of those present as being one of the most enjoyable and yet most profitable evenings ever spent.

The banquet started with the singing of "The Star Spangled Banner" and "God Save the King." The toasts were as follows: "Within the Law," by Hon. Geo. W. Alger, New York City; "The Job Ahead of Us," by Andrew H. Phelps, U.S. Chamber of Commerce, New York City, and "The Crisis of Democracy," by Dr. Charles A. Lippincott, South Bend, Ind. These speeches were excellent from every standpoint and very much to the point, or as several said, it was more than worth the expense of attending the convention just to hear those three talks.

Thursday morning was taken up by a business meeting of the Association. This included the Reports of the General Secretary, the Treasurer, and of committees, the election of officers, general business and the discussion of the program for our second year of activity as the National Association of Wood Turners, Incorporated. The program for the year was officially adopted as read, and the members demonstrated their complete faith in this program by raising a guarantee fund of nearly thirty thousand dollars to see it through.

The officers for the ensuing year are: L. C. Bump, Newton Thompson Mfg. Co., Brandon, Vt., President; Wm. Cook Rogers. Piqua Handle & Mfg. Co., Vice-president: L. A. Walker, Stephenson Mfg. Co., South Bend, Ind., Secretary-treasurer; Wm. A. Babbitt, South Bend, Ind., General Secretary.

The closing session was taken up by a discussion of "Dimension Stock and Its Relation to the Manufacture of Wood Products." General secretary W. A. Babbitt spoke on its relation to cost accounting and the stabilization of the wood turning industry. Mr. L. A. Walker, Stephenson Mfg. Co., South Bend, Ind., explained its relation to production speeds. Mr. C. L. Harrison, Himmelberger-Harris Lumber Co., Cape Girardeau, Mo., and Mr. C. E. Van Camp, American Hardwood Lumber Manufacturers' Association, Memphis, Tenn., presented the Dimension Stock Problem from the lumberman's viewpoint.

The following resolutions were adopted:

Whereas, we, the National Association of Wood Turners, Inc., in convention assembled at Niagara Falls, Ontario, June 15, 16, 17, 1920, desire to crystallize some of the deep impressions of this Convention,

Be it Resolved:

That we express our hearty appreciation of the welcome extended to us by our brethren, across the imaginary line of division three thousand miles long, without a ship or a gun, the wood turning fraternity of Canada, and solicit their co-operation and fellowship in our endeavor to establish improved conditions in our industry.

That we express our sense of obligation to Dr. Chas. A. Lippincott, Mr. Andrew H. Phelps, and Hon. Geo. W. Alger for their splendid addresses at the Banquet and to Mr. R. G. Lewis and Mr. A. F. Hawes for their very helpful and

practical reviews of Forestry problems in Canada and the United States.

That we have a keen sense of gratitude for the Providence that has granted us a General Secretary of such wonderful versatility and efficiency and high ideals as Mr. W. A. Babbitt, and that we wish to impress upon him our appreciation of his splendid services and our earnest desire that he continue that work which for two years he has prosecuted so successfully. That we realize the need of better understanding between employer and employees and desire to study, adapt, and apply the principles emphasized so impressively by Mr. W. A. Thomas and Dr. Lippincott for the mutual benefit of all interested in our industries.

That in view of the fact that our forests are being cut four times as rapidly as they are being grown, we urge our Representatives in Congress to a policy of generous support of the Forest Products Laboratory at Madison, Wis., and all legislation for the advance of practical forestry, and we pledge our support to all kindred legislation in our respective State Legislatures.

That we urge upon all branch associations the immediate establishment and prosecution of a systematic and adequate financial policy in support of the National Association.

That we extend our thanks to Wood Turning magazine for the splendid support given the Association and for supplying the appropriate convention badges, and to Schutz Bros, Inc., New York City, for the novel and appropriate Convention Banquet Souvenirs provided by them.

Production System for Woodworking Plants

Accurate Record of Material on Hand—Keeping Tab on the Lumber Yard—Shortages Eliminated by Efficient System—Jigs and Forms as an Aid to Production.

By L. F. Simpson*

Second Instalment

The raw materials used in woodworking plants are essentially of wood but in addition there are many items that are of equal importance: for instance, glue, screws, finishing material, and other hardware trimmings and fittings must be kept on hand for the construction and assembling of the work. Materials are purchased and materials are necessary for production; therefore a purchasing department is so closely related to the production department that best results can be obtained if the two departments are responsible to the one head, the factory manager, who will in consequence be kept well posted as to deliveries and the quality of the materials used. Lumber is the chief item of raw material entering into woodworking and should be carefully selected, bearing in mind that a few dollars saved on the purchasing price does not always work out to best advantage in the long run.

A complete record of all material should be kept from the time it is received until the finished product is complete. It is further, more difficult to keep an accurate record of the lumber used than of any other material. A simple method to keep the yard in order is to number each pile and then make a sketch or chart of all the piles in the yard, giving their exact location, and on this record the quantities put on and taken off each pile. This chart should be made in duplicate, one copy for the yard foreman, who is responsible for its accuracy and the other for the stock clerk. If this is entered up daily, a perpetual inventory is on file, which may be checked up at a moment's notice. A card file or record is also kept, for instance, for immediate reference, of all lumber passing through the kiln. In other words, the records kept should be so completed and so arranged that all materials can be readily located and checked at any time.

Keeping Track of Veneers

Veneer stocks are another source of trouble, as it is difficult to keep them in order and to avoid waste. The veneer stock room should contain a number of racks, varying in size to suit the dimensions of the panels kept in stock. Long racks two or three tiers high, that will take the flitches as received from the manufacturer, will be found convenient. Storing the veneers in racks will eliminate the greater part of the loss from breakages and will aid in sorting out the material when required for use. All ends or cuttings from the flitches should be cut to stock sizes and put in racks. If the production requirements of a plant are definitely worked out, they will constitute a basis from which definite quantities of the various sizes and materials required may be computed.

Shortages of materials are the cause of many vexing delays and it is, therefore, very essential to have some means of avoiding or eliminating such delays. By having an efficient stock room system and knowing the stock requirements well in advance, considerable time and labor may be saved. Any simple filing system may be used in this stock room that will give definite quantities, location and a perpetual inventory. Bins and racks suitably arranged for the stock and labelled with part numbers, names and quantities of the various items, clearly marked, will aid the stock clerk in locating the various materials required and thus shorten the time the workmen may spend at the wicket waiting for material.

Bill of Material as Basis

In the production department a bill of material is made up covering every detail and the various parts are given numbers. From this bill of material the shop orders are made out for the parts to be manufactured in the plant and requisitions for the purchasing department for items to be obtained from outside sources. Records are kept of each part, by the production department, on a 4 x 5 card file. One card is made out for each item, showing the number required for the particular quantity of cabinets to be made, 500 or 1,000 whatever it may be. When parts are received into the stock room ready for use, a copy of a receiving report is sent to the production department. The quantities received are recorded on the above-mentioned card and the balance still to come is also noted. The quantity of each individual part required for the output each day for a week or as far ahead as it is required to make or obtain each particular part is noted on the top of each card.

In the stock department a minimum quantity of every part is recorded on the bin or rack card. This minimum is based on the production for one or two weeks ahead or longer, if it is thought advisable. A longer period would be allowed where the material is

*General Machinery Co., Toronto.

shipped in from outside sources. Each day the stock clerk notes the quantities in each bin or rack, and if the inventory of any part is nearing the minimum allowance, a low stock report is made out by the stock clerk and sent to the production department. This department immediately takes steps to replenish the supply either through the purchasing department or, if it is a manufactured part, a shop order is issued to the mill or whatever department is concerned. In this way a close check can be kept on all material and delays avoided.

Methods of Operation

Under this heading we will outline the various operations and departments through which the component parts and the work itself must pass in the course of its construction. From the yard and kiln departments the raw lumber passes into the mill-room and then on through the veneering, cabinet, varnishing, rubbing, trimming, burning-in or touching-up, inspection and finally to the packing and shipping departments.

The mill-room or machinery department is where the raw lumber is cut and dimensioned and worked into the component parts of the article produced. From the breaking-out saw the materials should be kept on record, so that at any minute the time required to get delivery of a certain part may be obtained and figured on by the production department. As we all know, hand-work is expensive, so that all the work possible is done by machines and production increased through the aid of jigs and time-saving devices. Many short cuts can be made that will materially increase the production of this department. As this article deals with production from the standpoint of the manufacture of phonographs, we will intimate how time may be reduced on turning out this product. Special jigs may be designed that will effectively aid in making the horns, boring the doors, rails, slotting doors for hinges, splice cuts on top moulding rails and rail posts. A good plan is to secure the co-operation of the employees and try and have them make suggestions that will ease the work and tend to increase production. Many good ideas may be secured from this source if a little encouragement is given. Some firms make a practice of paying small amounts in cash for all ideas sent in and adopted. Other manufacturers have secured the co-operation of their employees by adopting the group bonus system, where each group of men benefit by any increase in production from their particular department. Thus they not only take a greater interest in their work but are encouraged to work out labor-saving ideas and methods.

The core stock for panels is completed in the mill-room and then sent to the veneer department where the necessary veneers and cross-bandings are laid and the stock seasoned. After the built-up panel has dried out thoroughly it is returned to the machine shop for the final trimming and sanding. All work is sent from the machine department to the stock room where it is issued out for assembling or for further operations on the presentation of signed stock requisitions.

Canada Has Many Fine Woods

Could be Used to Good Advantage for Interior Work—Birch an Ideal Wood for Enamel Finish—Keep Finished Samples of Different Woods to Show Customers.

By J. J. Webb

The article in the June "Canadian Woodworker," published under the heading "Why Not Use Canadian Woods," was, to my mind, timely, and written along the right lines. More publicity of a similar nature should result in stimulating a greater interest in our native woods. We have many fine woods in Canada, and it seems a pity to see them shipped out of the country by the carload, or if used locally, disguised, and sold as an imitation of some other wood. Such woods as birch, maple and ash do not need to be misrepresented, as they have qualities which should enable them to command a good volume of business if disposed of, in the open market, solely upon their merits. The author of the above-mentioned article did not go into the subject as thoroughly as he might have. He dealt with native woods solely from the standpoint of the manufacture of furniture. A considerable amount of hardwood lumber is used annually for floors and trimmings in the numerous homes, banks and office buildings that are being erected on every side. The hardwoods commonly used for this purpose are nearly all imported and consist of such woods as oak, chestnut and a certain amount of poplar.

Educate the Canadian Home Owner

There does not seem to be any logical reason why these particular woods are in demand for interior work other than that they seem to be in popular favor. The public is supposedly fickle and their tastes can be educated or influenced along any desired lines, so why should not the woodworkers engaged in manufacturing and handling building material and interior trim sell the idea of local woods rather than push the sales of any other variety.

Many woodworkers seem to be of the opinion that with the exception of birch, native woods are not to be had in sufficient quantities to make it worth while dealing in them. This is not according to facts and figures. True, Canadian-grown chestnut and oak are not any too plentiful, though if one were looking for these woods, he would be able to secure a few carloads from time to time. Such stock as maple, birch, ash and elm are more abundant and a dependable supply is available to cover any anticipated demand. Birch is to be had in large quantities and is exported to the United States by the millions of feet. The statement has been made that fully 75 per cent. of the hardwoods cut in Canada are shipped out of the country. This is partly due to the apathy displaced by Canadian manufacturers toward native material.

Let us consider birch for a moment. The many qualities of this wood are too well known to need any commendation. It is plentiful, may be had in any desired grade, seasons readily and takes a fine finish when machined. When finished properly it has a beautiful grain and takes an excellent finish—it must when it can be passed off as an imitation mahogany.

If this wood were to come into general favor for interior work, just think of the pleasing variety of effects that could be secured through its use. First,

Showing beautiful, wavy figure of curly grain birch

we have the white birch. This, when finished in natural shades, would make an ideal trim both in color and beauty and dignity of figure for the bedrooms, upper hall and the lighter rooms of the house. For the more pretentious quarters where the heavier furniture is installed, darker red birch trim could be employed. The color of red birch, if finished in natural, is one that works in and blends readily with the majority of color schemes. This is a feature that should be considered in choosing the material with which to trim a high-class house. Both red and white birch have a beautiful grain, one that gives a variety of figure and a pleasing contrast in a quiet, dignified way. It is neither bizarre nor loud and its introduction into any home signifies good taste on the part of the person responsible for the choice.

Another beautiful species of birch, though, perhaps not so plentiful, is the curly-grained variety. The accompanying illustration shows the wavy figure of this wood. Curly-grained birch may not be available in large quantities, but one can usually secure enough for some select job where something unusually attractive is desired or for some choice line of cabinet work. One hears many laudatory remarks concerning the beautiful trim and panel work and the attractive effects secured in the Hotel Manhattan, New York. This hotel is finished throughout in curly-grained birch.

More Ash Could be Used

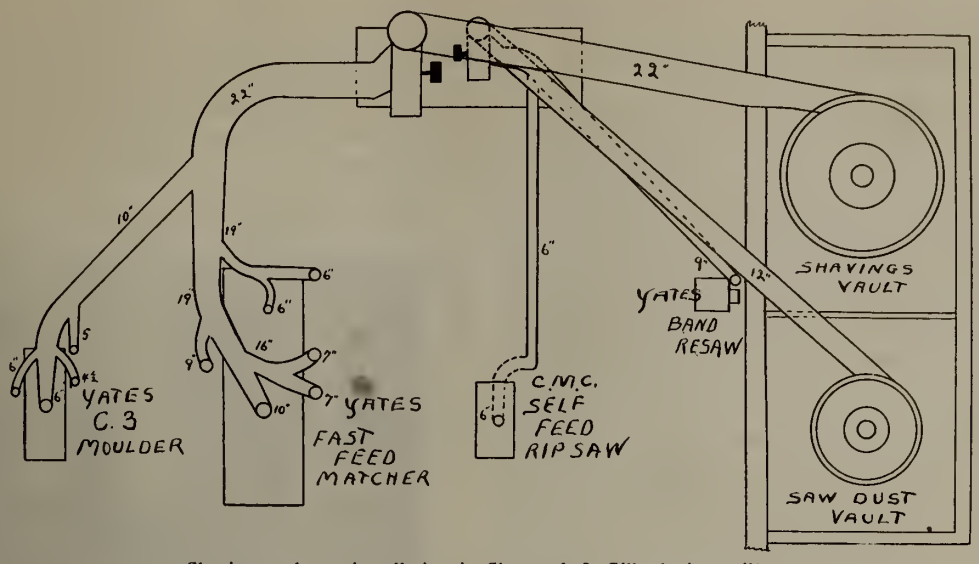
Ash has a fine, pleasing grain, and takes a good finish. It is used to a certain extent in interior work but should be more in general favor than it is. The American manufacturers of interior trim seem to realize the value of Canadian ash for house and office interiors, as many carloads of Canadian white ash are shipped annually to certain United States manufacturers. It would seem to be a case of where "A prophet is without honor in his own country." If there is sufficient ash available for export, surely there is enough to make it worth the Canadian manufacturers giving it their consideration.

An Attractive Softwood Trim

One wood that appears to be growing in popular demand for house finish is British Columbia fir. It is found installed in many of our medium and better-class homes. The finish usually applied is a natural oil or varnish finish, though beautiful effects may be secured by using some warm brown stain and bringing out the high lights. This wood may be had in practically three grains, viz., edge, flat and curly grain and in any desired quantity. This latter grain gives a very pleasing wavy effect.

When the interior is to be painted or enamelled there are many woods that might be used. For high-class enamel work birch has proved itself to be the superior of any other wood. Its fine, even texture and absence of gums particularly adapt it for a smooth, permanent enamel finish. Basswood, pine and fir are also used for enamel and paint work. With the more resinous woods difficulty is often experienced in preventing the rosin and gum penetrating through the paint or enamel. This can be overcome to a certain extent by coating all knots and any gum spots with a good, heavy shellac.

Finish up a few, short pieces of birch, ash, basswood and fir and the next time a customer asks for interior trim, show him these finished samples and point out the beauties and desirable features of the different woods. It may surprise you what a demand might be worked up for material in native woods by a little consistent, thoughtful effort.



Shavings exhaust installation in Sheppard & Gill planing mill

Does Your Exhaust Fan Take Much Power?

Inadequate or Antiquated Shavings Exhaust System Actually Increases Overhead and Retards Production—Power Consumption Important Item—System Designed for Requirements of Each Individual Plant

By J. C. Heath

An efficient shavings exhaust system is a real necessity in the modern woodworking plant. There are many reasons why this is so, such as keeping the air free from dust and shavings tends for more healthy workmen, better working conditions, reduces the fire hazards, lengthens the life of the various machines, increases production and decreases the overhead and manufacturing expenses.

The statement that a dust-collecting system lengthens the life of the equipment may seem far-fetched, but when one stops to consider that dust is the great destroyer of bearings and that nothing causes a bearing to wear so quickly as a constant supply of dust, it stands to reason that if this were eliminated, the bearings of the machines would not require the same amount of attention and would not need to be replaced so often.

One still finds plants that have not been provided with some form of dust-collecting system, but happily these are few and far between. Among the factories which operate a system of this kind, it is doubtful if the terms "efficient" or "economical" could be applied to all the installation and methods employed.

Designed to Industrial Requirements

There is more to a dust-collecting system than a few pipes, a fan and some form of collector. To be successful and economical in operation, it should be designed and built to suit the peculiar requirements of each individual plant. The subject is too large and too complex to enable any hard and fast rules to be laid down for designing and installing a dust-collecting equipment. It is work which calls for the services of an experienced engineer, one who has made the study of dust-collecting methods and who has designed and supervised numerous installations. It calls for judgment of a high order, for in most cases the success of the installation depends largely on the ability of the man in charge to apply his experiences to the peculiar problems encountered in your plant.

Formerly when power was comparatively cheap and seldom considered, the horse power required to drive the fan was considered of little moment. This is all changed and to-day one of the prime requisites of a successful installation is that it will operate with a minimum amount of power and incidentally expense. This means that if a large capacity system is installed, with pipes and connections larger than are actually needed for the various machines, the power bill will be high. It stands to reason that it would require a large fan to keep the larger volume of air moving at a rate that would carry shavings and sawdust to the collector. A large fan means more power; therefore in working out a system, while as far as possible provision should be made for any machines that may be installed, yet the main idea should be to adapt the whole installation as nearly as possible to the present requirements of the plant.

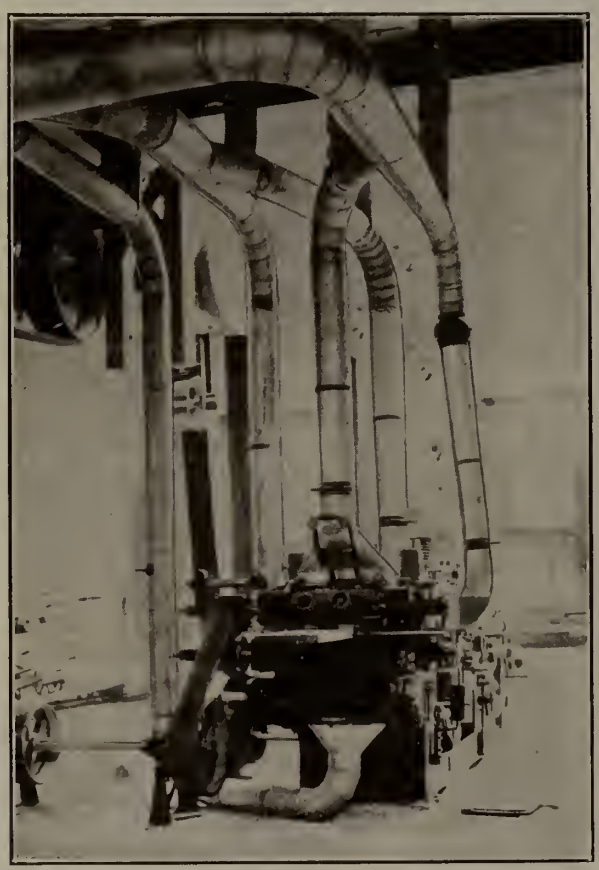
As An Aid to Production

On the other hand if the pipes used are on the small size, they will not be able to handle the amount of refuse thrown off by the different machines, and would likely clog, give trouble and retard production. These latter remarks apply to the system as a whole or to its application to any individual machine or even cutterhead. It has often been found when new equipment had been put in, particularly fast speed production machines, that the dust-collecting system in the plant was not adequate to meet the increased volume of shavings which had to be removed. As a consequence the new machines could not be operated to capacity but only to about half speed, and thus production was seriously retarded. Overloading the system would have its effect on all machines connected up, for it could not handle all the dust and shavings made.

Many factory owners have found that making a few changes to their shavings exhaust system has been the means of speeding up production throughout the plant.

Increasing the speed of the fan is often adopted as a means of increasing the capacity of the dust-collecting system. This may have the desired effect but at a high cost in power consumed. The increase in speed is not directly proportionable to the increased power consumption for doubling the speed of a fan, means that just four times as much power is required to bring it up to the new speed. The better and logical way is to change the system so that it will be able to handle the new demands which are made upon it.

The adoption of the electric drive has focused the attention of many manufacturers on the amount of power used in driving the fans of the dust-collecting systems. In the old days it did not seem to matter if 20 or 25 horse power, perhaps about one-third of the total power used, was consumed by the fan. Today when many power companies base their charges on the maximum demand basis, a few extra horse power affects the rate on the whole plant. This has led, in many cases, to the installation of smaller units or systems to serve small groups of machines. While the initial installation costs may be higher where the group system is employed, the savings effected through a lower power consumption and consequently a lower power rate, should pay a nice dividend on the additional investment. Another feature is that if for any reason a certain group of machines is idle, the fan on that particular system may be stopped, with a further saving in power.



American hardwood flooring machine fitted with shavings exhaust piping

Some firms have carried this idea to the extreme limit and have installed individual fans, driven in many cases by individual motors of from one to three horse power, on each machine. This would be a very expensive installation, and while it would result in low power consumption, it is doubtful if the saving would justify the extra expense. It is a good idea, however, to have at least one system for the shavings and another for the sawdust. By keeping these two items separate, it is easier to find a market for this refuse.

The accompanying illustration show some installations made by the Toronto Blower Co. of Toronto. The sketch shows the layout of the shavings and sawdust exhaust systems in the plant of Sheppard & Gill, Toronto. It will be noticed that two fans are provided, one for the shavings and the other to carry off the sawdust.

Piping installation on Yates fast feed matcher and moulder

The fans used are by-pass which were designed specially for this kind of work. With this type of fan, the refuse does not go through the blades and consequently if damp stock is being worked, the dust and shavings do not adhere to the blades of the fan and reduce the efficiency of the system, as well as necessitating the stopping of the fan to clean the blades. In this particular instance these fans are driven by a motor which is connected to a jack-shift and then belted to each fan.

The shavings and sawdust vaults are constructed with hopper bottoms and are kept well above the ground. Thus a team may drive in under the vaults and take away a load of shavings or sawdust simply by opening a small slide in the bottom of the vaults. This type of vault also makes it easy to bag or bale this material for any market that may be available.

Preparing Belt Ends for Splicing

Where the ends of a belt are being trimmed—that is, cut down to a wedge end for an endless splice—a broad wood chisel, the cutting end of which has been ground to a convex shape, is a convenient tool for the roughing stage of the process. After the roughing has been done the belt ends can be finished off with a sharp carpenter's block plane and then scraped to a smooth surface with the edge of a piece of glass. The cement or other adhesive is applied and after a sufficient time has elapsed the ends are brought together and clamped.

Diverse Products of Woodenware Plant

Business has Grown from Small Beginning—Manufacturing Many Lines of Both Domestic and Export Trade—Ball Bearing Transmission Equipment Installed

The manufacture of woodenware, with its multiplicity of lines, is always a very interesting branch of the woodworking industry. and the plant of the McMarlane Manufacturing Co. did not prove an exception to this rule. This progressive business was founded in Toronto about the year 1875 by the late Geo. McFarlane.

It originally occupied a small shop on King St. Later, about 1909, a larger plant was secured on River

A Cowan automatic knife grinder in Toronto factory

St., and the equipment installed there. As the business grew and new lines were taken on, it was found necessary on several occasion to make additions and extensions. Early this year the York Mills property on Main St. was purchased and plant moved to these more commodious buildings. The present buildings provide ample storage and manufacturing space and the site is of sufficient size to give storage room for the lumber piles and to take care of the growth of the business for many years to come. The present proprietors are Vincent and Percy McFarlane, sons of the original founder of the business.

Variety of Lines Produced

About seventy hands are employed, at present, producing such lines as extension ladders, step ladders, wash boards in zinc, glass and enamel, clothes horses, folding iron boards, bake boards, pantry stools, adjustable porch gates, folding veranda chairs, lawn settees, folding stools. children's sleighs, painters' ladders, trestles and extension planks. This list gives a fair idea of the extent of the operations, but other smaller articles are manufactured as well.

Many of these items are produced in large quantities. The firm does a large business in Canada and has many export connections. Wash boards are exported in carload lots to both Great Britain and South Africa. In addition an export business is gradually being built up in folding chairs, extension and step ladders. The new location enjoys excellent trackage facilities so that car orders are handled with despatch.

A large part of the material used is purchased partially manufactured. This applies to such stock as the material for sides and steps of the step ladders and the sides of the wash boards. The material is all dressed and moulded ready for cutting. When one considers that the fir, which is the wood chiefly used in the ladders, comes all the way from British Columbia, the saving in freight due to shipping the lighter dressed lumber, would almost pay for the cost of the milling.

The plant consists of the usual equipment of saws, double and single cut-offs, multiple spindle boring machines, planer, jointer, Fay & Egan straight edging and ripping saw and a few specially built production machines for doing certain of the operations. The metal pieces used are stamped out on a large press.

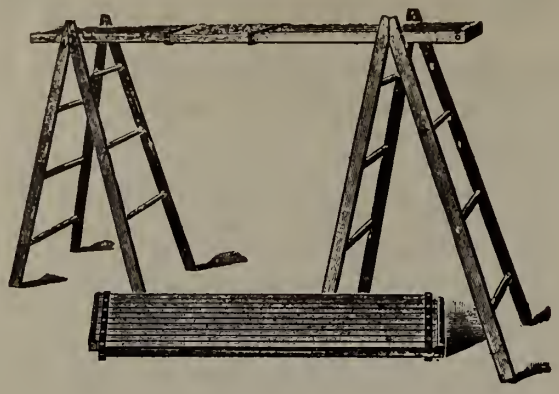
Ball Bearing Hangers and Pulleys

The transmission is equipped withChapman double ball bearing hangers and many of the loose pulleys run on ball bearings. While a complete steam plant consisting of two boilers and an engine is installed,

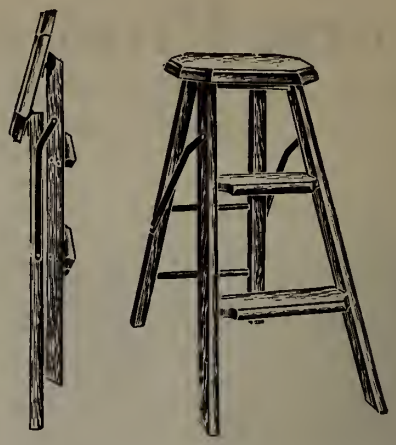
Jointing and ripping saw, Fay & Egan, in McFarlane plant

electric energy is the motive power used. Two large motors, one 40 H.P. and the other 25 H.P., together with several small individual installations, drive all the machines.

The assembling of the different lines is at present being done by hand. Plans are under way for the construction of several special machines to aid this end of the work. All articles requiring staining or varnishing, are dipped, usually as a final operation. The dipping could be speeded up by installing an overhead carrier system and arranging it so that the art-



Painter's trestle with adjustable plank



Folding pantry stool and step ladder

icles could be hung from racks. run over the dipping tank, lowered in the liquid, then moved so that they would drip on the drainage board and then out into a drying room. Some such method, which is under discussion, would reduce the handling in this department to a minimum.

Pantry Stool Ingenious Article

Two of the most interesting articles, probably because they are unusual, are the pantry stool and the adjustable verandah gate. The former is in reality a short step ladder, about 30 in. high, with a large stool top. It folds compactly and may be stood out of the way. It can be used as an ordinary stool, and when needed, comes in very handy for securing articles from high shelves or doing other overhead work. The verandah gate is often seen where children are and is used to keep the young folks off the street. It consists of a number of pieces rivetted together, lattice fashion, and is adjustable, by extending out, to fit any width verandah opening.

The extension ladders may be furnished in any lengths from 12 to 100 feet. They consists of roped ladders which may be adjusted to any height by means of a rope and small blocks or sectional ladders where one section pushes up and hooks to the rungs of the under one. These are usually made of B. C. fir or clear Sitka or aeroplane spruce.

The lines are all well made and give general satisfaction wherever purchased.

Indian Government to Employ Dry Kiln Experts

The United States Forest Products Laboratory at Madison announces that two of its experts in kiln drying have resigned to accept positions in foreign countries. Mr. C. V. Sweet and Mr. L. V. Teesdale, who have been with the laboratory for nearly two and a half years, will enter the forest service of the Indian Government. Mr. Sweet will have his headquarters at Dehra Dun, India, in the foothills of the Himalaya Mountains. Mr. Teesdale will be located at Rangoon, Burma, which is situated in the lowlands bordering the Sea of Bengal.

Both men will be engaged in the investigation of commercial methods of seasoning timber. Their work will differ only as geographical conditions affect the character and availablity of the timber, and will involve travel and exploration into all accessible parts of the provinces as well as laboratory research at the institutions already established.

India and Burma are heavily forested with exceedingly valuable woods, which, like all the other natural resources, are the property of the government. In the art of silviculture and its development the East leads the West, but in commercial processes of utilization of the wood products the East has much to learn from Western countries, especially America. The availability of the wood products for commercial use depends largely on proper methods of kiln drying, and it is as technical experts in this subject that Mr. Sweet and Mr. Teesdale enter the far Eastern service.

Furniture Industry in Strong Position

A questionaire was recently sent out to representative furniture manufacturers and retailers by an American furniture journal. The replies to the different questions furnish an interesting insight into conditions as viewed by the trade and their belief in the future prosperity of the industry.

The furniture monufacturers were asked "How far are you behind with orders ?" "How far ahead are you protected on raw materials ?" "What do you think of the lumber situation, and are signed non-cancellable orders advisable?" Fourteen manufacturers stated they were from one to three months behind with orders, fourteen. from four to eight months behind, and four stated they had twelve months' business on their books. Twelve were not protected on raw materials but were buying on the open market, fourteen had from one to three months' protection, nine from four to six months' and one was protected for seven months.

The manufatcurers replying were a unit in declaring that lumber was scarce. Nine thought lumber would go higher, nine lower, eight looked for conditions to remain stationary, while four looked for an improvement in the lumber situation. Twenty-three favored the signed non-cancellable order and thirteen were against it.

Of the dealers replying, seventeen thought that the future of the furniture business looked very bright, while thirteen were doubtful as to whether the demand would keep up or not. Most of the dealers reported a fair stock on hand and the majority were in favor of a signed order.

Is Your Band Resaw Giving Trouble?

Resaw Blades and Mill Require Special Attention—Amount of Tension Should Vary for Different Woods—Eliminating Cracks and Fractures

By P. E. Poole

Of course the first requisite in band resawing is to have a well-constructed and well-designed machine. The wheels should be nicely balanced, run perfectly true on their spindles without jar or tremble, and thus the saw while in motion, if properly tensioned and fitted, will run without vibration. This is very important. The wheels should be of such form as to give the requisite strain to the different portions of the saw blade, and the tension device for straining the saw be such as to exert a constant, even force at all times. A machine constructed faultily in either of the above particulars will cause breakage of saws, either from over-strain or from vibration.

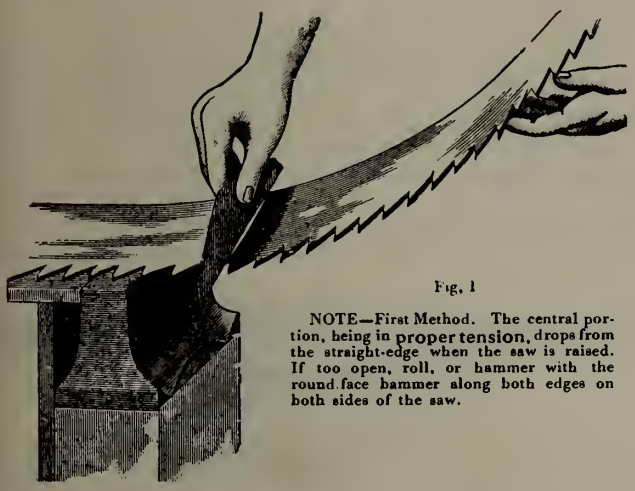


Fig. 1

NOTE—First Method. The central portion, being in **proper tension**, drops from the straight-edge when the saw is raised. If too open, roll, or hammer with the round face hammer along both edges on both sides of the saw.

Various authorities differ as to the exact form to which the face of the wheels should be ground. They should be as nearly flat as possible and still retain the saw blade in proper position, rendering it capable of withstanding the back-thrust brought against it when resawing wide stock or working at a fast speed.

Another no less important matter is a suitable place for fitting the saw blades, and the proper tools with which to work. The best resawing machine will prove a dismal failure unless the saws are properly fitted and we wish to emphasize the necessity of providing a light, roomy filing room, suitably heated and equipped with modern tools. While saws may be successfully filed and sprung-set by hand, it is not profitable to economize too much in the saw-fitter's equipment. The following equipment is listed as being about the equipment required by the ordinary small plant: Automatic saw sharpener, anvil, hammer, straight-edge and tension level, swage, pressure side-dresser, brazing table and saw vice.

Putting In Tension

As the toothed edge of the saw does the guiding, this edge should have the greatest strain, the back edge nearly as much, and the central portions expanded just enough to insure the saw blade doing good work. This is ascertained by actual practice. It is found that when resawing hardwood more tension is required than when resawing soft, straight-grained timber, as the more difficult the wood is to cut, necessarily the more inclined the saw blade is to dodge, and thus friction is brought against a certain portion of the saw blade, more especially near the teeth or cutting edge. This heats the blade, expands it, and leaves the cutting edge of the saw slack, so that it will dodge and do poor work.

To provide as much as possible against this occurrence it is found advisable in some cases to leave the back edge of the saw a little longer than the front, and thus, as the saw heats, the upper wheel is free to rise and the cutting edge of the saw will remain taut, while should the back edge of the saw be the same length as the front this would prevent its so doing; hence it will be seen that in resawing wide hardwood the saw blade must be fitted somewhat differently from that required when resawing soft-grained material. When the saw blade is in proper tension the central portion of the blade is expanded or opened up, so that when the saw blade is raised the middle will drop away from the straight-edge (Fig. 1). The usual mode of testing for tension is that shown in Fig. 1 and 2.

Preventing Cracks or Fractures

Still, some maintain that it is better to reverse this method, and press the saw down, as in Fig. 3 and 4. The former method is usual and most convenient, and in that case the loose places in the saw blade will drop away from the short straight-edge, and the first places will be drawn to it. With band resaws the width of the saw blade varies so much, also the material sawn, that it is difficult to state the exact amount of tension required. The tension should be as uniform as possible throughout the entire length of the saw blade. A fast place may cause fracture from undue strain at that point, a loose place from excessive vibration. The tension should be so adjusted that the saw will bear firmly upon the face of the wheel, the principal strain being near the edges of the saw.

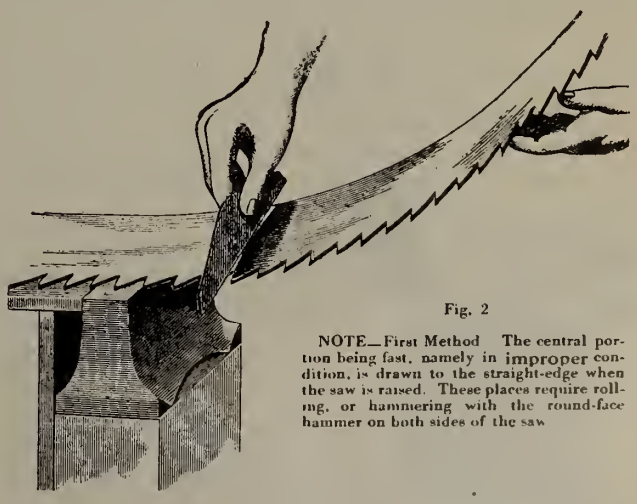

Fig. 2

NOTE—First Method. The central portion being fast, namely in **improper** condition, is drawn to the straight-edge when the saw is raised. These places require rolling, or hammering with the round-face hammer on both sides of the saw.

To adjust the tension, use only the hammer having a perfectly round face where it comes in contact with the saw and so nearly flat that it will not indent the saw with the blow you desire to use. Rolls, when

available, may be used for tensioning. If the face of the hammer is not perfectly round, using it will put a twist in the saw.

If the saw is too open—that is, if the central parts drop away too much from the level—hammer, or roll, the saw with the round-face along the edges lightly and equally on both sides until the proper adjustment is effected. If, on the contrary, the saw does not drop

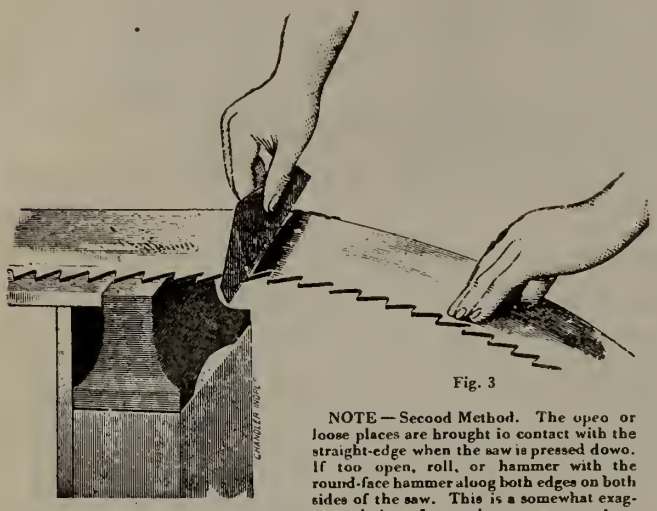

Fig. 3

NOTE—Secood Method. The opeo or loose places are brought io contact with the straight-edge when the saw is pressed dowo. If too open, roll, or hammer with the round-face hammer aloog both edges on both sides of the saw. This is a somewhat exaggerated view of a saw in proper tension.

away enough from the straight-edge in its central parts, use the round-face hammer or rolls over the central portions lightly and equally on both sides of the saw until the proper tension is obtained. Different portions of the saw will require different treatment, the result to be obtained being uniformity of tension the entire length of the saw blade, and in degree to suit the surface or crown of the wheels.

A trial of the saw with the small straight-edge or tension level, from time to time, during the process of hammering, with a final test upon the mill, will enable the operator to determine the degree of expansion of parts required. It is well to examine a new saw in this manner in order to obtain a proper stan-

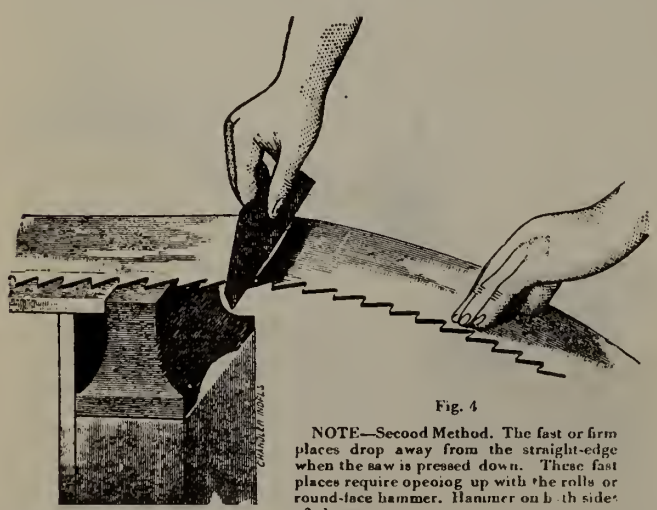

Fig. 4

NOTE—Secood Method. The fast or firm places drop away from the straight-edge when the saw is pressed down. These fast places require opeoiog up with the rolls or round-face hammer. Hammer on both sides of the saw.

dard, which, if the saw works well, may be adopted in practice.

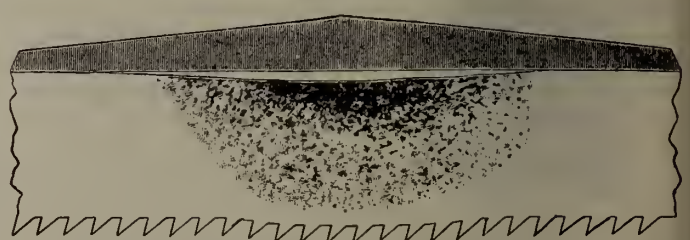
The pein hammer is to be used only in leveling, straightening and taking out twists. The faces of the hammer should be nearly flat, and the blow light, so as not to indent the surface of the saw. Heavy blows or a sharp hammer will crystallize the steel at the point of contact, and eventually cause fracture. The saw should not show marks of the hammer after hammering.

Lay the saw upon the anvil and leveling table; examine the portion of the saw which lies upon the leveling table by passing the short straight-edge over it at various angles. Whenever ridges appear, trace their direction or the angle at which they cross the saw with a piece of chalk, draw the part over the anvil and hammer down the ridges with the pein hammer. In hammering down the ridges the pein should always run in the direction of the ridge.

Crowning the Back Edge

Curves upon the back or toother edge of the saw are shown by placing the long straight-edge against the back edge of the saw on the leveling table. Mark the extent of the curve and its direction with the chalk.

The back of the saw can be drawn to a true line (see Fig. 5) by using the round-face hammer upon the hollow edge at the point of curvature, carrying the blows into the central portion of the saw sufficiently to prevent unequal expansion, and leaving the centre open as directed previously. The shaded portion indicates the part to be hammered. Light blows should be used, and both sides hammered equally, care being taken not to give a heavy blow upon the



Dark portion indicates where to hammer to straighten blade

extreme edge, which promotes fracture. If the back edge is rounding, the hammering must be done upon the toothed edge.

The back edge of the saw should be kept straight or a little convex, not to exceed ⅛ inch convex in fifteen feet length. The greater the convexity the greater the strain on the toothed edge. In straightening the back edge, be careful to maintain the tension. Examine the back edge frequently.

Owen Sound Strike is Settled

The Owen Sound woodworkers, who have been on strike for some weeks, have all returned to work. The employees of the National Table Co., Ltd., were the first to resume their duties. They were quickly followed by the employees of the other firms. The increases made average about ten per cent. The terms accepted were virtually the same as those that were offered before the men went out, so it is difficult to see what the men gained to compensate for the pay lost during their three weeks of idleness. It seems too bad that disputes of this kind cannot be settled amicably. When a strike occurs both sides lose. In many cases it is doubtful if the men even make up the losses entailed.

Speaking after the men had returned to work the president of the National Table Co., Limited, said he regretted very much that the strike had occurred and expressed the opinion that the same results could have been obtained without a strike.

An Opening for Canadian Enterprise

Large Quantities of Small Turnings Imported by Piano Action Firms—A Nice Business Awaits Aggressive Action—Other Lines Probably in Demand

Importing manufactured wood products into Canada, from outside markets, is like "taking coal to Newcastle." One would think that Canada with its vast timber resources would be self-supporting as far as the ordinary run of wood products is concerned. That this is not the case, was instanced in an article appearing in a recent issue of the "Canadian Woodworker," outlining the market for spruce sounding boards for pianos. About thirty-five thousand of these boards are used annually. An enormous quantity of high-grade spruce is available in our native forests, yet in spite of this plentiful supply of raw material, as far as can be ascertained all the sounding boards used by the Canadian piano industry are imported from American manufacturers.

Another opening for some energetic firm is found in another branch of this same industry. Each piano made requires what is known as the "action." This consists of the keys, dampers, hammers, levers and other hammer actuating and controlling mechanism. The manufacture of these actions has developed into a highly specialized branch of the piano industry. There are a number of concerns who devote their whole attention to the production of keys, actions and player actions for both domestic and overseas trade.

Many Small Pieces Used

Each action consists of ,roughly, seventy-five hundred pieces of all shapes and sizes. This number may vary for different actions, but is given as a fair average. Many of these pieces are small wood turnings of various sizes and shapes. As far as can be learned these small turnings are all imported from American wood turning firms. There should be numerous automatic turning lathes in operation in Canada that could handle these items, and it is a wonder that some of the more aggressive firms have not made an attempt to secure this business. The runs would be of sufficient length to make them worth while. The volume of business which could be secured should keep the lathes going for many weeks.

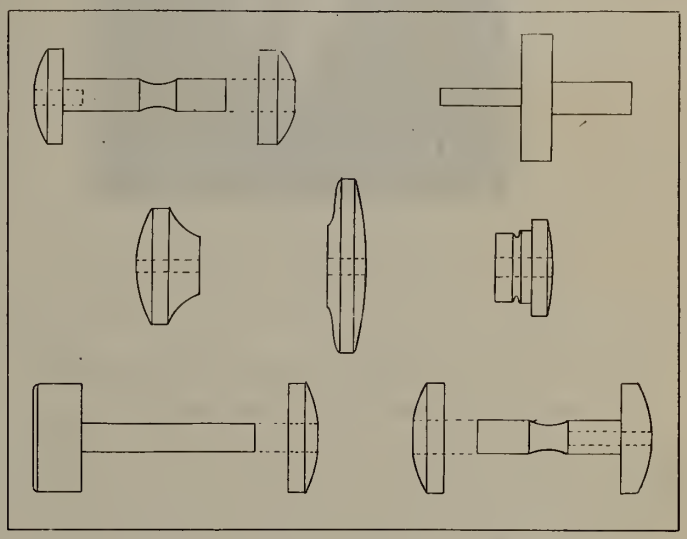
The accompanying sketches show some of the turned pieces required for action work. These are usually purchased in large quantities. One action manufacturing firm usually orders from two to five hundred thousand pieces of each individual item. There are three plants in Canada producing actions, and between them the number of turnings used each year must run into many millions.

The wood used is hardwood, such as birch and maple, but chiefly maple. It has been found that the Canadian hard maple is one of the best woods known for action work. The stock must be thoroughly seasoned and dried to a low moisture content so that the pieces will not shrink or check when finished. The stock used must be sound, free from all defects, and first grade in every respect.

Accurate Work Required

The turnings must be well finished and very accurate as to size. In fact, extreme accuracy is demanded for certain of the items, where the allowance, or limits of variation, is figured by thousands of an inch. Certain of the button-shaped pieces are assembled on the shanks of the longer parts. Here a snug fit is demanded. This calls for accurate boring as well as turning. Some of the longer pieces have a small hole indicated by the dotted lines, run part way through the centre.

If one were to look for opportunities of this kind there is no doubt that many other similar instances, where special turnings and other wooden articles were being imported, would be brought to light. It is



Samples of turnings used in piano actions

doubtful if wooden mixing bowls, mixing spoons and ladles, butter spades and similar forms of woodenware are being manufactured in Canada though such articles are offered for sale practically in every hardware store and must consequently be in strong demand. If any of the readers of the "Canadian Woodworker" know of any wood importations being made, where the article or articles could be manufactured locally, their co-operation in sending such information to the publishers of this paper would be appreciated.

To Distinguish Mahogany and Walnut from Red Gum

In the manufacture of furniture and cabinets a great deal of red gum is used as an imitation of mahogany or Cirassian walnut. When red gum is properly finished it can be made to look so much like either of these woods that only by very careful observation can the true be distinguished from the substitute. There is a very distinct difference, however, between red gum and mahogany or walnut. This difference lies in the size of the pores.

In mahogany, Circassian walnut, and black walnut the pores are so large that they can be seen very distinctly on a smoothly-cut surface of the end grain, where they appear as minute openings smaller than pin holes, but visible without magnification. On surfaced faces the pores appear as fine grooves, running parallel with the grain. They are even visible through the varnish, appearing as dark lines.

In red gum the pores are much smaller and can be seen only with a magnifying glass.

J. H. Baetz
Baetz Bros. Co., Kitchener
Chairman, Kitchener and Waterloo Branch

H. M. Snyder
Snyder Bros. Upholstering Co., Waterloo
Vice-Chairman, of the new Branch

Furniture Men Head New Organization

At a meeting of Kitchener and Waterloo manufacturers, held in Kitchener, Ont., recently, it was decided to organize a Kitchener-Waterloo branch of the Canadian Manufacturers Association. J. H. Baetz, of Baetz Bros. Furniture Co., Limited, Kitchener, Ont., was elected chairman of the new section, and H. M. Snyder, of Snyder Bros. Upholstering Co., Limited, Waterloo, Ont., was elected vice chairman. The Kitchener and Waterloo Manufacturers' Association, which has been active for some time, is doing splendid work. but it was felt that the support of the larger Canadian Manufacturers' Association would be invaluable in furthering the work of the local Association.

Why Furniture Industry is Shorthanded

M. Wulpi

We have been interested in the results of our recent canvas to ascertain the number of employees and the wage scales of the different branches of the furniture industry. In this connection it will be of interest to note the following figures taken from other lines of endeavor:

		Employees		
	Plants	March, 1919	March, 1920	Per Cent.
Woolens	50	24,986	48,361	93.6*
Men's Clothes	49	23,666	36,770	55.4*
Cotton Finishing	16	8,758	12,808	46.2*
Automobiles	38	91,668	123,434	37.9*
Hosiery and Underwear.	65	28,495	34,302	20.4*
Cotton Manufacturing	52	45,973	53,318	16.0*
Paper	53	23,976	26,625	11.0*
Leather	33	15,793	17,486	10.7*
Silk	49	15,188	16,750	10.3*
Boots and Shoes	70	58,392	63,710	9.1*
Iron and Steel	111	160,467	170,963	6.5*
Cigars	56	18,233	16,746	8.2†
Car Building	51	55,501	48,835	12.6†
Total	693	571,096	670,108	34.8*

*Increase. †Decrease.

With an increase of 199,096 employees in 693 plants we should have materially increased production, but the reports indicate that "Labor does not produce."

The 31,766 hands that the auto industry added may explain where some furniture help went and why the latter went short.

The textile industry increase seems to be heaviest and may portend increased production and a reduction in price of clothing.

Large Sash and Door Factory in Edmonton

The Hayward Lumber Co., Limited, Edmonton, Alta., are constructing a new sash and door factory, 66 x 164, two storeys high. This concern was founded in 1906 by G. E. Hayward, with headquarters at Vermilion, Alta. In 1916 they moved to Edmonton and took over the sash and door factory and lumber yard conducted by the Northern Lumber Co. The new plant will be equipped with modern machinery, including machines manufactured by such well-known firms as P. B. Yates & Co., of Hamilton, American Woodworking Machinery Co., Rochester, N.Y., Cowan & Co., and Canada Machinery Corporation of Galt, Ont. A Grand Rapids vapor kiln is being installed. The equipment will be driven by electric motors and the power plant used for heating purposes only. About 100 men will be employed and such lines as windows, doors, interior finish, store fronts, store fixtures, etc., will be manufactured.

This firm operate about 20 retail yards throughout the west and a large proportion of the product of the new factory will be disposed of through these yards. The cost of the new buildings, not including equipment, is anticipated to run in the neighborhood of $100,000. G. E. Hayward is the president of this company and John Hening secretary-treasurer.

One of the things which riles a good workman more than his most difficult work is to lose an hour's pay because he was half a minute late.

Designing Boxes for Maximum Service

Details of Construction Depend Largely on Service Demanded—Value of Reinforcements

By Malcolm W. Hill*

At present when our foreign trade prospects are so bright, the subject of export boxes is most pertinent and their design and the materials used in them must be given more serious thought than ever before—unless we are to again get condemnation due our boxes failing in overseas service.

Box design has been defined as the development of definite details for constructing boxes which will deliver their contents to the purchaser in satisfactory conditions at minimum cost. This is a concise statement of fact—but contains a great many implications which are anything but easy to analyze.

Deciding Details of Box

First, what are those details of construction that will deliver 100 pounds of glassware to Chili in safety—what are they that will give a good box for 100 pounds of dried peaches going to Melbourne—each case presents some entirely different problem and the box manufacturer is expected to help in solving these various matters and to aid the buyer or the exporter in choosing the best boxes for the individual duty wanted. To do this he must have some idea of the conditions of transit and handling all along the route until the destination is reached. True, it is the duty of the buyer and packer to secure this information, but when they are in error if the boxmaker can add a suggestion to set them right, he may not only get their gratitude and goodwill, but will forestall the complaints and condemnation that is sure to follow an unsuitable case—when the blame will too often be placed on "the rotten lumber in the cases." Real cooperation is what is wanted all along the line and this will safeguard everyone.

The reason for factory made boxes are several—convenience, time savin, standard construction, etc.—boxes have some advantages over bales and bundles with many commodities where any slight change in shape will do permanent damage; also boxes are many times easier packed, marked and handled. They serve as receptacles in collecting the miscellaneous articles making up contents and their rigid form provides the protection that is a necessity for many kinds of shipments.

The exporter must select his boxes with great care and with constant thought as to the needs of each individual shipment and the hazards it will pass through before reaching its destination.

Medium Weight Case Best

In general we may say that the medium weight case gets less of the terrible racking blows due to falls than the very heavy or very light cases, the heavy ones get damaged owing to the fear of personal injury among freight handlers who "stand away and let her drop," while on the other hand the little or very light case gets abuse just because it can be tossed about so easily

Therefore the medium weight cases may be constructed with a smaller factor of safety than the very heavy or light ones.

The rules as adopted by the National Association of Box Manufacturers are with few exceptions accepted pretty generally as representative of good practice, as their box types have been chosen after a long and successful experience. The box manufacturer who thinks the boxes are perfect and cannot be improved upon, however, is going to get a shock some time in the future, as competition is keen and he must keep up research studies or the other container people will get the business.

The strongest arguments the wooden boxmaker has had in the past has been the ancient reputation of the wooden box for long and reliable service under most all conditions and the ease with which the wooden case is classified as freight. But it must be remembered that a large amount of credit for the honorable performance of the ancient boxes was due to their being made of carefully selected stock and with individual skill in assembly.

Other Containers Growing in Favor

High costs of labor and materials have prohibited much of the individual care in construction now and in some cases it would not be justifiable, but on the other hand in many export shipments it is justifiable and this point must be recognized and the care put into the export boxes that they require as a first and vital factor to the safe arrival of the shipment.

The collection of damage and loss data should be carefully carried on with the necessary corrective recommendations and this information placed promptly in the hands of the people interested.

A curve plotted which shows the demand for wooden and other type containers for the past few years shows a steady gain in the newer types over the wooden boxes and containers. The fibre board and corrugated containers have taken a very large place in domestic shipments and may also be improved so as to give satisfactory service for export shipments, but the cost of additional reinforcements and strip seals, etc., will add very materially to the price, as the gluing takes time and skillful manipulation to give a tight and permanent job.

The reasons for the substitution of other containers for wood are first of all lower cost, then greater convenience in handling and, due to lighter weight, less freight charges. Again less skill is required in packing them than to pack and fasten a wooden box. The relative worth of different containers is not at all well established and until it is the arguments of first cost will have undue influence. The manufacturer who gets exact performance data on his product and that of his competitor will get the jump on the rest of the fellows.

Enormous Amount of Material Used

No exact data of recent date is available that I know of, but the immense amount of material used annually in box shooks is little appreciated; even five years ago it totalled some 4,000,000,000 board feet for

*Address before N. C. Pine Box and Shook Manufacturers' Association, Baltimore, Md.

shooks and another billion for veneer boxes, the exact figures in square feet are hard to get at on account of the varying thicknesses used and the waste due many methods of milling. But the amount in square feet is probably nearer 10,000,000,000 feet.

The tremendous increase in price of lumber at mill and the costs due storage and drying have caused many factories to turn out green lumber boxes that have been a serious detriment to the wooden box industry; it is doubtful if the fibre box salesman can use any stronger argument than to take his clients around through any big terminal and show the many cases of boxes collapsing through use of lumber with an undue amount of moisture in it when nailed and strapped up.

The bulletins and leaflets which are published and issued broadcast by the box associations have made the types pretty well known and hence the packing and shipping departments of most of the box users must be fairly well posted on the main advantages of the common types of boxes. The discussion doubtless in most cases resolves itself into whether cleats are necessary or not, and if so, what kind and size.

Reinforcement of Value

Now some radical points were investigated by the army packing men during the past war and one of the most important was the undoubted value of outside bindings of various kinds in insuring the safety of the contents of a box. If the weight is not great it was found that an uncleated box with proper strapping got there safely at times, though the lumber was too trashy for the purpose. Here, of course, also the contents of the individual case has a great deal to do with the results—if contents are such as to reinforce the box from the inside and absorb part of the blows without damage—a much weaker box will suffice, but if the contents are such that the blows damage them, then to deliver the contents safely the box must be greatly increased in rigidity and strength.

For boxes over 75 pounds the choice of cleated or uncleated is a question of convenience and lumber stock in hand—if you have the thicker material and can make the stronger box without a consequent tax in freight and duty charges, all right; if not, of course conserve weight by the use of lighter material and add the desired strength by cleating and banding. Whether cleats are inside or outside is a matter often depending on the contents.

In canned goods, for instance, with round cans, the corners are not occupied and so the use of a triangular corner cleat is a feature for real space saving and yet adds the proper strength.

The most important subject for the wooden boxmakers to investigate, in my judgment, is the better balancing of wood with metal reinforcing material —to ascertain with definiteness the amount of lumber used and the amount of steel to get economies in first cost and then the relation of this initial expense to the necessary added cost of making this wood-steel box safe for any contingencies under export conditions.

Tests have showed conclusively that with a little more reinforcing on the outside, packages made of very thin and weak lumber will hold together until the contents are demolished without collapsing sufficiently to spill its contents.

(Continued in August issue)

Practical Course in Boxing and Crating

The economic loss in shipping in the United States due to poor packing, poor containers, unnecessary first cost, etc., is conservatively estimated at not less than $500,000 a day for all classes of domestic and foreign shipments. This loss can be materially reduced by the use of properly designed shipping containers.

Practical training courses have recently been conducted at the Forest Products Laboratory to make available to manufacturers and packers the principles that underlie proper box and crate construction. The boxing and crating course has proved so satisfactory, that as long as there is sufficient demand by shippers and others interested in good container construction, the course will be given monthly starting in July, 1920.

The course consists of one week's instruction in boxing and crating under a staff of competent specialists. To cover the cost of conducting the course, a co-operative fee of $75.00 per man is charged.

Brief Outline of the Course

Tests on various types of box construction to show characteristic failures.

Tests to demonstrate the necessity of adequate nailing.

Demonstration to show the effect of using one, two and three piece ends, sides, top and bottoms.

Relative holding power of different kinds of nails.

Effect of using wet lumber for boxes.

Strapping: Method of application and efficiency.

Influence of grade of lumber and location of defects on boxes and crates.

Solid and corrugated fibre board and wire-bound boxes.

Crate construction and tests.

Selection and identification of woods.

Especial attention will be given to the specific problems of the men enrolled.

Firms or individuals interested in enrolling representatives should communicate at once with the Director, Forest Products Laboratory, Madison, Wisconsin.

Purpose and Organization of the Laboratory

The Forest Products Laboratory is a government institution of industrial research conducted by the United States Forest Service at Madison, Wisconsin. The aim of the laboratory is to promote economy and efficiency in the utilization of wood and in the processes by which forest materials are converted into commercial products. The personnel consists of over 200 engineers, chemists, specialists and assistants.

The results of the researches of the laboratory are given to the industries and individuals concerned through personal contact, correspondence, government bulletins, articles in the trade press, mimeographed circulars, technical notes and practical instruction courses.

Some of these days some rare musical genius, with true poetry in his make-up, and his soul steeped in and saturated with "concord of sweet sounds," is going to set the song of the buzz-saw to music, and then we will have an opera that will rival the music of the spheres.

There are several belt dressings on the market which the makers claim can make a belt give excellent service even when it is run dead slack.

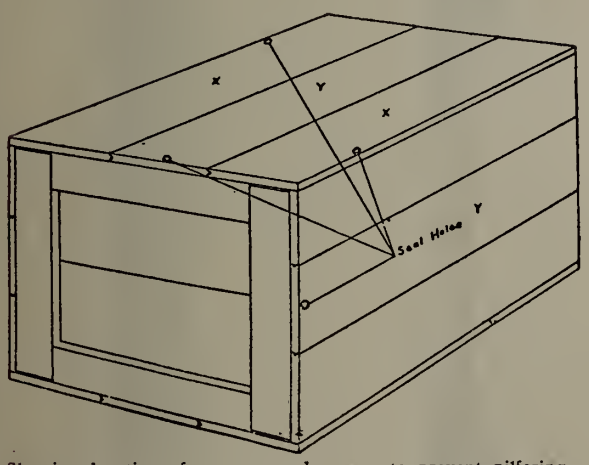
Box Designed to Prevent Pilfering

Proper Construction Discourages the Opening of Boxes During Shipment—Broken Seals Indicate that Boards Have Been Tampered with —Screws for Return Service

Many million dollars worth of goods are lost each year by pilfering both in domestic and export shipment. Of course, no wooden box can be made so strong that it cannot be broken open. A box can be so sealed, however, that it is difficult for a thief to get into it without a good deal of trouble and without it showing the effects of tampering. Well applied strapping assists greatly in preventing pilfering, although an experienced thief can often get into a strapper box and seal it up again so that it is difficult to see that it has been tampered with.

There are a number of patented safety clips on the market which are very efficient in preventing pilfering. One of the most efficient methods, however, is to use a tongue and grooved box and to seal the top, bottom and side boards of the box to the sides and ends by means of countersunk screws and sealing wax. Each separate board of the top and bottom and centre boards of the sides should be sealed, with seals located as shown in the accompanying sketch. The seal on the outside top or bottom boards "X" should be on alternate ends about 8 in. from the end of the board. The centre board "Y" should each have one seal at the end.

The seal is made as shown in the other illustration. A hole "H" is bored ¾ in. wide by 3/16 in. deep, care being taken that the hole does not break the edge of the board. A screw "S" of length equal to twice the thickness of the top, bottom or side boards of the box is then driven through the top bottom or side boards down the side or end of the box. After the screw has



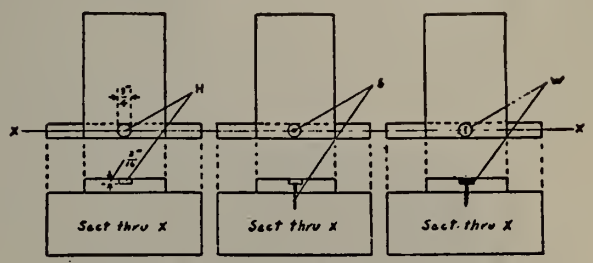
Showing location of wax covered screws to prevent pilfering

been tightly driven, hot sealing wax "W" is poured into the hole "H" so that it is about 2/3 full. While the wax is still hot it is stamped with the manufacturer's initials "I", trademark or other distinctive mark. Care should be taken not to pour the hole clear full of wax as the wax is then liable to be broken by other boxes sliding over it.

With a box sealed in this manner the top and bottom boards cannot be removed without breaking the wax seal to remove the screws after which the box would show the effects of tampering. This is the standard method of sealing used by the Munitions Board.

The Use of Screws

Where it is desired to use a box as a chest for several trips, screws are sometimes used in place of nails for attaching cleats to ends and for attaching sides, tops and bottoms to ends. To avoid splitting the first board through which the screw passes, it should al-



Showing method of drilling, sealing and waxing

ways be bored, the diameter of the hole being equal to the diameter of the shank of the screw. With the harder woods such as beech, birch and maple it is often necessary to drill the hole the full length of the screw, in which case the hole should be the same diameter as the diameter of the screw measured at the base of the thread.

The number of the gauge of the screw to be used in screwing cleats to box ends where cleats are not more than 1 inch in thickness should be No. 10, No. 11 or No. 12. The number of the gauge of screw to be used in screwing side, top and bottom boards to box ends or cleats depends upon the thickness of the material into which the screws are driven. It goes without saying that a heavy screw should never be driven into the edge of thin stock.

Apil Boxis

Vice-President Taylor, of the Multnomah Lumber & Box Co., Portland, received the following letter from a Columbia River fruit grower:

Mistur Tailour, Moult. Lum. Box. Co.

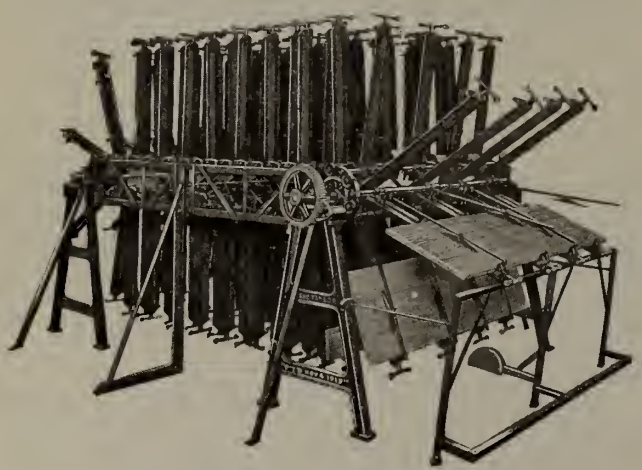
Dier Naybor: The apil boxis yu shiped me by o. w. last munth sum time ago cum duly recd. My god, is we souposed to give the o.w. feller the frait on em. When we bot them boxis for our spitzes apils yu riprecented to lie them doun to me, but they no lie, so now yu sent me quiker'n hell a receet for 4.11 monie to agint, paid him to kep apils from rotin. besides in countin boxis theys too short and my nabor says wer beet on the deel. Whars the printin on the boxis to tell whos apils they is. Does it cum extra in pacige at depo that looks two smaul and if pakige is pakige howdu yu put on the printin. Thares no nales to. hell, it takes mour monie fer hard waer stoer to put on tops with. How maney is safe in each box to keep top frum slipin off. wil shingul nales do or biger ones. Yrs. J. B.

P. Ess. When yu rite say if printin in pakige is red or blue. I like red as our apil trees don't rais blue ones.—Barrel & Box.

Machinery & Equipment

Convenient Clamp Carrier

The Taylor clamp carrier, shown in the accompanying illustration, was designed by an expert after an extended study of the requirements of equipment for edge gluing. The carrier requires very little space and accommodates more stock than can be piled in an equal floor space. A 40 section carrier with 160 to 240 clamps measures only 8 ft. 2½ in. between shaft centres and equipped with clamps opening 32 in. stands only 8 ft. high. There is plenty of room between section in use and succeeding one, so that joints can be inspected and hammered at extreme inside. The sections are far enough apart so that no



Efficient form of revolving clamp carrier

difficulty is experienced through glue dripping to the section below. No power is necessary as the carrier can easily be operated by hand.

Many advantages are provided in the clamp with which this carrier is equipped. It is composed of two pieces of angle steel placed sufficiently far apart to allow a draw bar to extend through the centre and this provides a 5 in. table which makes it possible to glue up short stock in one clamp. This feature allows the Taylor Carrier to handle double the amount of stock in a carrier, where two clamps are necessary for each piece of short stock. This clamp is exceptionally stiff and strong and draws the joints up tight. It is particularly well adapted to 3/8 in. and 1/2 in. stock, but can be used to just as good advantage on thicker stock.

Most manufacturers realize the obvious advantages to be gained by using a clamp carrier for edge gluing; there is no time lost picking up clamps and placing them in position; the motions of operators are simple and uniform. Then, too, it is a well-known fact that clamps are worn out more by abuse than by actual use. Having a clamp carrier abolishes this.

The Taylor clamp carrier has been on the market for some two or three years, but this year the company is marketing several kinds of new equipment to be used with the carrier. With this new equipment it is possible to apply veneer on the ends of stock as well as the sides at the same time and another attachment makes it possible to glue stock 6 in. thick in a clamp carrier. These articles are both very much in demand. Carrier and attachments manufactured by James L. Taylor Mfg. Co., Poughkeepsie, N. Y. A. R. Williams Machinery Co., Toronto, Canadian representatives.

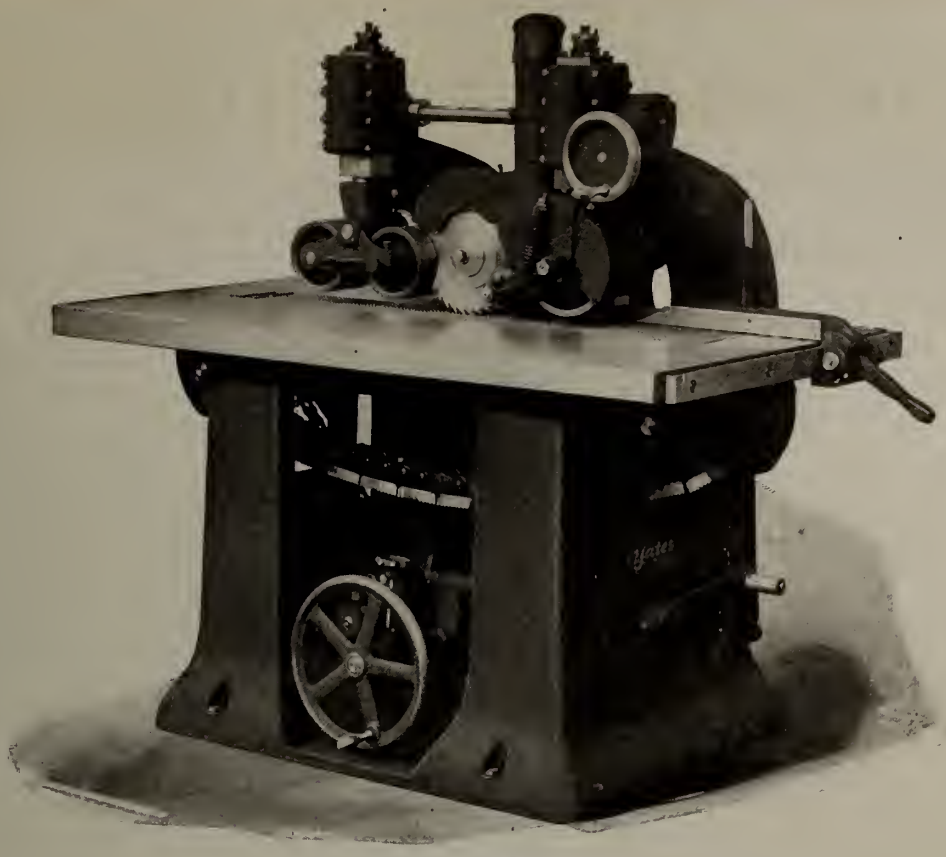
A Beltless Swing Saw

A self-contained motor driven swing saw is shown in the accompanying illustration. The motor is mounted on the lower end of column and directly connected to saw mandrel by a steel bevel gear, the saw mandrel is 1⅛ inch and is mounted in S. K. F. Ball Bearings. The steel bevel gear and the ball bearings operate in oil. The column is of channel steel, suspended from a rigid cast iron hanger of unified construction to insure rigid support and eliminate vibration. Each side arm of hanger maving a four-way adjustment, which makes for accurate alignment. The column is adjustable six inches in length to accommodate various sizes of saws.

A rocker coil spring is provided in place of the ordinary counter-balance weight to increase speed of

Motor driven beltless swing cut off saw

operation and is so designed. that as soon as the saw starts through the work, the spring is inoperative and the operator has only the resistance of the cut and the weight of machine to pull. To prevent the saw



Yates type G.2 edging and jointing saw

swinging forward too far, an automatic stop is provided.

The saw guard is of cast iron, extending completely over the top half of the saw. The handle is extra long and is so designed, in connection with the guard, that danger to the operator's hand is eliminated.

The elimination of belting and the use of ball bearings with the motor directly connected to the saw mandrel, insures increased production, accurate work, economy of operation, and safety to operator.

The machine is equipped with a 4-H. P. motor, of any voltage, 2 or 3 phase, 600 cycle current and one 16-inch circular saw. The motor speed is 3600 R.P.M. with the saw mandrel geared down to operate at a speed of 2200 R.P.M. Weight, complete, 350 pounds. Full particulars may be secured from R. O. Eaglesfield, Indianapolis, Ind.

Yates Edging and Jointing Saw

The Yates type G. 2 edging and jointing saw is shown in the accompanying illustration. Extremely accurate ripping may be done on this machine so accurate that if a smooth-cutting saw is employed the pieces may be glued up as they come from the saw without any further correction. This is accomplished by means of an endless bed which carries the stock beneath the rolls and saw. An efficient kick-back is provided in the shape of a steel bar which fits in the groove of the travelling bed and which is fastened securely at each end. This device prevents splinters and slivers falling into the groove of the moving bed, where they would likely be thrown back toward the operator. Four smooth face rolls, together with two small taper rolls, hold the stock firmly on the moving bed and prevent all swerving or side-motion. The small taper hold-down rolls are set with their axis at an angle, permitting the rolls to work very close to the saw. Sufficient motion is provided to take care of slight variations in thickness of stock, but a hand wheel, with dial, is provided to make quick adjustments for handling stock of different thicknesses. Provision is made for adjusting two halves of table to take care of wear on end of blocks. The arbor is of large diameter, 2 1/8 in., and is mounted in a yoke. Adjustments are provided so that the arbor may be kept in perfect alignment with the travelling bed. A vertical adjustment permits of different size saws being used. Three rates of feed are permitted, namely. 60, 90 and 130 feet a minute. The machine may be had for either belt or direct connected motor drive and may be changed from one to the other with very little trouble. An extension table may be had for the handling of wide stock. Another extra attachment is what is called a sizing attachment. This consists of a metal slat table which rolls back and forth on a two-rail track, attached by brackets to frame. When laying up wide stock, the pieces are laid in order on this travelling table until sufficient width has accumulated, then the whole width is sized by moving the work toward the saw as far as a screw bolt stop will allow, and sizing to width. Full particulars regarding this saw may be secured from the P. B. Yates Machine Co., Hamilton, Ont.

The electrician is employed to repair all wires and electrical equipment. If you attempt to do his work you take your life in your own hands.

When moving around the mill, always use the regular safe walkways. Short cuts are dangerous.

Upholstering and Trimming

Better Human Relations in Industry

By D. D. Fennell*

(Continued from the June number)

Mr. Gompers was somewhat displeased with the final report of the President's Industrial Conference, released to the public on March 21st, because it emphasizes the thought that employers and employees can develop most satisfactory production conditions and living conditions when the management deals directly with the men.

I wish to read to you the principal message that has come to us from that conference. This is in line with the best industrial relations practice of the day. "The guiding thought of the Conference has been that the right relationship between employer and employee can be best promoted by the deliberate organization of that relationship. That organization should begin within the plant itself. Its object should be to organize unity of interest and thus to diminish the area of conflict, and supply by organized co-operation between employers and employees the advantages of that human relationship that existed between them when industries were smallest. Such organization should provide for the joint action of managers and employees in dealing with their common interests. It should emphasize the responsibility of managers to know men at least as intimately as they know materials, and the right and duty of employees to have a knowledge of the industry, its processes and policies Employees need to understand their relation to the joint endeavor, so that they may once more have a creative interest in their work."

No modern plans for right industrial relations in a plant are possible when that plant is dominated by union leaders.

There is no particular plan for the cure of industrial ills that is applicable to all shops indiscriminately. Local conditions, character of product, past customs and habits and the personality of the management, have much to do with the determination as to how best to have maximum production under happy working and living conditions. . .

I am a great believer in the necessity for starting on the analysis of a plant by making careful study of working and wage arrangements with accurate determination of what is just to all parties concerned. The employer must ever consider that when he is receiving requests or demands from his men there are four interested factors that must receive consideration. These are Capital, Management, the Worker and the Community.

Unfortunately Labor today in its demands considers too little three of the factors and exaggerates out of all proportion the Labor factor.

Today the successful manufacturing plant is marked by business ability, wise organization, leadership that has vision and the spirit to attain it. In such a plant there is a deep-seated desire on the part of the management to bring about such loyal interest of employees in the organization that it should be to them a second home. The fullest measure of development physical, moral, mental and spiritual, of every individual in the organization through the use of the social function is the basic purpose of such management. The result:

1st. Working conditions and living conditions which make for happy and healthy workers.

2nd. A commensurate wage which is more than a living wage.

3rd. Determination to make brotherhood and fraternity a genuine realization by developing assured identity of interest throughout the plant.

4th. Appreciation of the fact that leadership in management combined with the ability of the workers can develop a solution of most of our industrial difficulties by our platform.

This Association stands for the open shop. The open shop must needs supply all of the elements that are demanded by the workers. The union offers to the man that which satisfies his social instinct; so must we put emphasis upon fellowship clubs, sports, entertainments, dances and other recreative features that have an important place in the modern plant Then in case of illness, or accident, provisions of a substantial character should be made for the worker's family in addition to the usual legal compensation. A fellowship club with mutual benefit association features is a workable and commendatory means of bringing happiness and contentment to the workers. In such plants as the management has succeeded in selling the job to the man, boards of co-operation in the general handling of labor matters have been successful in many instances, and when adaptable can well be used.

Your workmen are not looking for "welfare" work. It is well that this word be not used in connection with industrial relations. Your American workman does not want anything that has any suggestion of charity attached to it. He wants to consider things from a profitable standpoint the same as do you. It has been my experience that quite as much as he desires adequate compensation, the workman desires recognition, and the opportunity to express himself. Among all workers we find this to be true; the young man is ever looking for a chance to advance himself, to attain an ambition that has perhaps lived with him for years, while your older workers want above everything the assurance of continued employment.

The thing to do is to make of every plant an industrial family; to give to every young man in your employ a chance to express himself; to eradicate dull monotony from any of your operations by changing the work for your men occasionally where possible. Give that uncontrollable urge, which when misdirected makes for trouble, a chance to function along constructive lines. Man is a mental creature. Encouragement of your men to think brings practical, help-

ful results to you. We must open our shops. We must provide in our individual plants for the advancement of the young men. We must secure permanent employment for our older workers, and all through our organizations there must be the sort of happy conditions as will conduce to maximum production at the lowest possible cost. Let us have a genuine union of all of our own men within our own shops, and there will be little need for them to go outside for the sort of thing we can give to them within our own plants.

I desire to conclude this address by quoting to you the following paragraphs from a recent report of the Special Legislative Committee on Reconstruction of the Wisconsin Legislative:

"The heart of the world has been touched more deeply than it has ever been touched before in our time. The world is full of hope. The sentiment of the world is for better things. The social and economic reconstruction is an effort to satisfy this feeling and this longing of the world. It is a serious effort to make the world a better place to live in. These are some social facts which we have accepted as inevitable, which the new hope in the world cries out against with an insistent demand for immediate change.

"Any reconstruction movement should be based on the nineteen century old doctrine that 'men are brocation of the Christian ethics to social and economic policy. This is the road to sanity; that is the road to thers.' There must be a more thorough-going applisound reconstruction; that is progress."

Is Large Part of Lumber Wasted?

W. H. Gehm, of Indianapolis, gave a very interesting address on "Production in Furniture Factories" before the Extension Dining Tables Manufacturers' Association, in Chicago, recently. He likened a furniture factory to a twelve-storey building. The first floor was called lumber; second, glass; third, hardware and glues; fourth, finishing materials; fifth, factory labor; sixth, overhead; seventh. manufacturing; eighth, selling and administration; ninth, transportation; tenth, management; eleventh, selling value, and twelfth, profit.

In summarizing he stated that lumber stock is about 60 per cent. of normal, while values have increased about 300 per cent.; glass is very scarce and high in price; glues have advanced about 300 per cent.; the same increase holds good on finishing materials; labor costs have advanced 160 per cent; the increase in overhead amounts to 150 per cent. and the cost to manufacture has, on the whole, increased about 300 per cent. The selling value and profit are an effect of high manufacturing costs and not a cause. The first six items determine selling value of product and no decrease in furniture prices can be expected until there is a decrease in these items.

Mr. Gehm also made the startling statement that 80 per cent. of the lumber purchased is wasted in kiln drying and in process of manufacture. About half of this waste can be eliminated by proper drying and proper yard handling before going into the kiln. A large number of plants do not use up-to-date methods in their lumber yards. A saving can be effected by sticking the lumber in the yard the same as in the kiln. Until a manufacturer gets all possible out of his lumber he is not in a position to kick at lumber prices. He further stated: "I am a believer in physical culture. Most manufacturers disregard their physical development, on which depends their proper mental condition. You must be physically right for your mental need. You owe it to your self and your plant.

Marking Coverings to Advantage

The use of stencils in marking patterns on quantities of coverings for use on upholstered furniture, auto bodies and other articles requiring pieces cut to shape, will effect a saving in time and material and prove a great convenience as well.

These patterns are made on heavy brown paper, the width of material to be cut. The length of the pattern is determined by the length of the lay. The usual cardboard patterns are carefully arranged in the lay to cut with least possible waste and produce material in the number of pieces per unit or sets required. Time given to this arrangement of patterns is well spent, as there are instances in the automobile business of cutting with an average waste of only 3½ per cent and in some cases less than 1 per cent.

The patterns are drawn on the paper after the most economical arrangement has been worked out. The lines are then perforated. This perforation can best be accomplished by the use of a steel disc about 1½ inches in diameter with a saw tooth edge. The disc should revolve on an axle to which a handle has been attached. By rolling the disc over the lines on the pattern a suitable perforation can be secured.

After the lay has been built up, the stencilled pattern is placed on top, and powdered over the perforated lines with whiting or talc tied in a cloth that will permit the powder to sift through. Removal of the paper pattern will show a lay marked for cutting.

Chain Drives on Woodworking Machines

During recent years the use of the roller chain in connection with the driving elements of woodworking machinery has become immensely popular. and, perhaps, deservedly so. For one thing there is no opportunity afforded for slip when using a chain, the drive is positive, and modern made chains are the outcome of much scientific thought and experiment, hence wear is inappreciable, and the drive is a smooth and silent one.

But to minimize wear some little care needs to be exercised. If it is at all possible, a chain should be protected against flying dust and chips incidental to wood-working operations. It should also be periodically brushed, some mineral oil run into it in order to remove caked or glued-up grease, then some clean oil of good quality applied. A much better arrangement is, of course, the application of an oil bath to a running chain, or, failing this, some form of splash arrangement, or drip-feed lubricator; if the latter, then the feed should fall on the inside of the chain.

The best-designed chain drives are those that have provided some form of adjustment between the shaft centres, as with wear it becomes essential to take up superfluous slack, since an over-slack chain is apt to "whip" and this has the effect of destroying smoothness of running and strains the journals of the respective shafts.

The greatest success in chain driving is assured when the drive is as near horizontal as possible, but if an inclination of drive must be, it ought not to exceed 45 degrees. A vertical chain drive is seldom efficient for any great length of time. A drive should be as close to bearings as possible, the shafts must be parallel and lie in a horizontal plane, and all end play must be reduced to a minimum.

THE FINISHING ROOM

Securing a Fine Finish on Hard Maple

Use Light Materials to Bring Out Natural Shades —Beautiful Wood When Properly Handled

By John N. Moore

We have nearly all heard the old story about painting the lily; "you really cannot improve it," and some of our standard finishes belong in the same realm of industrial art, having reached such a degree of perfection that it is practically impossible to make them any better. Is there really anything more beautiful than some of the wonderful wood finishes to be seen on the best furniture? Even the layman has come to detect the standard from the imitation,—the cheap and shoddy from the genuine. When it comes to wood finishing there is practically only one course to pursue, "use the best." Of course, there are some cheap grades of furniture whose market will not stand the better finishes, but even then the best for the purpose can be used.

The treatment of wood, whether hard or soft, is a very interesting subject, and the process has gone through a long and steady development that has brought it to its present seemingly final state. The subject, however, is so complicated that no finisher, no matter how skilled, finds himself totally without finishing troubles, for they come even to the most experienced.

White Shellac and Light Varnish

One of the most beautiful hard woods we have today is maple, very pale in color, sometimes almost white, which demands to be filled and finished in such a way that the natural beauty of grain and color will not be interfered with. This resolves itself into a simple matter, however, as a very pale white shellac should be used, and a varnish that is almost white is all that is required for the proper filling and finishing of this beautiful wood. Should linseed oil be used it will darken the work, as it will almost any of the light colored woods. The first thing to do is to apply a thin coat of white or bleached shellac varnish, first being sure that the surface is very smooth, clean and perfectly dry.

Some finishers prefer to cut, that is to prepare the gum themselves, thinking in this way to get a better varnish than they can secure elsewhere. To those in this class it is easily accomplished by procuring the gum shellac in white or bleached form, and dissolving it in denatured grain alcohol. Many varnish manufacturers use this word "cut" when speaking of making shellac varnish; it is produced by the cutting or dissolving of the gum by the alcohol, the other common way of cutting it being with alkali. Benzol, however, also dissolves the gum quite readily.

Thin Shellac Serves the Purpose

It is wonderful how thin shellac may be used and still have a good "fill" or finish. A thin coat is practically always preferred to a heavy one. Thin shellac when applied more evenly than the heavier is less apt to show brush marks and frequently dries with none at all. Two thin coats are always better than one heavy one. It is advisable to use a glue set brush for applying varnish always. Steel wool is also better than sandpaper for smoothing the shellaced surface. One should be advised against touching up any places that may have been missed when shellacing, the suggestion is to be careful not to miss them.

Should the shellac coat turn white you may be sure that it contained some water, which upon analyzing would have been found in the alcohol. Alcohol is greedy for water. The vessel containing this fluid should always be well corked, otherwise it drinks in moisture from the atmosphere, getting weaker and weaker all the time. When the shellac turns white the work is generally ruined. By white we mean that the bleached shellac loses its natural, pale color and when a brown shellac is used it turns a pale brown or perhaps a near white, streaky color.

Some consider it very important to add a little spirits of turpentine to the shellac varnish. It is also important that you have first quality shellac for finishing white or pale maple wood. This is why we have devoted quite a few paragraphs to the best selection of gums, liquids, etc.

To Obtain a Good Body

If you want first class work, four coats of white shellac are necessary. Each coating should be rubbed down with fine steel wool, finishing with one coat of very pale or white varnish. Maple as a rule looks best finished in the full gloss, although some prefer it in the dead finish.

We find some finishers who think it is best to fill and some who prefer merely a priming coat. Shellac, however, serves as a very fine surfacer and really not as a filler as the word is usually interpreted. Maple is a fine, hard grained wood and requires no filling aside from that offered by a liquid like shellac. When several coats of this are given the need of a filler entirely disappears. A filler ordinarily being a preparation used on an open grain wood like chestnut, oak, etc. With such woods as these it will take many coats of shellac to effect proper filling, therefore, the use of a regular filler is advised, but as we are speaking of maple the principal thing is to preserve the natural beauty both as regards color and grain, nothing could be better than a shellac varnish. Sufficient coats of this and a full flowing coat of pale varnish will give you a very fine finish.

Perfect Surface Essential

In the first place the surface should be made smooth by the woodworker, and then the finisher should see that it is perfect, and if not should make it so. All grease, dirt marks of any kind, etc., should be thoroughly removed, even to the smallest suspicion of dust.

The staining process of maple is quite easy, and some very fine effects are obtained, as for instance,

a fine green made with copperas water, but the staining of maple is not, however, as a rule resorted to.

You will find that shellac is rather more difficult to rub than varnish. It also is costly just now, and certainly where the work is of such a character that good prices can be demanded, shellac should not be replaced by any substitute. White shellac fills the wood and makes an ideal surface, preserves the natural color of the wood, and does not impart any additional color to it.

Plenty of Drying Time Allowed

Be sure that the varnish coats and the several coats of shellac be given plenty of time to dry between each coat. Failure always follows rushing the work. Damar varnish, while slow and quite white, will not do for maple. It will not stand rubbing or will not take a high polish. We believe this to be too soft a varnish. One or two coats of white or pale copal varnish will produce a very fine white finish, but should have three or four days allowed between coats. If extra good work is desired the second coat should have five days for drying, after which it may be rubbed with fine pumice stone powder, water and a bit of felt. After this, wash down well with clear water, rub with chamois skin or let the work stand for a day, then polish with pulverized rotten stone, water and felt.

Do not be deceived by the shellac varnish seeming to be dry a few minutes after it is put on. It must become thoroughly hard, however. In this case two coats may be put on during one day as far apart as possible, but when you wish to give it several coats it is best to let each coat have twenty-four hours in which to become thoroughly hard.

Securing a Fine Polished Finish

Goods to be polished should first be rubbed down smooth with water and medium coarse pumice stone, using felt as a rubbing block. Plenty of water should be kept on the work, otherwise the varnish will cake on the rubbing block, and will scratch and tear the surface. The "caking" of the varnish can be detected from the "feel" of the rubbing block. This caking is more liable to take place where the varnish is not quite hard.

Where the goods to be rubbed have had three or four coats of varnish, it is well to have two grades of pumice, one grade somewhat finer than the other to finish off with. It is impossible to get a good job with one application of pumice on work that has had three or four coats of varnish, unless the varnish has had ample time to dry thoroughly hard.

The felt used for rubbing with pumice is usually about 3/8 inch thick. It is made in various degrees of firmness. a medium hard felt being the best for this work. Some factories start to cut down heavy work with burlap until the job is about half rubbed, then use the rubbing felt and finish off with a piece of thin felt. While burlap will hold the pumice better and cut quicker than the felt, it does not produce such fine work.

The fine rubbing may follow right after the first rubbing providing the varnish is hard. If not, it should be allowed to stand from 12 hours up, to "sweat" out and take on a hard surface.

The object of the fine rubbing which is done with rottenstone and water is to prepare the surface for polishing by removing all the scratches made by the pumice in the course of rubbing. From 12 to 24 hours or even longer, if necessary, should always be allowed between the fine rubbing and the polishing to insure a durable polish.

The results obtained in polishing depend on the composition of the liquid used in the process. This polish is used in connection with rottenstone in the ordinary way with a pad of very soft cotton waste. Better results will be obtained if the work to be polished is sponged, immediately before polishing, with a piece of damp (not wet) cotton waste. Polishing is not done with circular motions, but with a straight stroke extending from one end of the surface to the other.

The greatest care must be exercised in cleaning off the polish, which should be done by rubbing over the surface very lightly in a circular motion with a soft cloth moistened with a small quantity of alcohol. This will remove all traces of grease. If there is too much alcohol on the cloth, it will destroy the polish. To avoid this, sprinkle a small quantity of the alcohol on the cloth and twist it to allow the liquid to spread throughout the whole cloth.

For a satin finsh the varnish is rubbed down with water and pumice and then oiled. A duller finish is produced by rubbing the varnish with oil and pumice. If goods are heavily coated, the large flat surfaces such as tops, fronts and other prominent parts should first be water rubbed and allowed to stand for a few hours before being oil rubbed. This will prevent "pulling out."—"Finishing Facts"

Making Wood Fire Resistant With Paint

Fire retardent paints are the most practical means so far discovered by the Forest Products Laboratory by which small amounts of wood can economically be made fire resistant. The only other known methods of decreasing the inflammability of wood are to keep it wet, or to inject into it certain chemicals under pressure. These methods, though more effective than painting, are usually either impratcicable or too expensive to be considered.

Ordinary calcimine or whitewash has proved in tests to be as fire resistant as any paint covering tried. It is cheap and convenient to use . Although it will not prevent the burning of wood exposed continuously to a high heat, a good coat of calcimine on wood will decrease the danger of a blaze spreading from burning cigarettes, sparks, matches, and similar small sources of fire. Calcimine is, of course, more effective for inside than for outside use.

For exterior use numerous patented fire retardent paints are available. An effective outdoor point which has been developed at the Forest Products Laboratory, consists of linseed oil, zinc borate, and chrome green. This paint has maintained its fire-resisting properties through more than three years of exposure to the weather.

Because the old man does not move so fast as the young one, it does not prove that he will do less work. Jumping around cannot be put on an invoice, only the amount of sawn or planed wood.

Most Important Operation in Finishing Room

Sanding Plays Very Important Part—All Sharp Edges Should be Removed—Eliminating Delays in Finishing Room—Removing Varnish and Shellac Runs

By Harold Sutton

Constant supervision is the price of well-finished work and this applies more particularly to the sanding operation than, perhaps, to any other individual operation in the finishing room. It matters little what wood is used or how skillful the finisher may be if the sanding has been slighted, the finish is sure to suffer.

Sometimes proper attention to the surface to be finished and a liberal use of sandpaper, both before and in process of finishing, will result in one or several coats being saved. This is an item worth considering. Needless to say, the goods to be finished should be smooth, and what is just as important, all sharp edges should be broken or slightly rounded. If this is not done in the cabinet shop, it will pay the finisher to give it his attention and make it his duty to see that all the sharp edges are knocked off. Rounding the sharp eges slightly before staining will tend to prevent the edges being cut through when sanding after each coat. This means that the time and material required to touch up the places that have been cut through, will be saved.

Keep Work Moving Along

The time that the work is in the finishing room, undergoing the different operations, is a big item in the manufacturing process, especially when the goods are in strong demand and "rush" is the order of the day. Considering this, the finisher would be well repaid for any effort expended that would tend to hurry the work along or at least prevent delay and hold-ups. The labor or time saved will go toward increasing the output of the department.

Let us suppose that a lot of birch dressers calling for mahogany finish are being put through. The water stain has been applied, also the first coat of shellac. In sanding the shellac, the sharp edges on several of the tops were sanded through. This is not an unusual occurrence, but should be if proper precautions had been taken. The stock has now been in the finishing room from 48 to 72 hours and for all practical purposes is not any further ahead than when it first came in. This is accounted for by the fact that the edges that were cut through must be touched up with stain and allowed to dry and then touched up with shellac and allowed to dry, then sanded or rubbed down smooth before the varnish or succeeding coats may be applied.

Delay Might Have Been Longer

If the finishing operations had proceeded further along before the edges were cut through, it would mean a longer delay. Sometimes this trouble is encountered in the rubbing operation. This necessitates considerable work, for the edges must be re-stained and "frenched" or re-coated with varnish and rubbed down again. Thus it will be seen what might be saved by the simple expedient of sanding the edges before proceding with the finishing operations.

If oil stain had been employed instead of water, more skill and time would have been required to touch up the edges successfully. In touching up oil stain the danger of leaving a blotchy surface is much greater. The oil stain, unless shellaced over, will bleed through the varnish or pull off, leaving the edges lighter than the body of the piece.

Particular Attention to Water Stain

When water stain is used it is absolutely necessary to sand all surface after the stain has had time to dry and the first coat of shellac has been applied. This sanding should never be done across the grain, but always in the same direction as the grain runs. If sanded across the grain, nasty scratches will result. It is well known that water stain raises the grain of the wood, and unless these raised fibres are sanded down smooth, they will be noticeable when the piece is finished. This, in spite of the fact that the work may be pumiced and rubbed down smooth. In addition, it would require several additional coats of varnish to cover the standing grain. This means extra work, extra material and increases costs.

If any dust or grit should fall and adhere to the varnished surfaces, it must be sanded out before applying succeeding coats of varnish. If this is not done the specks may come out when rubbing, leaving small pits or pinholes. Never varnish a surface before it has been dusted. If you do, you may be troubled with pinholes through the dust pulling out when rubbing.

Removing Varnish and Shellac Runs

It is hardly necessary to mention that all runs should be worked down smooth before any other coats are applied. When sanding down shellac runs it often helps to use a little benzine. Just dip the sandpaper in the benzine before sanding. If a varnish run is being removed, dipping the paper in a mixture of one-half rubbing oil and one-half benzine will assist in the work. The oil must be rubbed off clean before any more varnish is applied.

The best sandpaper is the cheapest in the long run. It pays to buy the best, has been the experience of many successful finishers. Good paper does better work, cuts cleaner and lasts longer, and these advantages more than compensate for any slight difference in price. For the finishing room, a stock of ½, 0, 2 and 3, double-faced garnet finishing paper, would about cover all requirements. Double-faced paper is preferable to a single-faced stock, for when it is split the backing is thinner and more pliable. A good sandpaper, when bent, will retain all grit, and if two pieces are rubbed together, the grit will not come off easily. Moistening the back of paper slightly with a wet sponge will tend to prevent scratching.

Careful attention to sanding should be the rule in all finishing rooms.

A boy's cap thrown down the exhaust pipe on a machine may break a vane off the blower. It will certainly spoil the cap.

Wood kept permanently dry will last longer than that exposed to climatic conditions.

Are Present Day Finishes Too Dark?

The modern tendency seems to be towards furniture finished in the darker shades, often so dark that the natural grain of the wood is obscured or covered up. Is this a good practice? Wouldn't it be far better if the manufacturer of fine furniture were to apply a lighter finish, one that would enhance the beauty of the grain rather than smother it? By bringing out the beauty of a wood instead of obscuring it, it is more than probable that furniture from high priced stock would be in greater demand; for most people, the average buyer, admires and desires furniture from fine woods, of even texture and fancy grains. True, there are a few who prefer the darker shades, but they are in the minority and their tastes should be corrected rather than catered to.

One real, valid objection to dark finishes is that they make it an easy matter to successfully imitate the higher class cabinet woods. It is extremely difficult for the average person to distinguish between a dresser made of gum and the same piece made of real mahogany if both pieces are finished in a very dark shade. Thus, the makers of high grade lines, by applying a dark finish and thus increasing the demand for such shades, lay themselves open to the competition of the manufacturers of medium grade goods, much to the dertiment of their volume of sales.

There is a marked difference in cost and thus in selling price between a genuine mahogany dresser and the same piece in gum. Place these two pieces on the floor of some retail store and if the finish applied were such as to obscure the grain of the wood, they would both appear to be made from the same material. What is more natural than for the customer to purchase the lower-priced article. If the dealer were unscrupulous enough to say that both pieces were mahogany, it is a foregone conclusion how the sale would go.

Then again, it is said to be inartistic and a display of bad taste to show a preference for the darker finishes. If that be true, the maker of fine furniture should not place anything on the market that shows poor taste or that would tend to cultivate what might be called inartistic tastes in others.

It looks as if for self protection, if not for any other reason, the makers of high grade, well-designed lines in mahogany and walnut should strive to keep their finishes of as light in shade as possible and try to bring out the beauty of the wood, and thus to a certain extent limit the competition from the lower grade furniture.

Waterproof Qualities of Wood Finishes

Experiments have recently been made with a view to ascertaining the waterproofing properties of wood-finishing preparations. Paraffin and beeswax, followed by varnishing, did not afford protection, and coating with metals by the spraying methods was also unsatisfactory. Good results, however, were obtained by filling the wood, varnishing, coating with the liquid used for making gold size, and then applying aluminium leaf. After drying, the surface is varnished with a highly waterproof varnish. Experiments were made by coating electrolytically with copper. This makes a good resistance, but the metal does not adhere well. Good results were obtained with hard rubber (about 3 mm. thick). Good spar varnish, especially when four coats are used, gives excellent results, which are markedly improved by adding enamel, which indicates the advisability of using such enamel paints instead of plain varnish in all constructions exposed much to moisture.

Drying Periods of Various Woods

Conservative figures to use in estimating the kiln output possible with various woods are given in the following table prepared by the Forest Products Laboratory. Drying time as here given is not limited by the type of kiln, but by the physical behavior of the wood. Any dry kiln in which the circulation is adequate and the temperature and humidity are properly controlled should produce in the time specified material of high quality, free from visible degrade, if not quite equal in strength properties to air seasoned stock.

Approximate time required to kiln dry, under mild conditions, one-inch plain sawed green and partially air dry stock to moisture content of six per cent., based on weight of dry wood.

Species	Days drying time: Green from the saw	Partially air dry (25 per cent moisture content)
Swamp oak	45 to 50	20 to 25
Northern oak	30 to 40	17 to 20
Walnut, Cherry	22 to 30	13 to 15
Mahogany, Beech	16 to 22	9 to 12
Tupelo, Gum	20 to 26	10 to 14
Birch, Ash, Sycamore	15 to 21	9 to 12
Poplar, Basswood, Chestnut, Butternut, Elm, Cherry	8 to 10	4 to 6
Maple, Hickory	17 to 23	9 to 13
Conifers		
Western larch	9 to 12	4 to 6
Cypress, Redwood	10 to 18	6 to 8
Douglas fir, Yellow pine, Incense Cedar, Spruce	4 to 6	3 to 4

For stock over 1 inch and not more than 3 inches thick the drying time is proportional to the thickness. For example, 3-inch stock requires 3 times as long to dry as 1-inch stock. Quarter-sawed stock requires from 25 to 35 per cent. more time to dry than plain sawed. Drying to 10 or 14 per cent. moisture content takes from one-fourth to one-third less time than drying to 6 per cent.

S. K. F. Elect New President

At a special meeting of the Board of Directors of S K F Industries, Inc., the resignation of Mr. B. G. Prytz, as President, was accepted; Mr. Prytz having been elected managing director of the parent company, with headquarters at Gothenburg, Sweden. At the same meeting Mr. F. B. Kirkbride, vice-president since the organization of the company, was elected president to succeed Mr. Prytz.

In New Piano Action Factory

J. M. Loose & Sons, piano action manufacturers, are just getting nicely settled in their new factory on Sorauren Ave., Toronto. The new factory is a modern, well lighted, brick building with a floor space of 60,000. Considerable new equipment, in the shape of special machines, has been added, and when the plant is completely organized it is anticipated that production will be nearly double that of the old plant.

Large Sash and Door Factory in Edmonton

BIG 4

Write for sample panel showing four great Marietta Specialties, as follows:

MACO

The new principle non-fading Mahogany stain.
Has the non-fading quality of a water stain.
The non-grain-raising quality of an oil stain.
Can be filled directly over the stain like a spirit stain.

KOPALAC

"The last word in spirit Varnishes."
Has heavier gum body than shellac and holds up varnish coatings better. Can be either brushed or sprayed. Will not turn white nor fog when sprayed.
Guaranteed to contain no rosin.

SPARTAN CRACK FILLER

A non-shrinking cement for filling cracks, holes, wind checks and other defects in wood. Saves good lumber that might otherwise be wasted. Made in shades to match the stain. Dries in half an hour.

MARIETTA VARNISH

To cap the climax, the panel we send you will be finished with Marietta Varnish. A high grade article strictly up to the Marietta standard of working and wearing qualities.

FILL OUT AND RETURN COUPON.

The Marietta Paint & Color Co.

Marietta, Ohio

Southern Factory: High Point, N. C.

BIG FOUR SAMPLE COUPON

"Good workmen know the difference"

Look for this trade mark on the back of every sheet, belt or disc.

A $25.00 prize—and Joe Pocaro earned it.

"A prize of $25.00 will be given to any employee who can show a means of speeding up the work of his department.

JOHN LANG, *Superintendent.*"

Joe Pocaro, on his way to lunch one noon hour, stopped at the factory bulletin board and read this notice. Joe runs a belt-sander in the Estey Piano Company's big factory in New York City. Under the whirring sandpaper belt of his machine the hardwood panels of the piano cases receive their smooth satiny finish.

That afternoon Joe did some tall thinking as he worked. Most of the time lost in the finishing department was due to belt trouble, he decided. Breaking belt joints, even when the men made their own—grits wearing off in an hour, that should have lasted half a day—and all the other troubles that require a change of belts and eat up time.

Next day he spoke to Mr. Lang, the superintendent, "You've got a lot of sample sanding belts in your office, Mr. Lang," he said. "Will you let me have them to try out on my machine?"

Mr. Lang tells the rest of the story:

"I let Joe have all the sample belts that had accumulated in my office. In a few days he came back, with one of them in his hand. 'Mr. Lang,' he said, with a grin, 'put this belt on all the belt-sanders and I'll win your $25.00.'

"That belt was marked Manning Speed-grits," Mr. Lang continued. "I took Joe's advice and put them on all the belt-sanders. Result—I'm saving hours of time in my finishing department, and Joe Pocaro got his $25.00."

"It pays to talk over your troubles with your workmen," he concluded. *Good workmen know the difference.*"

Send for "The Difference Book"—Address

RITCHEY SUPPLY COMPANY

154 Pearl Street (*Canadian Distributors*) Toronto, Canada

Or send to Manning Abrasive Co., Troy, N. Y., U. S. A.

Manning Speed-grits

Reg. U.S. Pat. Off.

Don't say Sandpaper— say Speed-grits.

The above photograph shows the Nichols Equipment installed in the works of the Votey Organ Company, Garwood, N.J. These dryers may be used to turn out automobile bodies, furniture, pianos, talking machines, etc., in as many days as it formerly took weeks, and the finish is better, for it is dried scientifically, from the inside out.

If not already Nichols equipped, you owe it to yourself at least to investigate, because:—

1—It will easily triple the output of your finishing rooms.

2—It will decrease congestion in your factory.

3—It will decrease the investment in goods necessarily in process.

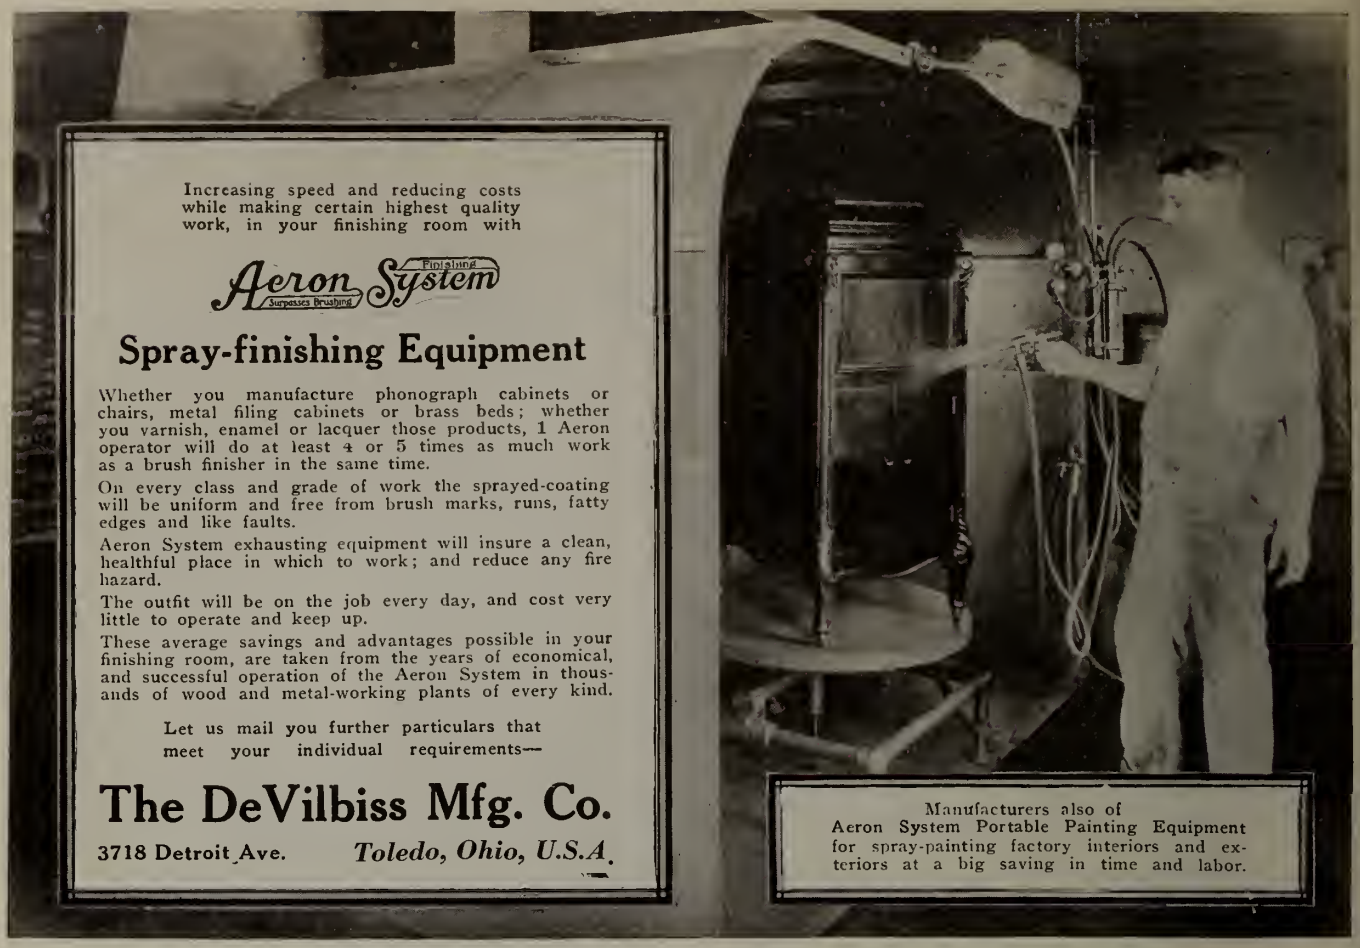
4—It will enable you to make more prompt deliveries.

We will analyze your particular conditions and then make you a proposition on an equipment that we know, from our extended experience, will save you time and money, as well as improve your product.

We guarantee fully the efficiency of the equipment as well as its mechanical construction. Every installation has been successful. There are hundreds of concerns to whom we can refer you.

A. S. NICHOLS COMPANY, 33 W. 42nd St. NEW YORK CITY

Manufacturers of Dryers for Lumber, Veneers, Glued Stock, Varnish, Paint and Enamels, for both high and low temperature work. Also sole agents for "Zenitherm" insulating material for the making of rooms for both high and low temperature drying.



Increasing speed and reducing costs while making certain highest quality work, in your finishing room with

Aeron Finishing System
Surpasses Brushing

Spray-finishing Equipment

Whether you manufacture phonograph cabinets or chairs, metal filing cabinets or brass beds; whether you varnish, enamel or lacquer those products, 1 Aeron operator will do at least 4 or 5 times as much work as a brush finisher in the same time.

On every class and grade of work the sprayed-coating will be uniform and free from brush marks, runs, fatty edges and like faults.

Aeron System exhausting equipment will insure a clean, healthful place in which to work; and reduce any fire hazard.

The outfit will be on the job every day, and cost very little to operate and keep up.

These average savings and advantages possible in your finishing room, are taken from the years of economical, and successful operation of the Aeron System in thousands of wood and metal-working plants of every kind.

Let us mail you further particulars that meet your individual requirements—

The DeVilbiss Mfg. Co.

3718 Detroit Ave. *Toledo, Ohio, U.S.A.*

Manufacturers also of
Aeron System Portable Painting Equipment
for spray-painting factory interiors and exteriors at a big saving in time and labor.

High Grade Stains and Fillers

In our Stains you will find the highest possible color values—they are positive—they are permanent. Manufactured in quantities from the best quality raw materials.

Wood Fillers also that have been tested under the most difficult of varying circumstances and found satisfactory.

Eliminate trouble in your finishing department by using these tested materials.

Veneers and Panels

Is Your Veneer Room Profitable?

Real Importance of Veneering Not Fully Realized—Department Can be Made Pay Handsome Dividends

By W. E. Clarke

It is safe to say that manufacturers are losing more money in their veneer rooms than in any other department of their factory. That this is due to wrong methods and short-sightedness goes without saying and why it should be true the writer has never been able to fathom. I have worked in many plants and visited many others so that in making this statement I feel that I am speaking with authority. Well equipped efficient glue departments, while uncommon, are often found in the most unexpected places, that is in plants where one would not look for a very high degree of efficiency. The reverse sometimes holds true and plants that are up-to-date in most departments fall down badly when it comes to the veneering room.

A case in mind is the last factory in which I worked. With one exception this plant was modern and up-to-date in every respect. Needless to say that the exception was the veneer room. If the machine shop or finishing department would benefit by the installation of a new machine, or perhaps a varnish sprayer, it was purchased and installed without the slightest hesitation. When it came to veneering they simply did not seem to see that their methods were out of date or where a few modern machines would enable them to cut down manufacturing costs and increase production.

Veneering Growing in Importance

One reason for this attitude may be that formerly veneering was only considered a side issue and as such was performed as best it could in some out of the way corner and with little or no equipment. This stage has long since been passed but the attitude of many factory owners is that of a few years ago. They must be made to realize that the use of veneers has assumed such vast proportions that this department is worthy of their best thought and attention. Not only that but in addition to the demand for veneered products, with lumber bringing such high prices the intelligent use of thin veneers can be made to pay handsome dividends.

The resawing of a board with a handsaw is no more out of place in a modern plant than the jointing of veneers and crossbanding with a hand plane and shooting board, yet the latter method is often followed. The same holds true of tacking the matched veneers on a board and attaching the tape by hand. The results secured may be entirely satisfactory but the time consumed is entirely out of proportion to the value of the operation.

Extending the Operation

No doubt many factory managers figure that their output is not large enough to warrant the expenditure necessary to install a complete line of veneering equipment. Even though they cannot keep these machines operating all the time the savings in time and material that could be effected through their use would more than pay a dividend on the money invested. In addition the demand for veneered panels for phonographs and other articles is such that little difficulty would be experienced in securing sufficient contracts to keep this department running to capacity all the time.

Take the veneer jointers that are on the market to-day. These machines are capable of making absolutely straight joints and will handle a large quantity of material in a day's run. In some of them the veneers are fed through in an almost continuous stream while in others a number of sheets are clamped in a carriage which travels past a specially fitted saw. This latter machine will make a true joint on crooked and wavy stock. By using a saw, butt and cross-grained material can be jointed without any of the short grain being torn out. This latter point should be considered when installing a veneer jointer.

Taping Machine Real Necessity

The veneer taping machine is a production machine that has hand taping skinned a thousand ways. The pieces to be taped are fed under a couple of feed rolls and the tape is applied as the work passes through. The rolls are set at a slight angle to each other, which gives them a draw that brings the veneers together tightly, ensuring a perfect joint. Various feeds are provided for and provision is made for varying the time which elapses between the applying of the glue or the moistening of the tape and the application of the tape to the veneers. Thus the tape is pressed on when the glue or mucilage is at its highest state of adhesiveness. The tape seldom if ever becomes loose.

The glue spreader is another piece of equipment that must not be overlooked. This machine will increase the productiveness of the department and by applying an even application, of just the right thickness, practically eliminate blisters and loose veneers and thus raise the quality of the product. The even application of the adhesive and the regulation of the spread tends to effect a saving in the amount of glue used. Either one or two sides of the veneers or corestock may be glued at one operation.

Other Items to Consider

A hydraulic or power press should be given consideration. This machine with a number of retaining clamps is capable of handling a large pile of panels in a nine hour shift. If the hydraulic is fitted with a pressure gauge, by a simple calculation the most suitable pressure for the different sized panels may be applied. This is an important item, one that tends for good work.

There are other items such as band saw, trim saw and a humidity controlled kiln that would contribute further to the efficiency of this department. It might

be well to spend a few hours in your veneer room studying ways and means and then investigate the merits of the different pieces of veneering equipment on the market and see if it would not increase your profits to bring this branch of your organization up-to-date.

Overcoming Warping and Checking

Manufacture of Veneered Products Often Discouraging—Faulty Work Occurs When Seemingly All Precautions are Taken—Some Items Worthy of Consideration

By W. Arthur Lynn

The managers of many woodworking plants often become quite discouraged over the results secured from their veneer departments. They employ what they consider to be the very latest methods and their equipment is supposedly up to date. None but the best grade of glue is used, and this is mixed in modern dissolvers and spread by special glue spreaders. Every precaution seemingly is taken, yet faulty work is going through continually and the results are far from satisfactory.

Usually everything runs along smoothly until the stock reaches the finishing room and is in process of finishing. Then it is noticed that certain of the veneer pieces show signs of warping and checking. Innumerable explanations and suggestions as to the probable causes of this trouble are offered by each department through which the work has passed. It generally resolves itself into a question as to whether the material used or the methods employed are at fault.

Fault Not Always in Stock

Experiments in weighing and measuring test pieces of core and veneer, together with the extraction of all moisture in a heater or oven, show the loss of weight due to the elimination of the moisture to be so small as to lead to the conclusion that the fault does not lie with the condition of the stock at the time of gluing. This leaves as the only alternative an examination of the methods employed in laying and working the veneered pieces.

Sometimes it will be noticed that when the veneers are laid flush with the core, they remain so while being laid and when in the press, this is as it should be. Again, if the material is not put under pressure quickly enough, the thin, dry veneers will absorb moisture from the glue and swell, and at some later period when the moisture is eliminated, attempt to shrink to its natural size again. The point to consider is that a certain amount of moisture is absorbed from the glue and that the amount of moisture so absorbed is controllable to a certain extent by regulating the time which elapses between the spreading of the glue and the application of pressure. Moisture, whether present in the veneers before laying or absorbed from the glue after laying, causes swelling, with a shrinkage as the stock dries. This shrinkage causes strains which often result in checks in the veneers.

Moisture the Cause of Warping

Another common trouble with ply work is that of warping. This is usually due to the moisture taken up from the glue. As this is eliminated, certain internal strains are set up, which cause the pieces to twist and warp. If the veneered stock is kept in the retaining clamps while in the warm room, the warm air will not be able to circulate between the different pieces and the centre of the stock will not be dried. This drying will then take place in the shop as the stock is being worked up and will likely cause trouble from warping and perhaps checking. The clamps should be kept on only long enough to allow the glue to set. When they are taken off, the stock should be carefully piled in the drying room, with strips between each piece, and thus take fullest advantage of the drying room instead of having the stock dry while being assembled or finished. The weight of the upper layers will usually hold the lower pieces flat, but it is best to put a few weights on the tops of the piles to secure the top pieces. If stock is held true and flat while drying and until thoroughly set it will not warp afterwards unless subjected to moisture so that swelling and shrinkage takes place again.

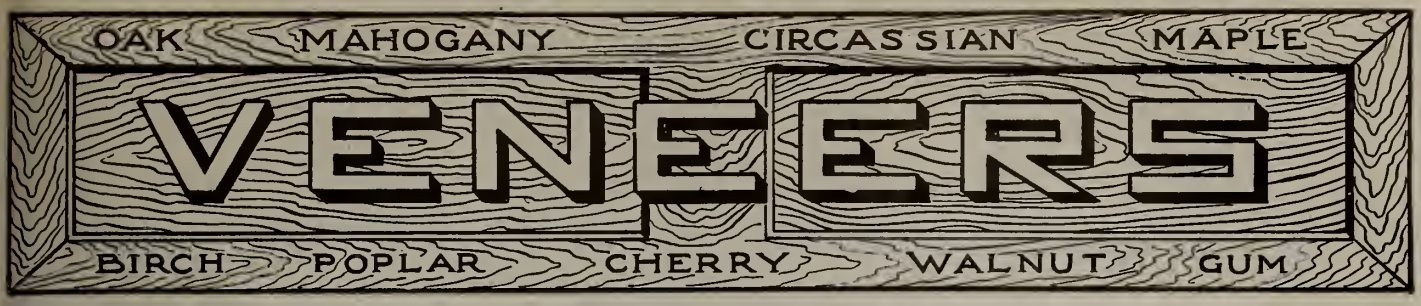
Some woods absorb glue more readily than others. One must be careful and regulate the spread and the consistency of the glue to suit the stock going through. If this is not done, loose and blistered veneers often result. If a light layer of thin glue were to be applied to woods that absorb it readily all the glue will be taken up into the pores of the wood and there will not be sufficient left to bind the pieces together. It stands to reason that when this occurs the pieces will come apart. A study of the glue absorbing qualities of the various woods used should be made and advantage taken of the knowledge thus gained when preparing glue for certain lots.

Veneer troubles can be eliminated and satisfactory results secured only by making a thorough and constant study of the different factors which, to a certain extent, are responsible for nearly all trouble—namely moisture, time, glue and pressure. Eternal vigilance is the price of good veneer work.

Effects of Oils on Glues in Plywood

Plywood may be used near machinery and tanks with little likelihood of being dangerously weakened by the action of oil or gasoline on the glue joints. This fact is evident from a test lately completed at the Forest Products Laboratory.

Plywood panels glued with animal, vegetable, blood albumin, and casein glues were immersed for nearly a year in engine oil and gasoline. At regular intervals specimens were removed from the liquids and tested for joint strength. All the glues weakened somewhat during the early part of the test, the animal and vegetable glues more than the casein and blood albumin glues. The total loss of strength in any case, however, was small enough to be negligible under most conditions of service. A glue shear strength of 100 to 125 pounds per square inch is considered sufficient for practically any purpose for which plywood is used. Only in two or three instances did the strength of the casein and blood albumin glues fall below 150 pounds per square inch. Engine oil, castor oil, and gasoline seemed to have practically the same effect on the glue joints.



THE OHIO VENEER COMPANY

Importers and Manufacturers

Foreign and Domestic Veneers and Hardwood Lumber

We always carry a large and assorted stock of Mahogany, Circassian Walnut, Sawed and Sliced Quartered Oak.

Send us your enquiries and orders. We guarantee good service.

"The Kiln Drying of Lumber"

A Practical and Theoretical Treatise

By HARRY DONALD TIEMANN, M.E., M.F.

In charge, Section of Timber Physics and Kiln Drying Experiments of the U. S. Forest Service. Special Lecturer in Wood Technology and Forestry, University of Wisconsin. Forest Products Laboratory, Madison, Wisconsin.

Second Edition 318 pages.

The value of a technical knowledge of *kiln drying* is self evident. This book, as does no other upon the market, gives the reader the most recent and most clearly expressed information. The text and illustrations guide the way to the most efficient methods of work.

CONTINUOUS SERVICE FOR TWO GENERATIONS

One of our principal competitors recently paid us the compliment of the voluntary statement that our position in the hardwood and veneer trade was the result of never varying from the traditions on which our organization was founded.

Northern Grown Oak

Fifty-two years of making and finishing the right kind of product has resulted in service of that character becoming not only a trade asset and the basis of a National reputation, but a veritable business habit. Our endeavor has for so long been to never deviate from the standards of 100 per cent. excellence as laid down by those who founded this business, that it is practically a matter of impossibility for us to vary the quality of our goods without a complete reorganization over to a high-speed, quantity basis.

American Beauty Walnut

It is recognized by the discriminating trade that our service incorporates not only goods of the highest possible excellence, but thorough understanding of the customer's requirements in order that his share of our always choice selection of goods may be precisely what he prefers.

Our knowledge of customers' needs and our ability to exactly meet those needs, recommend our service to you as a careful and experienced buyer.

The Development of Water Proof Glue

Outlining Improvements Made in Water Proof Glues—New Product Does Not Deteriorate in a Few Hours—Rolls on Spreader Turned Practically Smooth

By Lawrence Ottinger*

I know that you are thoroughly familiar with the general quality of the panels produced with waterproof glue and shall therefore confine myself to the development of these glues since the war period. Naturally these improvements were designed to adapt the waterproof glues to practical and economical commercial use, and to develop the following qualities: uniformity, low cost, convenient handling, longer life in liquid form, less absorption, after spreading, non-hydroscopic in dry form, softer dry glue line.

At the conclusion of the armistice there were three prepared casein glues in use, as well as a number of casein and blood albumin formulae. The blood albumin glues have changed little; the difficulty of getting large production with hot plate presses, cost of equipment and the care required to secure the proper temperature on the glue line, have prevented their adoption to any extent. Some work has been done which suggests the possibility of spreading the panels cold, pressing and placing the retainers in dry kilns to produce the required 180 degrees, metallic cauls carrying the heat between the panels. The process is still in its experimental stage.

The Forest Product Laboratory has recently secured patents on a combination formula of casein with blood albumen, but there seems to be no particular advantage in this formula, excepting a slight reduction in cost and, apparently, a somewhat better panel than with the blood albumen used alone.

Overcoming Certain Drawbacks

Considering the casein glues, three cardinal defects had to be overcome; first, and most important being non-uniformity, caused by the casein used in its manufacture, not only as to the quality and fat content, but also as to mesh. It must be recognized that casein is a milk product and that there are as many kinds of casein as there are different kinds of milk, and that the general composition of milk depends on the pasture and the cattle. The maker of casein glue, who is compelled to buy casein on the open market, finds it very difficult to manufacture a uniform glue. Concerns which manufacture their own casein derive their raw material regularly from the same sections of the country, and are able to obtain a uniform card. The non-uniformity which existed during the war displayed itself in various ways, such as a rapid thickening of the glue, so that in some cases it would not remain liquid for more than thirty minutes to an hour; frequent failure under the rigid government specifications and, in some cases, inability to dissolve the glue at all and get a proper working solution. A contributing cause to non-uniformity at that time was the inclusion in the formulae of hydroscopic materials, that is, materials which would absorb atmospheric moisture. One concern during the war shipped its glue in metallic containers to avoid deterioration, and still follows that practice. The solvent heretofore used almost exclusively in connection with casein has been caustic soda, and because this material absorbs atmospheric moisture glue which has been exposed in its dry form for any length of time, takes on moisture and dissolves less readily than that which had been kept thoroughly dry. When that occurs the manufacturer is tempted to add more water, securing lower adhesive strength. Solvents of a non-hydroscopic nature have since been found, so that the glue can be shipped in bags or barrels and will keep indefinitely in its dry form without fear of deterioration.

There is now obtainable from more than one source glue which is absolutely uniform and which will invariably produce a strong panel, and one which will stand the soaking or boiling test. Probably the most radical improvement, from a practical point of view, is the ability to hold the glue over night, so that it can be retained in the mixer or spreaders and the run continued the next day. This has been accomplished by the inclusion in the formula of chemicals which not only accomplish the above result but make a considerably less expensive glue taking a larger proportion of water. On panels having face veneers not thicker than 1/16 in. a spread of from 60 to 70 ft. per pound of glue is obtained and a higher spread is possible on thin veneer with smooth roll spreaders

Equipment for Mixing Glue

The equipment necessary for using casein glues is identical to that used for the vegetable glues, excepting the mixer. During the war the three-speed dough mixer was used largely, and while these are excellent machines, they are quite expensive and of such small capacity that using them in connection with large production was an expensive nuisance. Since that time we have found that any mixer having two paddles revolving in opposite directions and moving at sufficient speed will mix the glue nicely, and the glue machinery people are making special mixers for casein glues, which are practically the same as the glue cookers, excepting that the paddles are changed somewhat in form and the heating jackets omitted. These cost about half as much as the glue cookers and are of large capacity. One mixer will handle two spreaders nicely, and the spreaders may be kept going continuously. The mixer is mounted so that after the mixture has been made it is run into the tank and as many mixtures as required may be made. The usual practice in a plant consuming one thousand pounds a day is to mix five 100 pound batches in the morning and run them into the tank, and after the lunch hour mix another five batches. The mixing of a batch of casein glue, that is, prepared casein glue, requires about five minutes, and it can be run into the tank and the additional time required to dissolve, that is about ten minutes more, takes place in the tank, so that, to mix five batches of 100 pounds each consumes twenty-five minutes of actual mixing, and when the handling of the material, etc., is considered, five batches can easily be made within an hour without interfering with union regulations requiring a man to work any harder than he has to.

*United States Pulpwood Co., New York.

With these new mixers no special care is necessary in adding the glue to the water.

For eceonomy the spreaders should be turned down to a practically smooth surface, that is, just showing the pits of the corrugations, because the glue is very much more liqnid than the vegetable glues, and deep corrugations have a tendency to hold the glue and apply a heavier glue line than is necessary. Perfectly smooth spreader rolls are not desirable, because they will not grip the cores sufficiently. It will be found that when the spreader rolls are turned down, as heavy a spread as desired can be applied by manipulating the guides at the back of the rolls.

The Question of Cost

The cost of the casein glues now obtainable per glue line foot is about the same as the better vegetable glue; in other words, the cost per pound is 33 1-3 per cent. higher, and the spread per foot is about 33 1-3 per cent. greater. The cost per glue line foot of the cheaper vegetable glues is lower than can be achieved by using any of the prepared casein glues, and in discussing cost I am not taking into consideration the quality of the resultant panels. The use of a casein formula, that is, the purchase of casein, the purchase of lime and the purchase of other chemicals will produce a glue line foot nearly as cheap as can be produced with any vegetable glue. It is, however, not possible to get as good a glue by the use of any of these formulae as some of the prepared glues, the reason being that it is necessary to use a considerable volume of water to dissolve the casein separately, and it also requires a very large percentage of lime in order to rescue the casein so dissolved. The result is that the glue is not nearly as high in casein value as some of the prepared glues, and neither lime nor water have adhesive properties.

The use of a casein formula requires the attention of a man who is pretty well equipped to handle it and requires considerable attention, such as water temperature and exact weight of the ingredients and adding them at certain specified intervals. Some very large plants are willing and able to go to this trouble to save expense, and some of them have been able to produce excellent results.

Moisture Content of Stock

Thus far I have discussed cost from the glue line foot standpoint only, and without reference to other conditions which have a direct bearing on cost, such as the ability to glue up veneers with a high moisture content and the ability to take the panels out of the retainers in two and one-half to three hours. On the subject of moisture content, we must divide the panel manufacture into two classes, those which are intended for use in furniture and which are finished, and those intended for trunks, boxes, furniture backs and drawer bottoms. As far as the adhesive quality of the glue is concerned, it will hold veneers of practically any moisture content, so long as they are not rank green. Veneers which have been on the yard under normal weather conditions for forty-eight hours can be glued up without re-drying, and they will produce just as strong, if not stronger, panels than if they were re-dried to a low moisture content. The face veneers of these panels will check if the moisture content of the veneers is over 15 per cent., and will check to a greater extent according to the moisture content. On high-class work veneers containing 10 per cent. may be glued up and the face veneers will not check, particularly if the face veneers are fairly thin. It must be remembered that in glueing up a panel a considerable amount of moisture is put into it and the veneers do not abosrb as much of the moisture from the glue when they contain some moisture as do thoroughly dry veneers. From actual test, there is very little difference in the moisture content of panels after they have been glued up if they are made with veneers containing say 4 per cent. and veneers containing 10 per cent. There are, of course, a large number of variable conditions to be taken into consideration, such as the density of the wood being used, the thickness of the veneers, etc., but the statement made above as to moisture content is generally correct. A large number of plants have adopted the casein glues from a cost standpoint, taking into consideration the lack of sufficient drying facilities. Plants which make both high and low grade panels run part of their veneers through driers and part direct from the yard, increasing their production.

Panels made with a casein glue can be safely removed from retainers in 2½ hours and can immediately be trimmed without any danger of separation. This, of course, has a bearing on the most of manufacture, especially where space, equipment, retainers, etc., are limited, and it has been very difficult to obtain prompt shipment of equipment.

One other comparatively important point is in connection with the effect on cutting tools. The effect of the glue on knives depends upon the quantity and the quality of the glue, and the quantity of glue put into the panels. The lime must be of very fine mesh free of hard particles. The formulae used by most of the plants making their own glue are hard on the saws and knives, and that is also true of some of the prepared glues which contain a high percentage of unselected lime, but some of the prepared glues contain a quantity of lime so small as to be negligible. and the glues are little harder on the knives than vegetable or hide glues. In fact if panels so made are handled within twenty-four to forty-eight hours after they are glued the knives will stand up as well under casein glues as they do with the animal or vegetable or hide glues. In fact, if panels so made now using casein glues, and can testify to the fact that the knife question is one of little or no importance. Proper spreading of casein glue puts a comparatively small amount of glue between the veneers, whereas during the war it was necessary to convert a panel into a veritable cheese sandwich.

What Is Dry Rot?

The term "dry rot," the Forest Products Laboratory finds. is applied by many persons to any decay which is found in wood in a comparatively dry situation. Thus loosely used the term actually includes all decay in wood, since wood kept sufficiently wet cannot decay.

In the more limited sense in which pathologists use the term, "dry rot" applies only to the work of a certain house fungus called Merulius lachrymans. This fungus gains its distinction from the fact that it is frequently found growing in timbers without any apparent moisture supply; in reality it does not grow without moisture and is as powerless as any other fungus to infect thoroughly dry wood. Given moist wood in which to germinate, it is able to make its way a surprisingly long distance in dry timbers, drawing the water it needs from the moist wood through a conduit system of slender, minutely-porous strands.

The reception and display room of British Columbia Lumber Commissioner at 1 Adelaide St. East, Toronto, finished in B. C. fir

B. C. Woods Shown to Advantage

The new Toronto offices of the British Columbia Lumber Commissioner at No. 1 Adelaide St. East, are coming in for a lot of favorable comment. The fine panels, with which the office has been finished, show the beautiful grain of the B. C. forest products to advantage. The accompanying illustration gives an idea of the attractive appearance of this office. The tables in the foreground are made from B. C. fir and cedar. The dark panels along the wall are samples of the different B. C. wood, finished in attractive shades. The pictures, which adorn the wall, are views of the primeval B. C. forests and give the visitor a slight idea of the size to which these timbers grow.

The object of the B. C. Lumber Commissioner's office is to acquaint the Eastern wood user with the merits and worth of the different B. C. forest products. The work done is purely along educational lines, no sales of any kind being made. Information may be obtained pertaining to the timber resources of B. C., and the use, characteristics and merits of the different woods. The Toronto office is in charge of Lieut. L. L. Brown, who recntly took over his duties.

Comparative Lumber Figures

A. C. Brown, secretary of the National Association of Case Goods Manufacturers, recently sent out the following figures giving comparative lumber prices. While these quotations are based on the American market they are of interest, in that they show how each line has advanced:

A mill with every machine idle, and the engine running needlessly, denotes an indifferent foreman and a careless employer.

A good stock of cutters, which are interchangeable on every machine, is a big asset.

NICKEY BROTHERS, INC.
MEMPHIS, TENN.

N. B. Quality from Nature's Hands to You

The beginning of quality in N. B. Veneer is the hand work of nature. This condition is fostered and developed through every process of its manufacture from the felling of the tree to the beautiful, figured, smooth surface of the finished veneer.

From the discerning eye of the woodsman, through the selective hands of trained inspectors, the dexterity of skilled workmen, the precision of machinery, to the final judicial acceptance by a factory executive, your interests are guarded in the quality of this product.

The Lumber Market

Domestic Woods

The Canadian lumber industry is a trifle quiet at this writing. The American demand is not quite as strong as it was with the result that the same volume of stock is not moving. A fair amount of inquiries are being received, but there is more of a tendency to demur at the prices asked. While the prices on hardwoods have eased slightly. yet the market is remarkably firm. Birch is undoubtedly the strongest hardwood on the list, with maple a trifle weaker. The same uncertainty continues with regard to the removal of the 10 per cent. import tax on maple by the U. S. authorities, and while certain buyers have come in and picked up maple stock, no great movement is anticipated until something definite is decided on. Should the American demand ease off still further, there are signs of an awakened export trade, which, if it materializes. would absorb the stock that has been going below the dine.

Stocks of all hardwood are fairly plentiful. While still green this timber is rapidly approaching shipping condition. Few, if any, stocks are being held for speculative purposes, and it is anticipated that as the material reaches shipping condition, it will move more freely. Prices may have eased slightly but very little. Birch is firm, at the peak reached a short while ago. Maple values have lowered, due to the easing of the American demand.

The softwood situation is holding up well. There seems to be a good demand for all lines, with slow deliveries. B. C. forest products have broken slightly, but prices are on the up-grade again. Both the American and Prairie demand for B. C. woods is reviving, with the natural effect that prices are firmer, with a tendency to rise. The Coast lumbermen are very enthusiastic with regard to the prospects for the next few months. Building seems to be in full swing clear across the continent. This means that building material of all kinds is being sought after. The planing mills and sash and door factories are running to capacity and do not seem to be able to keep up with the volume of business that is offering. The box trade is brisk with the export demand increasing. It would appear that this branch of the industry is in a very healthy condition.

Taking all things into consideration the situation, with regard to Canadian woods, will likely remain firm and no marked changes need be anticipated.

Imported Woods

The situation existing with regard to American hardwoods is what might be called a state of "status quo." The demand has eased off somewhat and there have been price recessions on several lines. Prices on the whole have, however, been remarkably firm. There i. one group who look for a rapid decline in lumber values. They base their conclusion on fundamental business causes. such as the restriction of credits, high interest rates, attitude of buying public and transportation difficulties. Their reasoning seems sound. On the other hand there is the group who look for stabilized values at about the present levels. with, perahps, slight advances in certain items. They reason that the stocks of the manufacturers and wholesalers are low and depleted. The stocks held by the wood users are not any too abundant, so that the furniture manufacturer, the building material man and others must come into the market to keep their respetcive plants going. Any increase in buying activity would speedily result in a return to the conditions which have existed during the past few months. Another feature to consider is the statement that where prices have slackened, the consumer has not benefited. The wholesalers are buying up all stocks offered at reduced prices in the belief that they will realize higher prices in sixty or ninety days. The proposed increase in freight rates should bring many buyers into the field. This would have a tendency to stiffen the market. Building in the States is showing a slight improvement, which means an increased market for hardwoods. It seems to be a case where one man's judgment is as good as another's.

The Buffalo market is quiet, with manufacturers buying for immediate needs only. To a certain extent this is to be expected at this season of the year. Prices have eased somewhat but are holding firm at prevailing levels. Birch, maple and beech are in heavy demand and are among the strongest woods on the market. There has been little change on the Evansville market. Orders and inquiries are coming in at a satisfactory rate. Stocks are still low and are not being replenished. As long as this condition holds, prices are expected to remain firm, with, if anything, an upward tendency. Quartered and plain white oak are being eagerly sought after, and many firms have been unable to secure their requirements in this wood. The situation in the Southern producing centres is slowly improving and production is increasing, but it will be many months before the effects of the unfavorable weather will disappear and conditions return to normal.

Louisville rejorts trade as being slack. This is due to the opinion of certain buyers that prices will recede in the near future. This view is not held by the manufacturer and jobber. If the decline comes it will be slow and gradual and in conjunction with labor and other commodities. The demand for oak, both quartered and plain, shows a slight improvement. The car situation has changed slightly and shipments are going forward.

Traffic conditions are giving lumber manufacturers considerable concern, for with a shortage at present they figure that this will become more acute shortly when the wheat commences to move.

It would look as if it would be the part of wisdom for a manufacturer to keep his lumber stock up rather than allow it to run low.

Well Known Veneer Man Passes Away

W. T. Thompson, president of the W. T. Thompson Veneer Co., of Edinburgh, Indiana, passed away at his home June 26th after a brief illness of one week. He attended the Lumbermen's Convention at Chicago the week before and while there contracted a cold which, developing into pneumonia, caused his death.

Mr. Thompson was a well known veneer manufacturer, president of the Farmers' National Bank of Edinburgh and a thirty-second degree Mason. He was highly esteemed in business and social circles and his demise cause a gloom over the community.

Information and Inquiries

You are cordially invited to make use of this department

Mont Joli, Que., June 29/20

Editor "Canadian Woodworker"

Can you tell me where I can secure a brass hand rail for a stairway?

Yours truly, Oct. Bertin.

The Beaver Brass Mfg. Co., 23 Ryerson Ave., Toronto, make brass hand rails. If you write them direct they will gladly quote on your requirements.

Woodwork for Sewing Machines

A firm in Manchester, England, wish to procure quantities of woodwork used in the manufacture of sewing machine platforms. Three separate pieces are required, consisting of single-piece platforms, drop leaf, and a built-up platform.

The single piece platform is made of hardwood, 16½ by 30 inches, almost 1 inch in thickness, bevelled edge, polished top, slotted 6⅞ by 10⅞ inches, bored with two ¾-inch holes and two ⅝-inch holes. Three slots mortised in under side for hinges to drop leaf. The drop leaf is made of hardwood, 10½ by 16½, with bevelled edge and polished top.

The built-up platform consists of seven pieces, with single-piece hardwood top and four-piece, dovetailed base. Softwood shook tacked to bottom of platform and softwood crosspiece glued to base, between the slots of the top. Platform 10½ by 19 inches over all, with bevelled edge and polished top. Slotted for machine 6⅞ by 11⅝ inches and for drawer in top, with curved end, 2⅜ by 9 inches. Top bored with three ⅝-inch holes. Name of firm enquiring may be secured by writing the publishers of the "Canadian Woodworker."

Equipment Required

St. Pie, P. Q., July 5, 1920.

Editor, "Canadian Woodworker."

Will you kindly tell me the kind of machine, with the name of the manufacturer, that is required for making the shoe shanks which were illustrated in the April issue of your paper. I expect to be in the market for several of these machines. Will be very grateful for any information you furnish.

Yours truly L. P. Beaudry.

It is doubtful if such a machine is on the market. As near as we can ascertain, those who are engaged in manufacturing shoe shanks are using equipment of their own design or made especially to their order.

Built up platform

Single piece with drop leaf

May We Make This Suggestion?

To those buyers whose requirements of hardwood lumber, rotary veneers and panels it has been our privilege to serve and to those others who we hope to serve in the future, we would like to frankly and in friendliness advise that bad as the car situation is to-day, it is bound to be infinitely worse in a month or two. Therefore, to insure delivery and avoid the 30 or 40 per cent. increase in freight rates, due about September first, we earnestly counsel buying now.

May we suggest also that our friends should not reckon too strongly on much lower prices? It is true that the present tendency is downward, but while the southern forests are now pretty well dried out, the almost total impossibility of getting cars is keeping millions of feet of logs in the woods, where vast quantities are rapidly deteriorating. A goodly portion of this accumulation probably never will reach the saw mills. Thus, while one adverse condition is out of the way, another immediately takes its place, and though southern manufacturers have succeeded in making one spurt in production, the average mill stock in the south is still dangerously low. The consequence of such condition has been brought home with force to buyers in the past eighteen months.

This is but a friendly suggestion offered only because we think it absolutely true. Therefore, if you possibly can, buy now. As to price, our only assurance is that now as always, our policy is to give full value for every dollar invested with us.

SOUTHERN
HARDWOODS

News of the Trade

The Pioneer Auto & Carriage Works, Vancouver, B. C., are constructing a factory at a cost of $10,000.

The O'Neil, Irvine & Mann Lumber Co., Boulder Creek, B. C., recently completed a new saw and planing mill.

Cameron & Campbell, Toronto, Ont, general woodworkers, are erecting a small addition to their factory.

The assets of Duchesne & Grimard, Limited, Montreal, Que., manufacturers of phonographs, have been disposed of.

Wilder & Hutchinson have leased the old Waddell furniture factory in Orono, Ont., and are converting it into a flax mill.

Recent Montreal registrations include Lamer & Debien, carriage manufacturers, and the Standard Broom & Brush Co., Limited.

Wm. Smedley, Toronto, Ont., manufacturer of antique and special furniture, is building an addition to his store at a cost of $1,500.

J. M. Loose & Sons, Toronto, manufacturers of piano actions and keys, have moved from Carlaw Ave. to their new factory on Sorauren Ave.

A shook mill and power house is being constructed at Port Elgin, N. B., by Fred Magee. The cost will be in the neighborhood of $18,000.

Dominion Boxes, Limited, Ottawa, Ont., was recently authorized by supplementary letters patent to change their name to Premier Boxes, Limited.

Schultz Bros, Brantford, Ont., manufacturers of portable houses and various forms of wood products, are building a small addition to their offices at a cost of $1,000.

Stirett's Planing Mill at Port Arthur, Ont, was recently closed down for a few days owing to damage to the electrical equipment which occurred during a severe storm

The Home Appliance Mfg Co, Limited, Winnipeg, Man., has been incorporated to manufacture and deal in washing machines and electrical devices. Capital $250,000.

The Pellerin Pelton Music Co., Limited, Ottawa, Ont, have been authorized by supplementry letter patent to change their name to Pellerin Music Co, Limited.

Aime Ally, Grand Mere, P. Q, is erecting a saw and planing mill. The building will be 1½ storeys high, 80 x 30, and of brick and frame construction. Cost $12,000.

Simmons, Ltd., of Montreal, Que., have taken out a provincial charter, authorizing them to do business in Ontario, provided they do not use a capital in excess of $300,000.

The Veterans Mfg. & Supply Co, Ltd., Toronto, Ont., manufacturers of reed and rattan furniture, have moved their plant from 54 Noble St. to larger premises on Front St. East.

The Stansell Motors, Amherstburg, Ont, consider erecting a new factory for manufacturing auto bodies. A certain amount of stock will be placed on the market to finance this new project.

Ham Bros. Co, Limited, Brantford, Ont., have let a contract for two Sidman lumber curing kilns. These are to be erected in connection with the new factory which is being constructed.

There have been a few changes in the firm of H. Mathieu & Co., who conduct a sash and door factory at Montreal. Wilfred H. Pauze and Eugene Mathieu are now the registered proprietors.

Slight damage was done to the plant of the Canadian Woodworking Co., Yarmouth, N. S., by fire recently. The blaze was extinguished, however, before it had made very much headway.

The Sellers Kitchen Cabinet Co of Canada, Limited, has been granted an Ontario charter, permitting them to do business in the province provided they do not employ a capital in excess of $60,000.

The Sidmans of Canada, lumber curing specialists, recently shipped material for four Sidman kilns to Shanghai, China. A number of these kilns are being operated in India and other foreign countries.

A large part of the plant of the John Watson Mfg. Co., Ayr, Ont., was destroyed by fire. The loss, which amounts to $150,000, was only partly covered by insurance. This firm manufacturers a line of factory trucks in addition to other products. No definite decision has been made with regard to rebuilding.

The Snyder Furnituer Co., Limited, of Elmira, Ont., are constructing three Sidman lumber curing kilns and are rearranging their yard so as to handle their lumber more economically and with less labor.

The Comfort Mfg. Co., Toronto, who manufacture a line of stuff-over chairs and settees, have moved from Jarvis St. to 645 King St. W. They have installed a small plant and manufacture their own frames.

The Continental Match Co., Limited, have been incorporated to manufacture and deal in matches. Capital $250,000. Among the incorporators are J. R. Roaf and J. Creighton, solicitors, both of Toronto.

Construction has been commenced on the new plant of the Oakville Basket & Veneering Co. This new building will be three storeys, 200 x 32 ft. It is understood that about $75,000 will be spent in purchasing equipment.

Hogue, Limited, Montreal, Que., have been incorporated to manufacture and deal in boxes and all kinds of wood products. Capital $49,000. Among the incorporators are J. H. Dorion, and R. H. Beaulieu, both of Montreal.

The directors of the newly-formed Stratford Housing Co., Limited, Stratford, Ont., include D. M. Wright, W. J. Anderson, H. W. Strudley, W. H. Salter. The majority of these gentlemen are prominent furniture manufacturers.

The Cyrano Cabinet Co. of Canada, Limited, have been incorporated to manufacture and deal in toys, pictures, and all kinds of wood novelties. Capital $100,000. E. Sylvestre and F. R. Darche, both of Sherbrooke, Que, are two of the incorporators.

Leyland Motors, Limited, Toronto, Ont., was recently granted a provincial charter to manufacture and deal in motor car bodies, carriages, wheels and other wooden vehicles. The attorney appointed by the new company is W. E. Humphreys, of Toronto, Ont.

Dunn's Auto Markers, Limited, Montreal, Que, have been incorporated to manufacture and deal in automobiles, aeroplanes, boats and other vehicles. Capital $1,000,000. Two of the incorporators are C. Sinclair and S. G. Dixon, advocates, both of Montreal.

W. J. Bear, of Toronto, is erecting a three-storey furniture factory, 135 x 24, and installing new equipment. Mr Bear confines his line almost entirely to the manufacture of antique furniture. The new factory will cost between $40,000 and $50,000.

The town of St. Quentin, N. B, was partially destroyed by fire and the following woodworkers suffered heavy damages: Chas. Roy & Co., sash and door factory; Arthur Isabelle, carriage manufacturer; E. C. Frost and J. E. Michaud, saw and planing mills.

The Hamilton Wirebound Box Co., Ltd., Hamilton, Ont, were recently incorporated to manufacture and deal in boxes and other containers. Capital $40,000. G. W. Ballard and W. Morrison, barristers, both of Hamilton, Ont, are two of the incorporators.

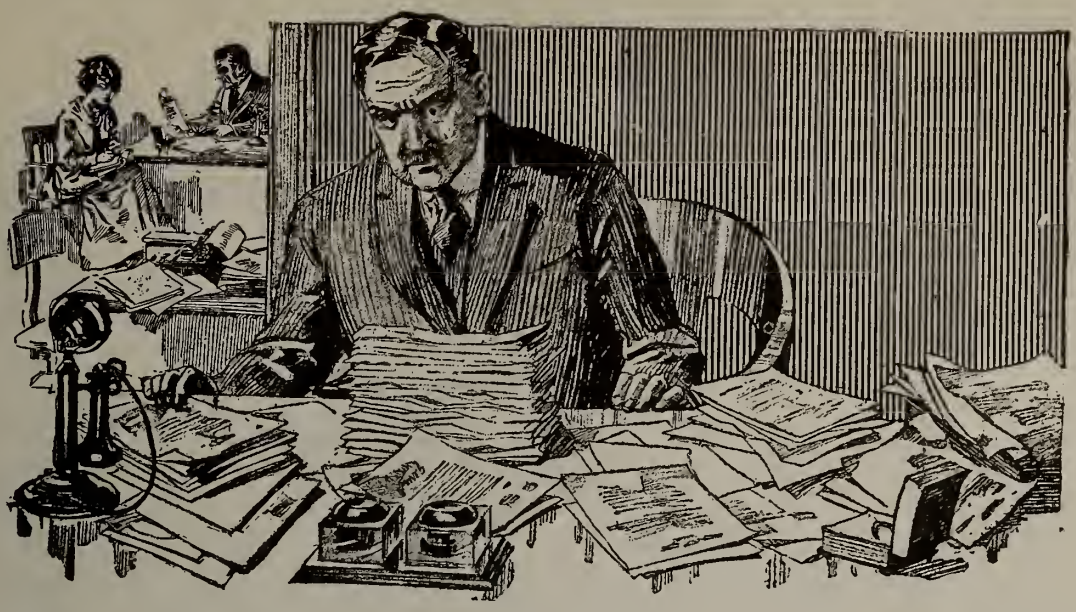
L. C. Barbeau & Co., Limitee, Montreal, Que, were recently granted a provincial charter to manufacture motorboats, aeroplanes and other wooden vehicles. Capital $49,900. L. C. Barbeau and L. E. Seguin, both of Montreal, are two of the incorporators.

The Cornfield Wheel Co, Limited, Toronto, Ont., was recently incorporated to manufacture and deal in motor trucks, wheels and bodies. Capital $150,000. Two of the incorporators are G. M. Huyke and N. E. Strickland, barristers, both of Toronto, Ont.

The Columbia Handle Co., London, Ont., have commenced work on an addition to their factory. They are in the market for special machinery for manufacturing handles and other wood products The cost of the new plant will be in the neighborhood of $25,000.

The W. B. Jennings Co, Ltd., St. Thomas, Ont., have been granted a provincial charter to manufacture and deal in furniture, musical instruments and other wood products. Capital $40,000. Two of the incorporators are W. A. Jennings and H. B. Jennings, both of St. Thomas, Ont.

C. Alf. Gingras & Sons, Limited, who were recently granted a provincial charter to operate sawmills, manufacture lumber, timber, etc, with a capital stock of $45,000, and headquarters at Sherbrooke, Que., have recently moved their plant to larger and more commodious quarters. The new



Trying to Find the Leak in His Profits

(*We could tell him where it is*)

Yes—we could put our finger on it first shot. Years of experience in time recording problems have shown us that there is one big leak-point and few employers grasp it. The difference between the total labor time you pay for and the productive labor time that is actually delivered by the work people. There is the danger spot.

company will manufacture all kinds of fixtures, such as those for churches, banks, stores and offices. The firm will also supply contractors with all the material they may require. L. E. Gingras is general manager of the organization.

The British Columbia Spruce Mills, Limited, Wattsburg, B. C., which was recently incorporated with a capital of $1,000,000, are actively engaged in the construction of a large saw and planing mill. It is said that the planing mill will be one of the largest in the interior of B. C.

The Q. R. S. Music Co., Limited, Toronto, Ont, were recently granted a provincial charter to manufacture and deal in pianos, phonographs and other musical instruments. Capital $150,000. H. J. Stuart and M. Aylesworth, barristers, both of Toronto, Ont., are among the incorporators.

The Beaver Motor Truck Corporation, Limited, Hamilton, Ont, have been incorporated to manufacture and deal in motor trucks, boats, aeroplanes and conveyances of all kinds. Capital $1,000,000. Among the incorporators are H. R. Williams and A. P. Goering, both of Hamilton, Ont.

The strike of the Ottawa inside woodworkers, which has partially tied up many of the woodworking plants in that city, was further aggravated by a walk-out of about 250 laborers and teamsters employed in these plants. The laborers and teamsters are demanding a minimum rate of 55c an hour.

Riviere du Loup Excelsior Co., Limited, Riviere du Loup, Que, were recently incorporated to manufacture and deal in excelsior wood fibre, to operate mills and manufacture all kinds of woodenwork. Capital $20,000. J. H. Mailloux and H. Desrosiers, both of Riviere du Loup, are two of the incorporators.

Tremblay, Denis & Compagnie, Limited, Saint Raymond, Que., have been granted a provincial charter to conduct a business as general woodworkers, manufacturing cabinets and other woodenware. Capital $100,000. Two of the incorporators are J. Tremblay and J. Denis, both of Saint Raymond, Que.

Among the firms recently incorporated in British Columbia might be mentioned the Canadian Western Door Co., Limited, Vancouver, B. C., capital $10,000; the Northwestern Box Co., Limited, Vancouver, B. C., capital $10,000; and the Wallace Shipbuilding & Drydock Co., Limited, Vancouver, B. C, capital $1,000,000.

An acute shortage of berry boxes is interfering with the marketting of the strawberry crop in Ontario. One reason for the scarcity of these boxes is the destruction by fire of the plant of the Oakville Basket & Veneer Co, Oakville, Ont. This firm was one of the largest manufacturers of this class of boxes in Canada.

The plant of the Peterboro Canoe Co., Peterboro, Ont., was damaged by fire to the extent of $3,000. The loss is covered by insurance. The fire started in the dry kilns. The fire walls, which surrounded this structure, probably saved the entire plant from destruction. The operation of the plant was not interfered with.

The Standard Fruit Basket Co. of Thorold, Ont., have taken over the basket factory of George Williams and are making changes and installing equipment to convert it to their needs. The new plant will be in operation in about ten days and will have a production of from 3,000 to 4,000 baskets a day. About 10 hands will be employed.

Woeler, Bolduc & Co., Limited, Waterloo, Ont., manufacturers of upholstered furniture, have opened permanent showrooms on the third floor of the Weiler Building, Montreal. A. T. Edwards will be in charge of the Montreal warehouse. Mr. Edwards is well known to the eastern trade, having covered that territory for many years.

The following Owen Sound firms have contracted for electric power and are installing the necessary motors: North American Furniture Co., Limited, 240 h.p.; Owen Sound Chair Co, Limited, 160 h.p.; National Table Co., Limited, 110 h.p.; H. H. Bowman (match factory), 125 h.p.; Keenan Woodenware Co., Limited, 50 h.p. (partial installation).

Frank Stanley, Toronto, piano manufacturer, has taken over the building on Carlaw Ave., formerly occupied by J. M. Loose & Sons, and is adapting it to the manufacture of pianos. A few changes are being made and a certain amount of new equipment will be installed. It is expected that this plant will be in operation toward the latter part of July.

In connection with the block which the Karn Piano Co., of Woodstock, Ont., are remodelling as apartments for their employees, it has been decided to heat these flats from the central heating plant at the factory. This will do away with all furnaces and will not necessitate the employment of a janitor. The amount of rent to be charged for these apartments has not been decided on but it is anticipated that they will be very reasonable, and the fact that they are within a few minutes' walk of the factory, should prove to be an added attraction to the workmen.

The majority of the employees of the North American Furniture Co., the Owen Sound Chair Co. and the National Table Co. went out on strike recently in an endeavor to secure an increase in wages. The men are asking for 10 per cent more for those drawing over $4 00 per day, and an increase of 15 per cent. in the wages of those earning less than the above amount. A settlement has been effected.

The Annapolis Hardwood Co., Annapolis Royal, N. S., recently opened up a plant to work up applewood. Applewood logs of all sizes and shapes have been bought up all over the country and are being worked up into saw and tool handles. A large part of the product goes to Disston & Co., the well-known saw manufacturers of Philadelphia T. H. Fortiter and E. E. Amey are behind the new enterprise.

A. E. Guidal, Limited, has been granted a charter with a capital stock of $100,000 and headquarters in Toronto. The company is empowered to manufacture and deal in all kinds of furniture, pictures, picture frames, mouldings, etc., and to carry on the business of cabinet makers, woodworkers and woodcarvers, and manufactured woodwork of all kinds. A E. Guidal, Tyrell Bldg, Toronto, is one of the incorporators.

At the annual meeting of Edward Clark & Sons, wholesale lumber dealers, Toronto, Edward Clark was re-elected president and A. E. Clark, who has been managing-director, was also elected vice-president. W. A. Walker, who has been associated with the firm for the past three years, was elected a director and appointed secretary-treasurer of the company. This firm handles hardwoods on an extensive scale and specialize particularly in birch.

Prior to his departure for eastern Canada to take over his new work as lumber commissioner for British Columbia, Loren L Brown, late superintendent in charge of the Dominion Forest Products Laboratory, Vancouver, B. C., was tendered a dinner by the B. C. branch of the Engineering Institute of Canada. During the evening Mr. Brown was presented with a suitably-engraved cigarette case, Mr. H L. Robertson making the presentation.

It is reported that the plans have been completed, subject to ratification of the shareholders, for the carrying on of the Pretolia Wagon Works, Limited, by a large corporation. The name of the new company has not not been given out but it is stated that it has some millions of capital behind it. If the deal goes through, it is the intention to manufacture wagons and sleighs on a large scale, and employment will be given to a large number of men. Full particulars will be available at an early date.

According to a Vancouver paper, when G. A. Schreiter, of the DeLuxe Upholstering Co., Limited, Kitchener, Ont., was in Vancouver, attending the convention of the Canadian Manufacturers' Association, held there recently, he made a complete survey of the province with a view to establishing a furniture factory there. He considers that Vancouver offers many advantages for manufacturing. Should Mr. Schreiter establish a branch in Vancouver, it is possible that his son will be placed in charge.

The Canadian Industrial Alcohol Co. of Corbyville, Ont. successors to the Corby Distillery Co., are manufacturing industrial alcohol on a large scale. Whereas formerly the output of the distillery was 3000 gallons of liquor per day, it is now turning out alcohol at the rate of 20,000 gallons daily. At present this is being made from molasses imported from Cuba. There are unlimited possibilities for this alcohol both in manufacturing and as a fuel for internal combustion engines to take the place of the diminishing supply of gasoline.

No settlement has been reached in the strikes of the Ottawa inside woodworkers. The employers have intimated a willingness to treat with the men as individuals, but at a mass meeting of the men, it was agreed to treat with the employees only as a union and not as individuals; thus a state of deadlock seems to have been reached In the meantime the building trade is being faced with a shortage of building material, and if a solution is not reached very shortly, some of the work under construction will be tied up. It is understood that contracts for woodwork have been let to outside firms.

Fred Magee, Limited, Port Elgin, N. B., packers and exporters, are erecting a box and shook mill. The new factory will be 36 x 84, two storeys, and will be equipped with the

HARDWOOD LUMBER

usual box-making machinery including cut-off saws, resaws, double and single planers, matchers, nailing machines, etc. Some of this equipment was purchased from Cowan & Co., of Galt, Ont. The capacity of the new plant is such that it will not only be able to take care of the requirements of the above-mentioned firm but will be able to cater to the outside demand. Manufacturing operations are expected to commence about October 1st.

According to an announcement recently made, the Sterling Caskets, Limited, Toronto, Ont., notice of incorporation of which was published in the June "Canadian Woodworker," are to take over the plant and assets of the New Dominion Casket Co., of Guelph, Ont. The plant will be moved to the building on McDonnell Square, Toronto, which was purchased by H. R. Wansbrough, who is connected with both companies. The Toronto plant is expected to be in operation at an early date and in the meantime the Guelph plant will be running to capacity. This move is due to the fact that the New Dominion Casket Co., of Guelph, found it utterly impossible to take care of the volume of business offered. Mr. Wansbrough will manage the new concern.

Personal

Arthur Craig, of Firstbrook Bros, Limited, Toronto, recently returned from a trip to Calgary.

Walter Evel, of Evel & Co., Hamilton, Ont, casket manufacturers, recently returned from a trip to Great Britain.

Fred M. Thompson, of Robert Bury & Co., Toronto, wholesale lumber dealers, recently spent an enjoyable two weeks' holiday in New York.

J. M. Arnold, formerly proprietor of the New Dominion Casket Co, Guelph, Ont., will superintend the manufacturing operations of the Sterling Caskets Limited, Toronto.

Wm. Marshall, of the Garlock-Walker Machinery Co., Limited, Toronto, left recently on an extended business trip to the Maritime Provinces. He will be away about six weeks and will cover the territory as far east as Sydney, N. B.

J. A. Minchner, manager of the North American Furniture Co., Limited, Owen Sound, Ont, is spending a couple of weeks in Grand Rapids and Chicago. While away, he will visit the furniture exhibitions which are being held in those cities.

D. M. Wright, of McLagan Furniture Co., Limited, Stratford, and C. A. McMurty, of the Gold Medal Furniture Co, Toronto, were among the manufacturers who gathered in Ottawa to protest against the high luxury tax it was proposed to levy on phonographs.

A. Robertson, of the Robertson & Hackett Sawmills, Ltd., Vancouver, B. C., who conduct a large sash and door factory in connection with their sawmill, was recently elected chairman of the newly-formed Woodworkers' Section of the B. C. Manufacturers' Association.

J. H. Baetz, of the Baetz Bros. Furniture Co, Kitchener, Ont., and H. M. Snyder, of the Snyder Bros. Upholstering Co, Limited, Waterloo, Ont., were elected chairman and vice-chairman respectively of the newly-formed Kitchener and Waterloo branch of the Canadian Manufacturers' Association.

Walter C. Palmer has joined the sales organization of the Frank A. Conkling Co., Memphis, Tenn., manufacturers of southern hardwoods. Mr. Palmer, who will represent this firm in Michigan, Ohio, and Indiana, will make his headquarters at Indianapolis, Ind., and will call personally on the trade in his territory. He has been actively connected with the hardwood lumber industry for the past twenty years and has a wide acquainance among the consuming people.

Obituary

We regret to announce the death of Mr. C. Mattison, the esteemed founder and president of the Mattison Machine Works, Rockford, Ill. His sterling character in business and private life had gained the respect and confidence of all with whom he came in contact. His demise will be felt keenly by a wide circle of friends and business associates.

Before the fan system of removing chips and dust was known, endless chains and canvas belts were used with considerable success.

Value of Timber from Live and Dead Trees

Prejudice exists in certain quarters against the use of timber cut from dead trees, and some purchase specifications insist that only timber cut from live trees will be acceptable. As a matter of fact when sound dead trees are sawed into lumber, and the weathered or charred outside is cut away, there is no method known to the Forest Products Laboratory by which the lumber can be distinguished from that cut from live trees, except that the lumber from dead trees may be partly seasoned when sawed.

All the information available at the laboratory indicates that timber cut from insect or fire killed trees is just as good for any structural purpose as that cut from live trees of similar quality, providing the wood has not been subsequently injured by decay or further insect attack. If a tree stands on the stump too long after it is killed, the sapwood is likely to become decayed or badly infested by wood-boring insects; and in time the heart-wood also will be similarly affected. The same thing is true of logs cut from live trees and not properly cared for. Until the wood becomes affected by these destructive agents, dead tree wood should be just as strong and just as durable as sound live tree wood.

In considering the subject it may be useful to remember that the heartwood of a living tree is entirely dead, and in the sapwood only a comparatively few cells are living. Most of the wood cut from trees is dead, therefore, regardless of whether the tree itself is living or not. Such being the case, purchase specifications, instead of providing that material must not be from dead trees, should state that material showing evidence of decay or insect infestation exceeding a specified limit will not be accepted.

7-9 Montreal, Que.

Trees on the Prairies

It was in 1901 that the Forestry Branch of the Department of the Interior began to send out trees to the farmers in the prairie provinces to plant shelter-belts about their buildings and fields. Since that time over five million seedlings and cuttings have been sent out from the Dominion Forestry Nursery Station at Indian Head, and the branch nursery recently established near Saskatoon. The success of this plan of free distribution of trees is shown not only in the increasing use made of it by farmers of the prairie provinces, but also by the fact that this system of free distribution has been copied either as it stands or in a modified form by other important administrative bodies. The provinces of Ontario and Quebec, although their conditions are very different from those of the prairie provinces, have applied the plan in a modified form to farmers' wood-lots. The United States Department of Agriculture, after a careful study of the system in Canada, applied it to the prairie states. At present several thousand farmers in the Canadian west are receiving trees annually and this number doubtless now will be increased seeing that the war is over, and the farmers have more time.

SPARE PLATFORMS NESTED
THE LOAD
GETTING UNDER THE LOAD
ELEVATING THE LOAD SINGLE LIFT
MOVING LOAD NO REHANDLING
DROPPING LOAD IN NEW LOCATION
OFF FOR NEXT LOAD
THE COWAN TRANSVEYOR SYSTEM — IT REVOLUTIONIZED FACTORY TRANSPORTATION

INSIDE ITEMS

Little notes of interest to users and prospective users of lift trucking and "skid" erection or storage.

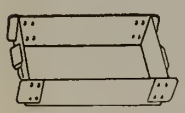
A PLATFORM KINK

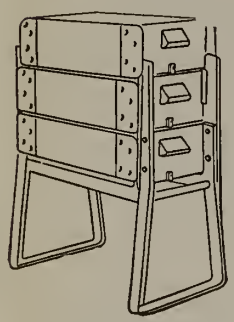
IF your full size platforms are 66 x 30, make up some 33 x 30. Two of the small skids may be transveyed at one time, bearing one load; or different loads on the two platforms may be delivered to different destinations.

EASY TO HANDLE

CONGESTED storage space and car loading often makes it difficult to use a truck to handle in an extended position. It is worth remembering that the Transveyor can be packed with the handle upright, and perfect control of the loads till maintained.

METAL TOTE BOX RACKS





THERE is no difficulty in handling piles of heavily loaded tote boxes on ordinary wooden Transveyor platforms. Sometimes, however, it is necessary to leave boxes and contents in a blueing, baking or annealing oven. In such cases, a special metal base is used, along the lines of the illustration shown herewith.

SOMETHING IN A NAME

KODAKS are cameras, but all snapshotters are not Kodaks. Vaseline is petroleum jelly, but all petroleum jelly is not Vaseline. The list might be prolonged, but would only lead to this,—Transveyors are lift trucks, but only Cowan lift trucks are Transveyors.

SOWING THE SEED

IT is decidedly interesting to watch the rapid development of the Transveyor idea in unusual places. A seed and plant company informs us that the Transveyor is saving them $200 per month by reducing the number of men necessary for moving heavy bags of seed and feed.

THE WEAKEST POINT

LIKE the oft-mentioned chain, an elevating truck can be no stronger than its weakest point. During the many years in which the Cowan Transveyor has been in constant use, anything likely to prove a weak "link" has had the most careful attention, and the weak points eliminated. The Transveyor now has the wear and strain so well distributed over the entire machine that there doesn't seem to be any wear-out left in it.

TRUCKING TRACTORS

A WESTERN maker of farm trucks and tractors says that they have saved, at the very lowest, 30% of the cost of transferring materials around their works by using the Cowan Transveyor. They believe it is the best truck for the purpose made.

WHERE quality products are produced by up-to-date methods the TRANSVEYOR is sure to be found at work. Its superior all-steel construction, 5-year guarantee, and long record of faithful performance, make it the undisputed leader in the factory trucing field.

The TRANSVEYOR System forms the basis of endless short cuts and savings in forwarding, erecting, storing and shipping. Notice in the above picture how material is easily moved with the Transveyor.

Let us send you an illustrated booklet, showing how the Cowan TRANSVEYOR System operates in **your** business.

A Fine Finish for a Fine Instrument

IN a Jamestown, N. Y., plant they make the cabinets for a celebrated phonograph.

It is the work of master craftsmen, turning out these sounding boxes, the throats, as it were, of the phonographs. The cabinets must have a beautiful, uniform, satin-like finish, so the workmen use

CARBORUNDUM BRAND GARNET CABINET PAPER

They find it will do about forty per cent more work.

They find that it is remarkably flexible—that it lends itself to curves and angles without cracking or splitting—that it lays level without curling under the hand on the flat work.

It cuts fast, it cuts clean, and it's uniform

On the drum sanders and on the belt machines they are also using Carborundum Brand Products and sanding results prove the wisdom of the choice.

PROTECTION—

Safety First! How often have we heard or seen this phrase, yet daily, yes, and oftener, accidents are occurring. Silver's Round Safety Cylinder will protect the operators of any of our new jointers from needless injury. They are greatly appreciated by the operators of these machines and they help wonderfully to increase production. Write us for descriptive matter regarding our complete line of machinery that will interest you.

Automatically Perfect

The operation of Reynolds' Automatic Magazine Fed Screw Driving Machine is Automatically Perfect. It does not require skilled hands to operate, in fact the human element is of little consequence.

It will drive from 1000 to 2000 ordinary screws per hour, thereby increasing your production, and enormously reducing your labor costs.

Very simple to operate. Just fill the hopper with screws, and the machine does the rest.

You cannot afford to be without one.

The Sidman Lumber-Curing Kiln

A Word About Automatic Control for Dry Kilns

After the temperature in a kiln is once brought up to the maximum, it should be held to that point steadily, therefore a Thermostaat may be used. But with a Sidman kiln it is never needed, as the radiation for all kilns is so laid out that a few pounds of exhaust or low pressure steam, will always hold the temperature to the desired point, by properly using the Back Pressure and Reducing Valve available in all power plants.

Humidity or moisture in a kiln is **never the same** over 24 hours at a time, but **must** constantly change to properly cure the lumber. Therefore why an Automatic Controller, which takes more time and attention to regulate for the different percentage of humidity required, than The Sidman simple, flexible method of hand control, and when it can give no better results?

GET US RIGHT: We have no objection to any kind of automatic controllers, and when desired by our clients will furnish them. We place these controllers in the same class with recording gauges, and automatic sprinklers in a Sidman kiln. That they simply add an unnecessary expense to the cost of the kiln, and additional trouble in operating the kiln. We believe all the users of our kiln will agree with us, that the simpler the kiln and its operation, the better the results.

Cut Miles without Grinding

A Characteristic Experience

Richmond, Indiana.

G. M. Diehl Machine Works,
Wabash, Ind.

Gentlemen:—

You may possibly be interested in an experience which we had recently in our factory with your Diehl Heads and Cutters.

Our Sticker man recently made a run of 10,000 stiles, each piece being 73 inches long, of hardwood, in which we cut a groove ¼ inch wide by 9/16 inch deep, and we made the entire run without taking the Heads or Bits off the machine and without resharpening, which makes a total run of a little more than 11½ miles. The Bits would, no doubt, have run quite an additional number of feet before it would have been absolutely necessary to sharpen them. We consider this a very good performance, especially in view of the fact that these stiles were all run from the rough wood and the Heads being used on a four-sided Sticker

Very truly yours,

RICHMOND FURNITURE MFG. CO.,
Per O. H. BRUBAKER, Manager.

Only the Name is Changed

GOODYEAR

MADE IN CANADA

KLINGTITE BELT

(The New Name of EXTRA POWER BELT)

World-Wide Demand for Goodyear's Quality of Belting and Hose Makes Advisable Some Changes in Brand Names

Example — GOODYEAR { *formerly*—"Extra Power" / *now* —"Klingtite"

THE most widely known belting in Canada to-day is "Extra Power."

Now you will buy this same belting as Goodyear Klingtite belting—"Klingtite" — a name adaptable to world-wide use.

In our Sales messages you will read of Goodyear Klingtite instead of Goodyear Extra Power.

Our belting men will talk to you of Goodyear Klingtite instead of "Extra Power."
The familiar brand names of Goodyear belting, hose and packing have been changed so that each of these products may be called by the same name in Australia, Europe, South Africa, India, Japan, China and other countries, as in Canada.

The new brand names are such that they can be used and understood in practically every language and country without change.

Some of the former names designed and reserved for Canadian use do not lend themselves to the complication of languages and conditions prevailing in some of these foreign countries.

Goodyear Belting, Hose and Packing, made in Canada, have become products of world-wide sales.

You will welcome the development of this phase of our business because it means the building up in Canada of another world-wide manufactory. It means increased demand and prosperity for Canadian workers. It means economy and service for you.

Particularly to you, it means that efficient engineers and factory superintendents the world over endorse your choice when you secure belting, hose and packing for your plant. Phone, wire or write the nearest Goodyear branch for a man trained by Goodyear in belting, hose and packing problems to call on you. No obligation.

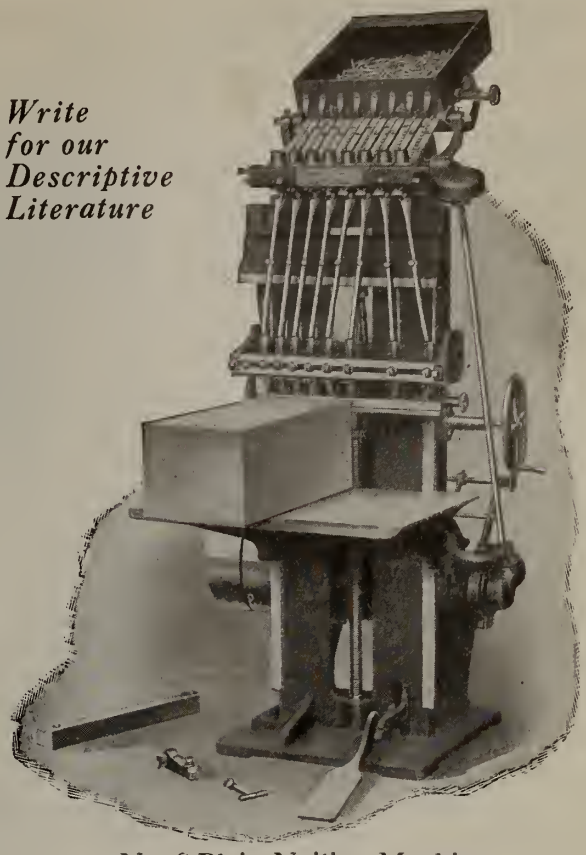
How do YOU Drive Nails?

Write for our Descriptive Literature

The Morgan Automatic Nailing Machine will prove a good investment for any woodworking plant. It drives nails anywhere and in any kind of wood, accurately, effectively and faster than it is possible to do it by hand. It makes money for Box Factories, Canning Factories, Cabinet Factories, Furniture Factories, etc.



No. 8 Plain Nailing Machine

Morgan Machine Co.

DEPT. A ROCHESTER, N.Y.

OLSON FRAME EXTENSION

Increases Service Reduces Costs

Just a Few Users—

Robert Bury Co. Canada, Limited, Toronto, Ontario.

Batts, Limited, Toronto, Ontario.

Gibbard Furniture Company, Napanee, Ontario.

Langmuir Manufacturing Company, Toronto, Ontario.

Gardiner Lumber Company, Galt, Ontario.

Irvin Lumber Company, Toronto, Ontario.

The Olson Frame Extension will mean increased carrying capacity for each of your Ford Trucks. They insure smooth running, perfect balance and easy operation that will prove ideal for the transportation of lumber, furniture, etc., for short or long distances.

Olson Frame Extensions are sold by all Ford dealers. Our nearest branch will be pleased to furnish you with further particulars.

Swedish Crucible Steel Co. of Canada, Limited, Windsor, Ont.

Branches:—614 Excelsior Life Bldg., TORONTO. 285 Beaver Hall Hill, MONTREAL.

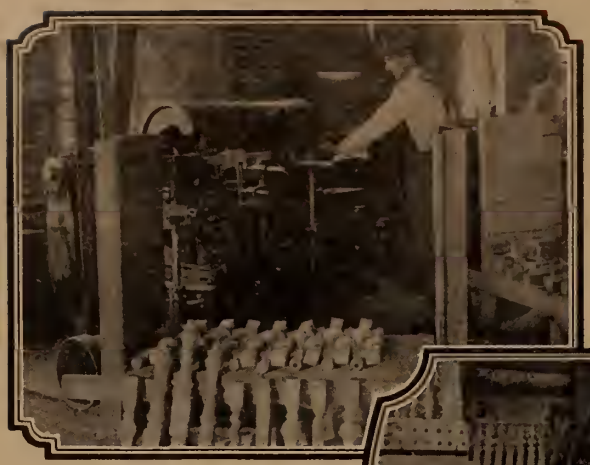
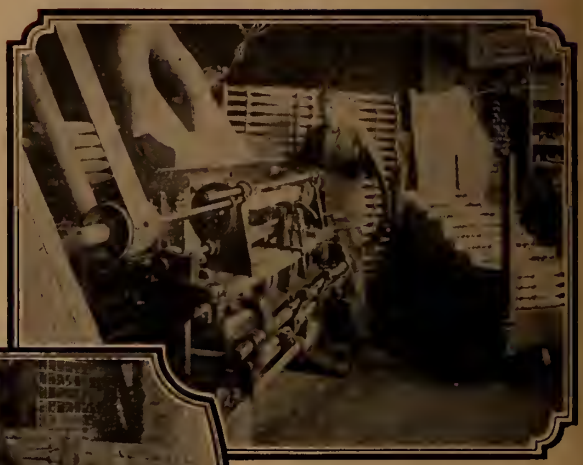
MATTISON
"Automatic"
The Standard Shaping Lathe



A Practical, Economical Machine Turner



Provides unlimited capacity and minimizes Labor Cost.

Allows the designer free play in the creation of elaborate or complicated patterns.

Efficient and dependable — requires but an ordinary mechanic to operate.

Thru the various stages of its development, the "Mattison" has given profitable service to its users

Conditions faced in 3,000 installations brought problems, the solving of which showed the way to the improvements now designed into the latest model "Mattison."

CANADIAN WOODWORKER and Furniture Manufacturer

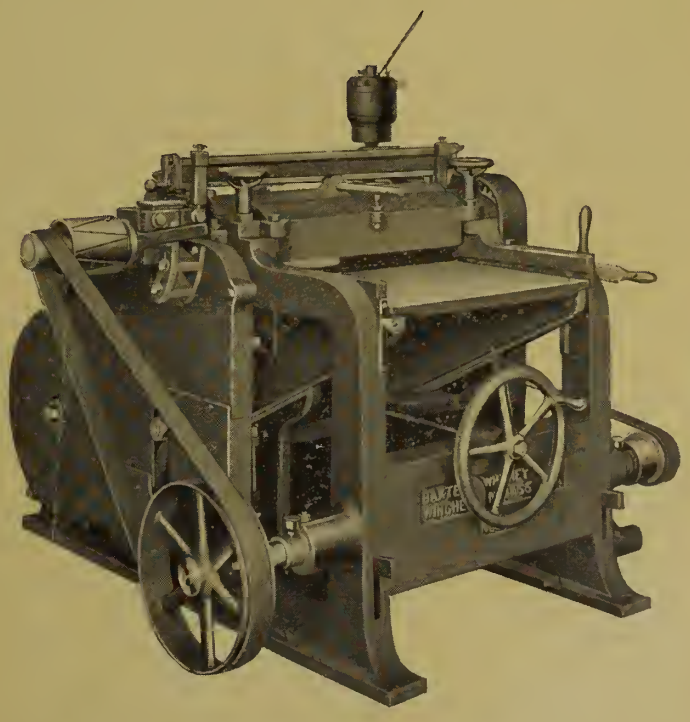
The Planing Counts Most

A planer that does its duty often swings the business up to success—buying a planer merits your deep study

Fully and frankly, we tell you about

Whitney Planers

Single and Double Surfacers



Have features which appeal to every woodworker, such as a rigid frame with ample weight of metal—a BED raised and lowered on SOLID WEDGES operating on wide tracks—a HARDENED CENTER TABLE made extra thick.

An AUTOMATIC CHIPBREAKER that remains the same distance from the cutter head, regardless of the cut taken—DETACHABLE CLAMP CYLINDER BOXES—a cutterhead with long bearings of large diameter and MACHINE-CUT GEARS, are but a few of the features that enable Whitney Surfacers to do superior surfacing at the lowest cost.

Just Write Us a Line

Notice how Whitney Planers are found in wood working shops that are considered representative.

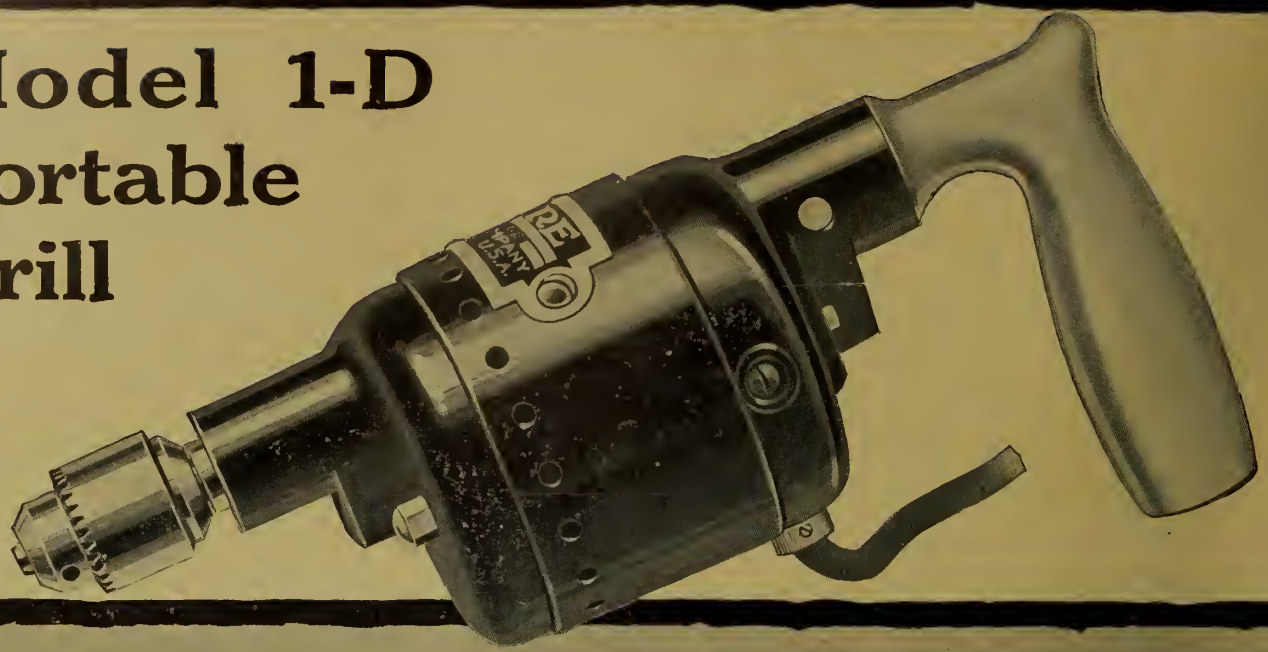
Model 1-D Portable Drill



HANDY—ECONOMICAL—EFFICIENT

Specifications:

Length—10 inches.

Weight—4¾ pounds.

Capacity—Steel, 0 to 3/16". Wood and alloys, 0 to ¼".

Motor—Universal, on either direct or alternating current.

Diameter of Motor—3⅜ inches.

Spindle—Offset from center 3/32".

Helical Gears.

Aluminum Handle.

Complete with 10-ft. cord, plug, switch and chuck.

Jacob's Chucks used as a regular equipment.

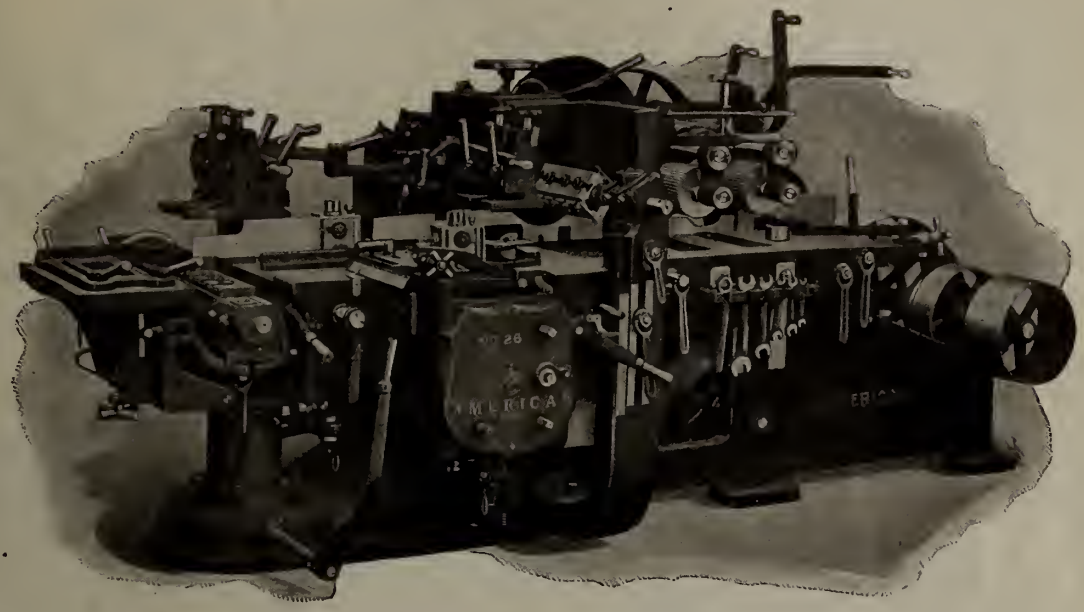
FOR speed in drilling and countersinking small holes, this tool is just what you need. It can be used on any kind of material—steel, iron, brass, aluminum or wood—and gives lasting service.

If your dealer cannot supply you with the Model 1-D, tell us about your requirements.

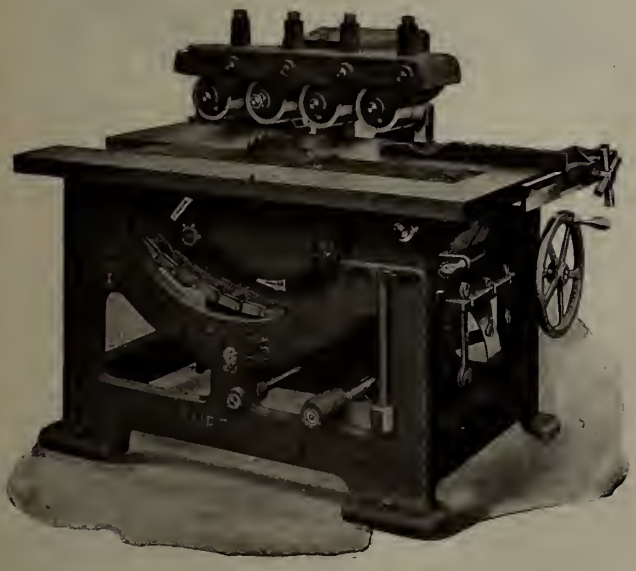
Wisconsin Electric Company
7126 Sixteenth Street, Racine, Wisconsin, U. S. A.

DUMORE GEARED ELECTRIC DRILLS

American No. 26 Four Sided Outside Moulder



A fast-feed machine—slip on and off heads—quick adjustments—heavy type—chip-breaker throws back out of the way when applying or changing cutters—Large size feed rolls with chain drive—and many other improvements which make possible quicker setting up and operation on this outside Moulder.



American No. 25 Edging Saw

Large size arbor and pulley allows high speed with plenty of power. Two chains in table and four sets upper feed rolls. Strong and accurate feed. Owing to arrangement of upper feed rolls very short stock can be fed through this machine. Compact, but with strength in every line and dimension.

Both of these machines for delivery from our Toronto warehouse.

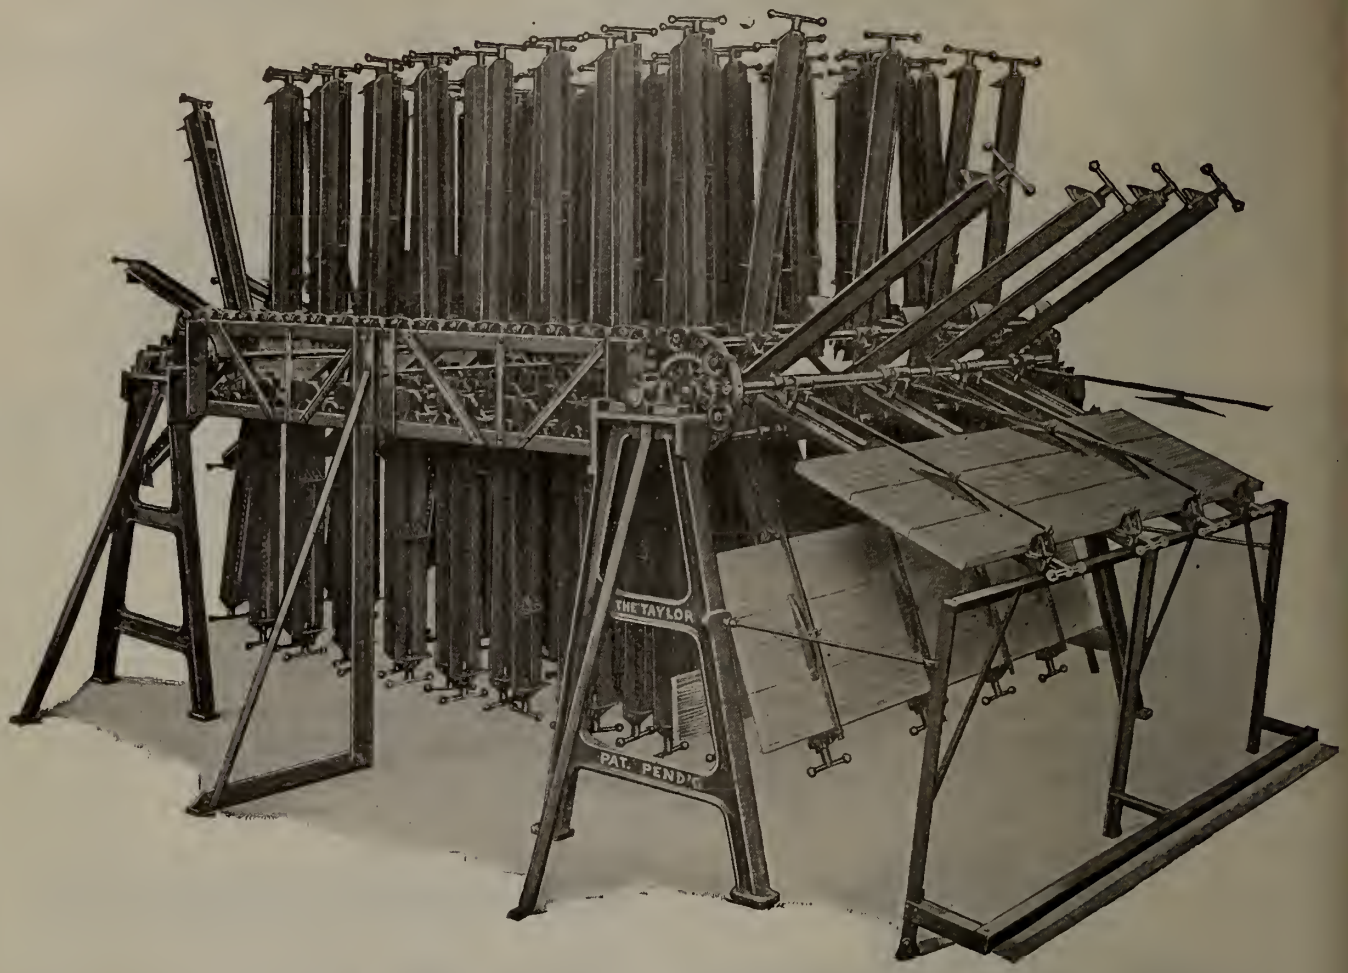
"Everything in Machinery"

CLAMP The Taylor TRADE MARK CARRIER



Forty section machine carrying 160 clamps, measuring 8 ft. 2½ in. between shaft centers.

The clamp is one of the most interesting features of the clamp carrier. A remarkable strain can be applied with greatest ease; the work it turns out—both thick and thin stock—is 100 per cent. perfect.

An Engineering concern recently wrote:

"I am recommending Taylor clamps to the Germain Mfg. Co. because I have proven the clamps more efficient through scientific time studies on both and all existing types of gluing-up machines and devices."

As a result of the above recommendations, The Germain Mfg. Co. referred to bought two Taylor carriers. They installed them, and tested them and have since purchased two more. We can tell you numerous instances where customers are using from two to nine Taylor carriers each as a result of similar experiences.

Let us prove the truth of these claims by showing you one of these carriers in operation, or you can try the clamps out on your own work. Ask for C. C. Folder and further information.

No. 4 Continuous Feed GLUE JOINTER

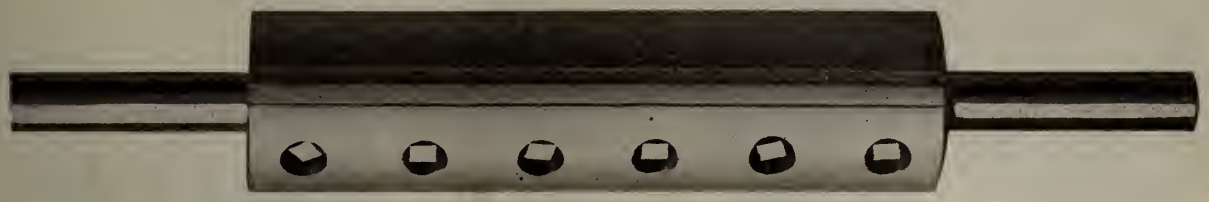
Strongest and most complete machine on the market.
Any part may be readily removed or renewed.
Feeds in opposite direction, giving 100 feet per minute.
Works material from six inches up to any length desired.
Also from one quarter to 3 inches thick, and from three-quarters of an inch wide up to any width.
1 set Shimer Special Jointer Heads supplied with machine.

Investigate the merits of this machine—it will pay you!

Jackson, Cochrane & Company

KITCHENER - CANADA

The Shimer Round Safety Cylinder with High Speed Knives



A Round Safety Cylinder that will Appeal to the Buyer and the User for Three Reasons:

The first is our adjusting nut for setting the knives. It is the only cylinder with properly located adjusting nuts for setting the knives, which, with our way, can be set to 1-1000 of an inch.
The second is our way of holding the knife without tapping into the head.
The third is the correct angle of cut for the knives.

Made for Any of the Different Makers' Machines and in Any Length Cylinder.

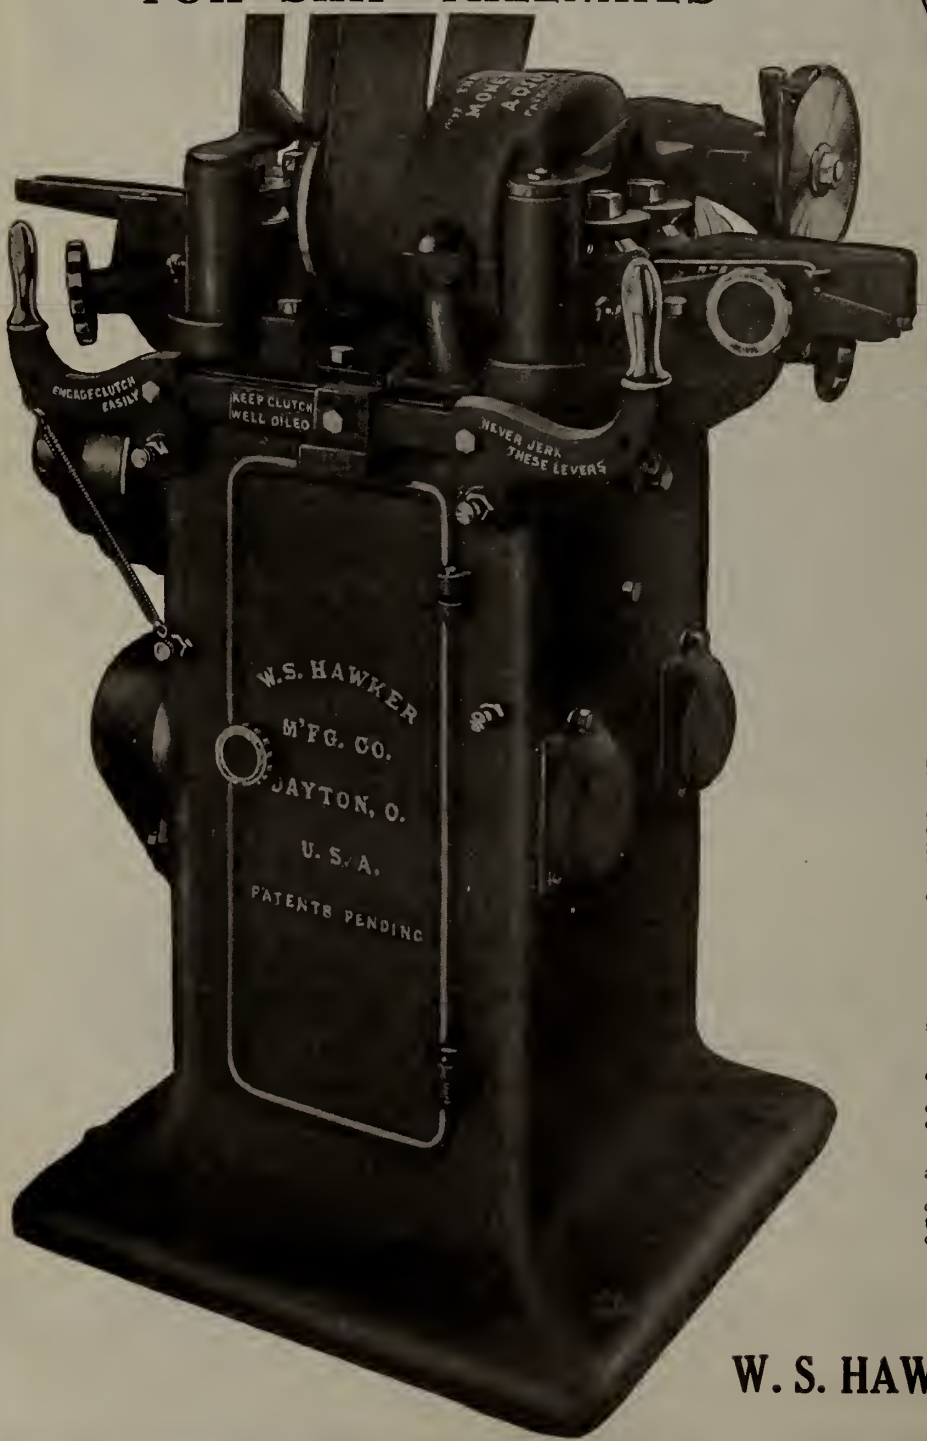
FOR SHIP TREENAILS



W. S. HAWKER.

Inventor and Designer of the World's most efficient Tubular Turning Machinery

THE

Money Maker Adjustable Rod and Dowel Machine

The machine that is sent under a guarantee to show you a gain of from 100 to 400 per cent. before you buy it.

The improved dowel machine that 90 per cent. of the largest and oldest machinery builders and dealers now endorse and recommend in preference to the solid chuck machines they themselves previously built.

One cutter head turns from 1/4 in. to 2 in. diameter.

Turns hard or soft wood equally well.

Handles heavy, oversized squares.

No choking of the cutter head.

Smooth stock.

Accurate sizes.

Works stock as short as five inches.

Rolls automatically centre variations in squares.

Machines built to turn from 1/8 to 6 in.

We want to hear from every user of a solid chuck dowel machine.

We can save you from one dollar out of every two, to four out of every five, that the operation of solid chuck machines costs you.

Engagements for competitive test solicited.

Formal orders not solicited. All sales made after demonstration.

The only question is, are you willing to cut cost of your dowel turning to one-half or one-third of what it costs with any make of solid chuck machine?

Machine delivers the goods before you buy.

State conditions of stock closely.

Special conditions require special equipment.

COWAN & COMPANY OF GALT, LIMITED, Galt, Canada

Removing the Brake

FRICTION is the relentless enemy of efficient operation. In the average mill it destroys at least 25 per cent. of all the power produced or bought.

Yet this tremendous waste can be largely reduced—in fact, has been reduced to a minimum in hundreds of plants of every description through the aid of SKF Bearing Engineers.

These practical engineers, backed by the fund of knowledge constantly available in the SKF Research Laboratories render an invaluable service. They remove the brake that slows down production by solving perplexing and costly friction problems.

Manufacturers are invited to avail themselves of this bearing service at any time.

No. 140-A Surfacer will set New Standard for Production and Grades in your Mill and Factory

No. 140-A Patented Double Cylinder Surfacer

No. 351 Automatic Feeder

Furniture manufacturers are quick to realize that a wonderful finish invariably sells the furniture. No. 140-A whether used for general surfacing or the finest smoothing work will set new standards for production costs and grades in your mill or factory.

No. 140-A is especially valuable to concerns which do not buy the highest grade of lumber, as it will finish this low grade stock perfectly, not tearing out even when working knotty or cross-grained stock.

Exclusive Fay & Egan construction features, make this machine a fine investment from the standpoint of initial cost, power and up-keep expense, and results.

Send for our special Bulletin B-12 for full information.

Ohio Hardwoods

Why buy inferior stock when you can get the following items from my Ohio Mills?

2 cars 10/4 No. 2 Com. & Better Hard Maple. Choice stock—very wide.
2 cars 4/4 Quartered White Oak, Com. and Better, Fine.
1 car 4/4 Quartered White Oak, No. 2 Com.
5 cars 4/4 Plain White Oak, Com. and Btr.
2 cars 4/4 Log Run Poplar and 2 cars Chestnut.
1 car 6/4 Com. and Btr. Plain Oak, extra wide, 50% FAS.

With 40% freight advance almost a certainty, and lack of cars, hadn't you better send us that order?

With special attention to **Oak, Chestnut, Poplar, Cherry, Walnut, Gum and Basswood.**

OUR MOTTO

REASONABLE PRICES – that you can afford to pay.
EFFICIENT SERVICE — that you have a right to expect
FAIR TREATMENT — that you can depend on getting

We would appreciate an opportunity of furnishing a portion of your lumber requirements.

GLIMPSES INTO THE SPIRIT OF AMERICA'S SECOND GREATEST INDUSTRY. (*No. 1*)

Similarity of Ideals Is What Makes a Nation

It was America that changed the definition of "nationality" from a similarity of race to a similarity of taste. Also it was America which first elevated the widespread sense of *patriotism* from a mere massing of individual ambitions into a solider fabric of *mutual aids* to *Community Needs.*

It is singular that the railroads, the postal service, the telegraph and telephone, the fire and water departments, meat packing, steel making, lumbering and various other universal needs have achieved their present degree of high relative efficiency apparently without much regard for whether they were so-called private or so-called public enterprises.

This is because one of the prime incentives has been a certain pride in *Public Service,* with personal pride in making a *first class job* of it. Disregarding all theories of social organization, it is certain that, in any case, *the same men* would have done the same jobs in the same faithful and proudly progressive way—because of their proven superior fitness for the vital and difficult work in hand.

So it seems to be more a matter of *efficient spirit* in *public service* than it is of just who or what is the immediate employer of the kind of special talent needed.

Next to food, *shelter* is the most important thing for mankind, and for this purpose the varied products of TREES have been his chief reliance ever since the increasing population caused a shortage of caves.

So the American *Lumber Industry* is, and always has been, practically second to agriculture as a facile, dependable and economical reliance for us all.

Of course, in most cases, the harder the wood the longer it lasts and the more serviceable it is. Therefore, it is that the notable variety of Hardwoods in our great mid-south forests, are so vital a fact of our national life and comfort.

The breadth of concept and purpose, in war and peace, of the many thousands of independent loggers, sawyers, executives and fine craftsmen engaged with our Southern Hardwoods is one of the most encouraging truths of American Industry—just as their product is one of the elemental daily and hourly needs of the life of every one of us.

YOU CANNOT EVEN SIT ON A CHAIR without realizing this. (*All chairs are of hardwood.*) *You cannot even reprove your young son for accidentally digging his restless heel against the INTERIOR TRIM of your home without realizing this — and without being glad that it is hardwood, and thus practically "mar-proof."*

The splendid co-operation in the American hardwood manufacturing industry, among all elements concerned, deserves not only mutual recognition among themselves but also a fuller knowledge by the consuming public—which means everybody. This it will be our purpose to help along by a few simple little stories of *facts* that are much *simpler,* and much *more important,* and *vastly more fascinating,* than they may have seemed.

IOWA BLACK WALNUT

Used in the New Pennsylvania Hotel, New York City

We believe that you will be interested in a statement recently made by the management of this hotel:—

> "The fact the we have chosen Walnut as a furniture wood and for the interior trim for the largest hotel in the world, and a hotel which is designed for New York's most discriminating hotel patrons, speaks for itself. Could we say more?"

This proves that the trend is unquestionably towards Walnut and we urge you to prepare accordingly.

We would appreciate a list of your needs.

Des Moines Sawmill Co.
DES MOINES, IOWA

"Hartzell's Choice Walnut"

Are you a believer in the fact that

"Quality Counts"

Have you ever experienced that delightful sensation of accidently overhearing a person speaking in a complimentary way of the "Quality of your Product."

"We emphasize Quality"

If your finished product is made from Hartzell's American Walnut Lumber and Veneers you will have the last word in "Quality"

There is a difference and it will pay you to think it over.

Samples submitted and quotations made upon application.

Our Motto is
"Satisfied Customers."

An American Walnut Tree Selected For Our

LUMBER

PURCHASING AGENTS:—

Owing to embargoes and shipping delays, it is practically necessary for purchase orders to be placed thirty days earlier than in former years—we think this is especially advisable in Walnut today.

The years of experience of our buyers and the time and care used by them in selecting the raw material, for our output, terminates in the high character and quality of our lumber.

ALL GRADES AND THICKNESSES—American Walnut Exclusively

Pickrel Walnut Company

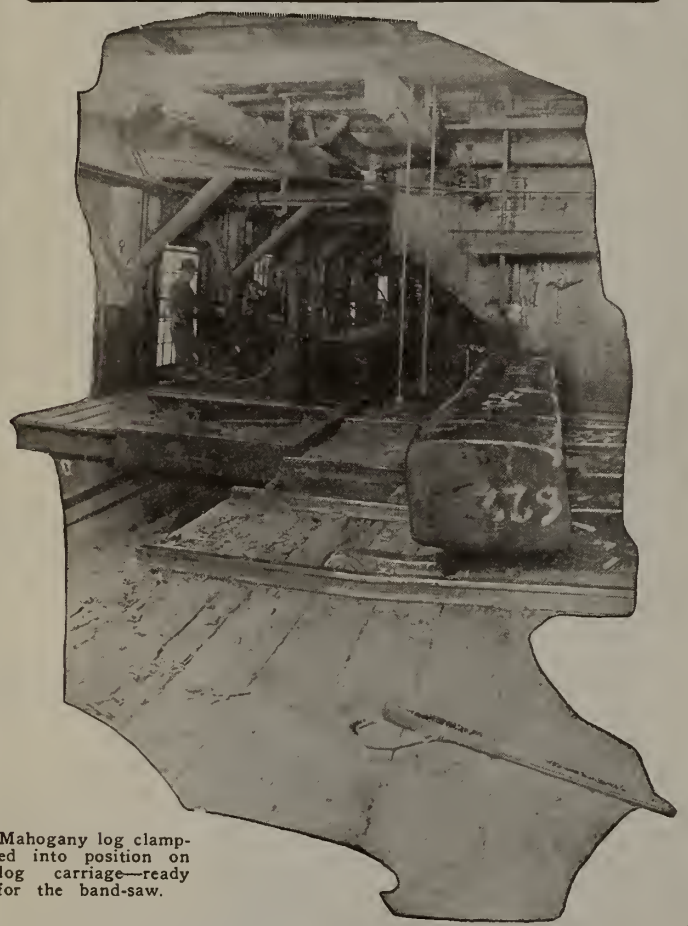
ASTORIA MAHOGANY

LUMBER & VENEERS



Mahogany log clamped into position on log carriage—ready for the band-saw.

Lumber or Veneer?

The soundest mahogany logs are unsolved mysteries until the band-saws reveal their inner beauty. Then the exacting demands of our experts decide whether each log is satisfactory for lumber or veneer. Careful attention to detail in maintaining a high standard is one of the elements which have made us the largest complete mahogany organization on the Atlantic and Gulf Seaboard.

Wake-up, Mr. Furniture Man!
Walnut is Plentiful!

AMERICAN WALNUT

"The Cabinet-wood Superlative"

No "Jimmies" Needed

In *W*alnut furniture, no matter how old or how new, the drawers slide smoothly and the doors open and close without jamming. If the workmanship is good, give the cabinet-maker the credit. He in turn gives *W*alnut most of the credit—because often he has done just as careful work in other woods and then has been blamed, perhaps, because the moving parts "stuck." So *he likes Walnut.* ("It gives his skill a real chanst.")

The supreme beauty of *W*alnut, in addition to the above qualities (and plus its "workability" and its "carvability"), accounts for the world-old supremacy of *W*alnut as a cabinet-wood—and its price permits its use in *every grade* of furniture that the careful buyer is likely to ever consider.

It will help you in your furniture buying to *know all about* American Walnut. (The furniture man will respect your discrimination. He knows the facts—and is glad that you do.)

Don't fail to WRITE NOW for the WALNUT BOOK—edition de luxe—which will come by return mail with our compliments—and our confidence in your appreciation of its value.

AMERICAN WALNUT
MANUFACTURERS' ASSOCIATION
1019, 616 S. Michigan Blvd., Chicago

ALL BRANCHES OF THE FURNITURE TRADE

are feeling strongly the Effects of the series of tributes to our American Walnut which are running continuously in most of the Best Publications in America. Above is an example.

There are still a few Furniture Houses in the Country

who are giving some of their better-posted competitors a great advantage over them with the Best Trade. WHY? Simply because they "heard somebody say" that American Walnut was getting scarce. Let them ask us for THE FACTS! (See address above.)

Vol. 20 Toronto, August, 1920 No. 8

Preparing for Competition

The long heralded, much talked about business depression, with its consequent break in prices, does not seem to have arrived, nor is it likely to do so. The reasons why the future should not be viewed with alarm are too numerous and have been expressed too often in the columns of the "Canadian Woodworker" to need recapitulation. True the demand for many commodities has eased a little and a slight air of uncertainty pervades our business life. This state of affairs is not altogether unusual or unexpected at this season as July and August are usually quiet months—months of preparation for fall and winter business.

The race is not always to the strong. It is the well-trained athlete who generally comes out ahead. So it is in business. The manufacturer who is best prepared is the one who is able to successfully meet and over-ride competition. Whether or not we are due for a period of depression is problematical, and depends on conditions largely beyond our control, but there is one thing certain and that is that each day brings us that much nearer the time when supply will more nearly equal the demand and competition will be keener.

The far-seeing manufacturer is the one who is taking advantage of the present lull and is putting his plant in order, preparing for the time when the best methods and the most efficient equipment will be needed to command an adequate volume of business. At this period every woodworker should take counsel with himself, analyze his manufacturing methods, check over his production system and see if the rearranging of the present equipment so as to eliminate lost motion and excessive handling, the systematizing of prodution methods, the standardizing of manufacturing operations or the installing of some modern, labor-saving, production machines will not result in reduced manufacturing costs and increased production per man.

A writer in the house organ of a well known organization has outlined the present situation in a clear forcible manner, as follows: "To date, feverish demand has made it possible for any manufacturer, no matter how poor his manufacturing methods or how antiquated his equipment, to secure all the orders he could handle at a good profit, in spite of high manufacturing costs and regardless of competition. When supply has again caught up with demand—when the buying public comes back to earth—when all manufacturers are again competing for the same business, then it will be the concern that kept right on studying and analysing each operation, devising time saving methods, and replacing low production equipment with the best of labor saving machinery that will be able to satisfy the buyer who is getting more critical as to price, style, quality, delivery and other factors that determine the placing of an order.

"The 'stand pat' manufacturer who sees in the present uncertain outlook only another excuse for continuing his policy of using expensive, time-wasting old-style equipment, will soon be compelled to reduce the size of his profits when he finds himself in competition with progressive manufacturers who took time by the forelock and by taking advantage of every available means for increasing the efficiency of their plant and organization, secured greater production per man and at reduced cost."

Is the day of keen competition going to find you in a position where you will find it necessary to cut your profits to secure sufficient business to keep the factory running or will you be able to meet all legitimae competition on, at least, equal terms? The size of the plant will not count as much as the efficiency of its organization and equipment.

Winning Over the Employees

A well known American authoritty on industrial relations is responsible for the statement that employees do not want something for nothing, any more than the employer wishes to grant it. What he does believe in is for the manufacturer to give his workmen a square deal and do things for them. Make them feel that their interests are being considered and that an effort is being made to assist them both in their work and in their homes.

What is to prevent a manufacturer from occasionally bringing in a carload of coal, sugar or potatoes and distributing it in small lots at wholesale cost? This is only one suggestion. There are many other ways in which a manufacturer can apply his buying power and influence so as to benefit those in his employ. This is an honest, straight-forward attempt to assist in reducing living expenses. Such an attitude cannot help but win good will and co-operation.

Construction Details of Modern Home

Type of Frame Usually Adopted —Sequence of Construction Operations— Laying Out Rooms and Halls—Details of Framing Roof

By W. H. Shaw

To write a history of wooden construction in building would be to write a history of the country. The early settlers in the country came chiefly from parts of England, where wood construction was almost universal. They were familiar with wood; they knew how to use it; and they knew good wood when they found it. So they naturally went to the forests for the material for their homes, although stone and clay were to be found in practically every community. So satisfactory a building material did they find in the wood of the white pine forests for the building of their first crude homes, that in the days of prosperity when the stately Colonial mansions were erected with the greatest care, where no labor or expense was spared, the same materials was used.

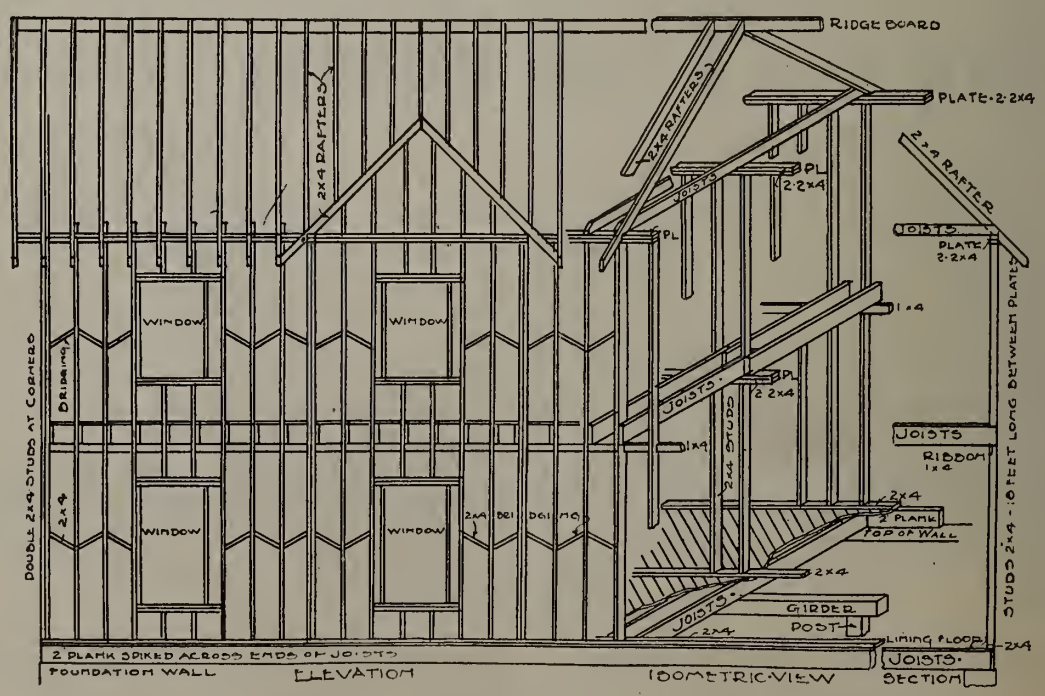
As is usual in early settlements, everything is influenced by the usage in the home-country. England was building homes of the Georgian type, largely of stone and brick. The colonial builders found their wood an excellent medium for carving the most subtle curves and holding a fine edge, even when exposed to the weather. So they copied the stately lines of the English mansions, developing the delicate moulding and carved motifs, adapting the classic orders of architecture to meet the requirements of wood and developing bit by bit what the discriminating call the Georgian Period of Architecture in America, but what to the general public come under the blanket-term of Colonial Architecture. So with the demand for houses to-day, when it is a case of need—real need, all the substitutes are passed up, and we are back to that first principle—wood construction.

What is known as the baloon frame is generally employed in the construction of the wood house of the present period. The fundamental principles of the construction are still preserved, yet the methods as to detail have undergone radical changes. In the early days intricate framing and numberless difficult joints were considered absolutely necessary, but simplicity is now the key note of construction details. In the methods illustrated the work, is shown, not as it might be under the very best practice, but as the modern workman would put it together if felt to his own devices and as would be acceptable in most localities.

The usual treatment is followed regarding the basement, viz., the posts, girders, and joists erected upon the foundation and the lining floor is laid in place ready for the frame. The next step is to spike a 2 x 4 in place about the outer walls directly upon the lining, as indicated on the accompanying section. The partitions of the various rooms are then outlined upon the lining floor in 2 x 4's. In each case where the partition has the same direction as the joists, the joists should be doubled beneath it.

Windows and Door Openings.

The studs are now erected; spaced 16 inches on centre and doubled at corners. No notice is ordinarily taken of the position of openings at this time either in the exterior or interior walls. There would seem to be some advantage in marking the position of doors and windows upon the 2 x 4 shoe before the studs are placed but it is seldom done. The studs of the outside walls are shown 18 feet long, this being the length commonly used where level ceilings are to obtain in the second storey. This gives 9 feet for the first

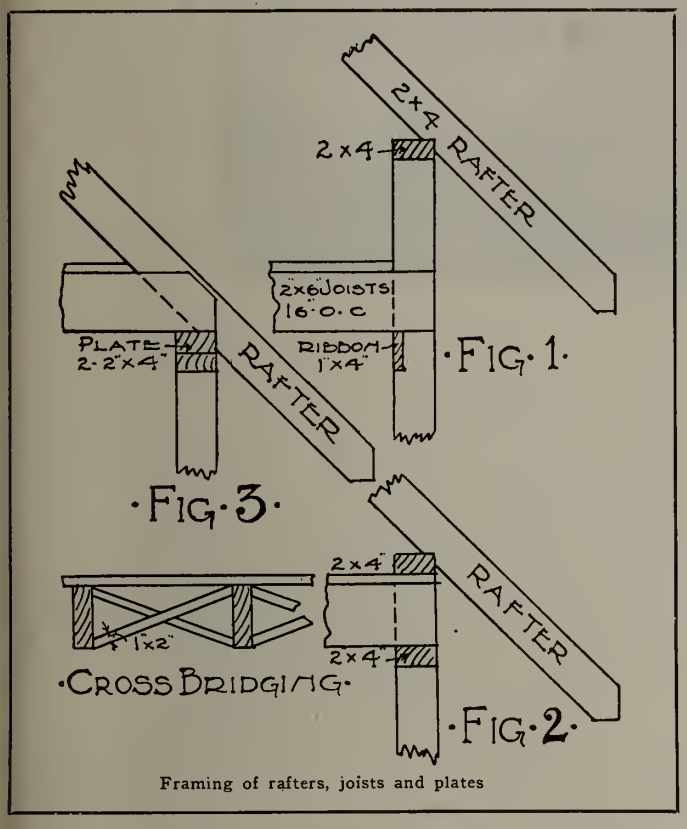


Details of baloon type frame

storey and 8 feet 5 inches for the second storey, both measured in the clear, without cutting the stud to waste.

The second floor joists rest upon a ribbon, as it is called, 1 inch by 7 inches, notched into these studs to keep the wall flush on the inside after plastering. See section. The joists may also be notched to receive the ribbon, but it is seldom considered necessary, the joists being carefully spiked to the stud..

The interior studs are cut in storey lengths only, with provision for a plate, consisting of two 2 x 4's



Framing of rafters, joists and plates

spiked across their upright ends, upon which rest the inner ends of the second floor joist. The interior studs of the second storey rest upon this plate, and continue up to a similar plate that supports the attic joists. See isometric view.

Details Roof Construction.

The rafters and other joists are framed to a double 2 x 4 plate spiked to the upper ends of the outside studs, the rafters being notched to secure a better bed and the corner of the joists are bevelled off in line with the rafters as shown on the isometic view. The upper ends of the rafters are spiked to a ridge board one inch in thickness and in depths as required by pitch of the rafters.

Where rafters coming from different directions intersect a hip or valley is formed and a hip or valley rafter is necessary to carry the load coming from both directions. This requires a strong timber deeper than the joists framed against it, to include the whole depth of their cut ends. The elevation shows a portion of the exterior with framing all in place. The studs are shown doubled at the corners, spaced 16 inches on centres, starting at the bottom from a 2 x 4 shoe and ending in a double plate of 2 x 4 at the top; on which rest the attic joists and roof rafters. The second floor joists are shown resting upon the ribbon and the flooring in place.

Short pieces of 2 x 4 should be cut to fit between the studs of all walls, as indicated, for bridging. As soon as the floor joists are in place they should be bridged with 1-inch by 2 inch cross bridging, as shown in figure. One line of bridging in a span of 14 feet or less is sufficient. Greater spans should have two or more lines of bridging.

Putting in Openings.

Window openings are shown with 2 x 4 doubled about them showing method of construction and support. These openings are cut in after the frame is up and should be carefully framed for strength and accuracy. The studs at either side of the window frame should be set to allow a weight pocket from 2¼ to 2½ inches wide. The blind stop, which is that portion of the window next to and underneath the outside casing, should always be wide enough to nail to the studding at the sides, holding the frame securely in place.

Two other methods of placing the rafters and attic joists are shown and a larger drawing of the first method described. Fig. 1 shows the attic joists supported upon a ribbon like that at the second floor level, with the rafters resting upon the plate at the top of the studding. This allows more headroom in the attic at the outer walls, but if the first and second stories are of the usual heights, requires extra long studs, which mean greater expense. It does give a greater height to the cornice and more space above the second storey windows, a feature to be desired. Fig. 2 shows the attic joists resting upon a single plate with an additional piece spiked to them above, on which the rafters rest. This requires no more material. Fig. 3 shown with a double plate, requires a little less framing in its erection and gives a little more height to the building.

Run Sheathing Diagonally.

The outside boarding or sheathing should be put on diagonally and should be dressed and matched, affording strength to the whole frame, as well as keeping out cold. It will be found that loose knots and knot-holes are in evidence after the walls are sheathed, unless a very superior grade of lumber was used. All such places should be covered with waste pieces of shingle, carefully nailed in place on the inside with short nails. Care should be taken that all portions of the frame are level and plumb, thus avoiding trouble when the more important finishing materials are placed in position.

All portions should be carefully nailed not only to insure safety but to avoid settlement and displacement so often indicated by cracked plastering.

Ship Building Plant Acquired

Capt. A. Berquist, a well-known tug operator and builder of Victoria, B.C., is repotred to have taken over a considerable part of the Port Ellice shipyards of the Foundation Company. The material purchased includes two of the large overhead gantrys, four ship-building ways, various electrically-driven saws and other ship-building plant and buildings. It is understood that Capt. Berquist intends building a number of tugs and barges.

The Point Ellice property is an excellently laid out ship-building site with four shipways and well equipped with sawmill, machine shops, blacksmith shop and offices. On these four ways the Foundation Company built ten of the twenty 3,000-ton wooden steamships ordered by the French Government.

An attractive, well planned bungalow

Two Cosy Bungalows of Approved Design

Extremely popular type of dwelling—Constructed to meet requirements of cold climate

THE bungalow, with its delightful lines and cosy appearance, seems to have come to stay, it is in fact steadily gaining in popular fancy. In sunny California, where the name "California Bungalow" originated, this type of dwelling is found in almost endless variety, ranging from a plain rectangular one-storey cottage, with wide verandah, to the more expensive, highly ornate home with its wide over-hanging roof with exposed rafters, attractive dormers, flowered pergola and convenient port cochere.

The accompanying illustrations and plans were taken from the plan book of the Canadian Aladdin Co., manufacturers of ready-cut houses, and are of two popular bungalow designs which embody many desirable features. The larger house has proved to be one of the most popular designs brought out by this company. In the illustration it is shown finished in stucco, but if soft, warm effects are desired, a shingle or siding wall may be employed.

Long, Low Lines Preferable.

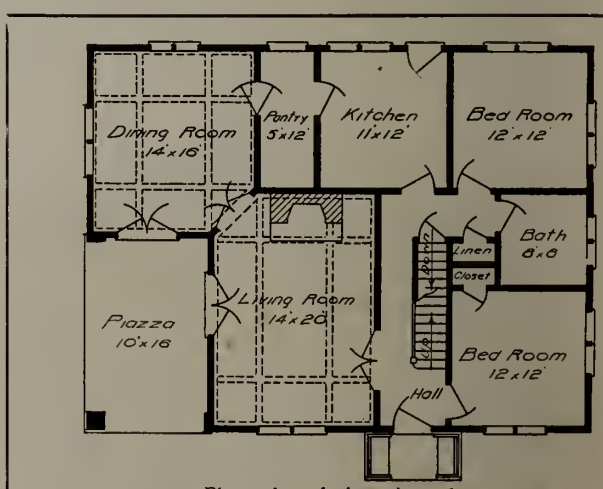
The long, low roof line with its impression of coziness and comfort, shaded piazza and the hooded entrance with its colonial benches and door, give an air of hospitality which cannot fail but to appeal to all who view it. One can readily see that the casement window, with small rectangular panes, is peculiarly adapted to a house of this type.

The floor of both piazza and porch are of concrete or flag stones. Entrance is made into a wide hall Here one gets an impression of spaciousness, for regardless of the way one may turn, the vision leads out through doors and windows and on into the surrounding grounds.

Access to the living room from the hall is made through a wide opening fitted with French doors. Here one finds a massive, dignified fire-place, beamed ceiling and doors opening on to the verandah. If resired, the fire-place may be constructed in the corner rather than along the wall. The dining-room is well lighted and ventilated and is provided with doors giving access to the piazza. This room woud be delightfully cool during the summer months.

A Very Convenient Arrangement.

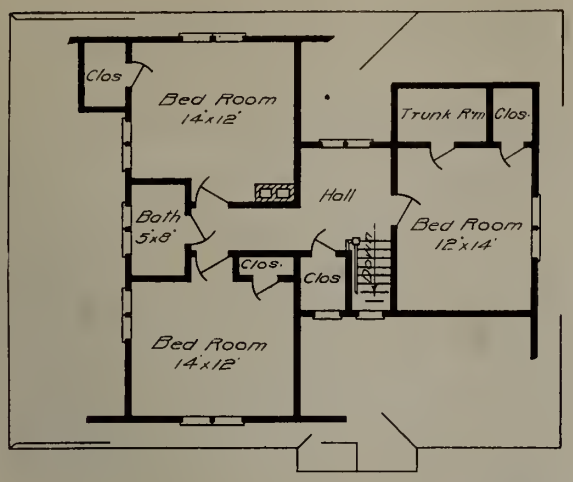
The dining-room and kitchen are separated by a roomy pantry. This is a very convenient arrangement as well as tending to prevent the odors emanating in the kitchen from reaching the dining-room.

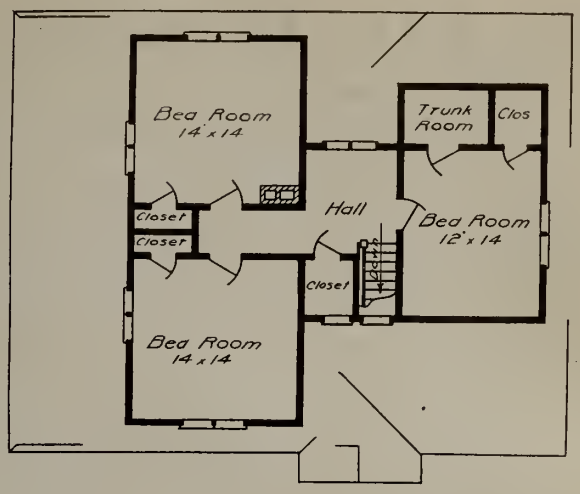


Floor plan of above bungalow

The rest of the lower floor is laid off to provide two bedrooms and a bath.

Alternating plans are suggested for the lay-out of the second floor. One has provision made for three airy, well-lighted bedrooms with spacious closets. The other gives the same accommodation, but by





Alternative second floor plans

reducing the size of two of the rooms it has been found possible to instal a small bathroom on this floor.

The second illustration is of a substantial, comfortable house built on less pretentious lines. In appearance it is very attractive. The verandah extends most of the way across the front but is constructed with a high ceiling so that an abundant supply of light and air is admitted to the front rooms. The shingle walls and the exposed rafter ends are in keeping with the best in bungalow design. The proportions of this building are such that one does not realize its size. A glance at the floor plan shows that it contains a number of good-sized rooms.

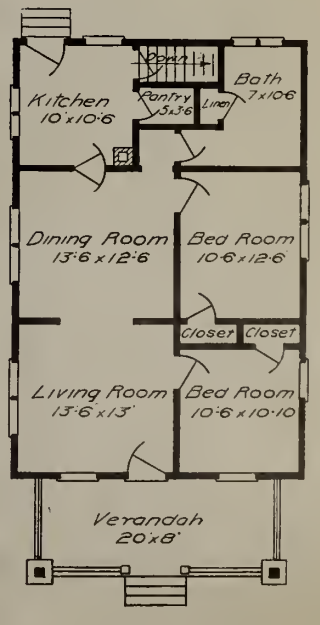
Keeping Down Construction Costs.

All waste space is eliminated, an entrance being made directly into the living-room. This is in keeping with the trend of modern home planning. With building material and construction costs high, expensive space is being conserved and costs lowered by eliminating or reducing halls and vestibules. A framed opening divides the dining and living-room. Here one could have an attractive colonade with such built-in features as a book-case and writing-desk.

One criticism of the living-room might be that a sufficient wall space has not been provided to allow a piano to be placed to advantage. One of the newer elements in modern home-planning is to see that suitable provision is made for all the more important pieces of household furniture. To put it in other words, the furniture is first visualized in position and the lay-out of doors and windows planned accordingly.

Ventilating the Kitchen.

The floor plan as shown allows for three fair-sized bedrooms, each with a roomy clothes-closet. The floor sizes as given are such that stock lengths of joists, etc., could be worked without any cutting, thus doing away with a certain amount of waste and saving the time required to cut these pieces to length. Having two windows in the kitchen means that this department may be kept reasonably cool during the summer as a movement of air may be induced by opening both windows. A transom above the rear door would also assist in securing adequate ventilation.



Less expensive bungalow with floor plan

Are You Boosting Publicity Campaign?

Furniture Manufacturers Endorse New Movement—Details of "Better Homes Campaign"—Outline General Conditions—Future Viewed with Confidence

A well-attended general meeting of the Furniture Manufacturers' Association was held in Toronto on Tuesday, July 27th. This was called in conformance with their policy of having regular meetings at stated intervals. About forty-four manufacturers were in attendance. Several interesting addresses were given on questions of interest and the work of the newly-formed publicity bureau was outlined.

Replying to an inquiry, the secretary, Mr. Cawkell, stated that the Western Canada Colonization Association, which had been recently formed in Western Canada, was well worthy of active support. The men connected with the movement were upstanding, practical business men and the movement itself has received the endorsement of many of the most prominent men in Canada. The object of this association is to populate the western farm lands and to assist all settlers going on the land by advising as to character of soil, etc., and furnishing other information of interest and value. It is an honest and intelligent effort to develop the West along practical lines, and should receive the consideration and support of the furniture manufacturers.

Outline of Business Conditions

James E. Ferguson of the cost accounting department, outlined general trade conditions with particular reference to the furniture industry. He stated that business conditions in general during the past few weeks have not shown any marked improvement. A spirit of caution pervades the market and there is reluctance on the part of buyers and consumers to take further steps, pending the clearing up, to some extent at least, of the present uncertain situation. The vibrations caused by the spring price cutting have not entirely disappeared and although talk of panic is scarcely heard now, there is being exercised a caution which will in itself help greatly to clarify the situation.

The iron and steel industry continues to be exceptionally busy, goods are hard to get and prices are continually advancing. Nails are now quoted at $6.25 base, and practically all items used in the industry are scarce. Lumber has declined somewhat, our figures showing a reduction of 3.8 per cent. in this group since last April. Quartered oak and gum show greatest decline and are likely to drop still further. Native woods are firmer. Plain oak is also easier, but not to the same extent There has been no report of easier prices on walnut and mahogany. Veneers of all kinds are still difficult to obtain.

Finishing materials are easier, shellac, oil and turpentine showing appreciable declines. The supply of finishing materials is good, little complaint of slow delivery being heard. It is expected that this group will get easier during the next few months. Glass shows no change. Larger shipments from Belgium are at hand, but these, while relieving supply to some extent, have had no influence on price. Packing materials are higher, largely on account of paper, which is likely to advance still higher. Textiles are still advancing and latest reports are not very promising. The present cotton crop is likely to be less than average. Spot cotton is quoted at 42c. Tapestries are getting higher each week. Bituminous coal is costing around $14.00 per ton.

Variations in Different Groups

The commodity number for July is 181.87 as compared with 181.54 last April. The weighted number shows a decrease of 2.89 per cent. in the prices of commodities since April. The groups of commodities as at this date show changes from last April as follows:

	Increase.	Decrease.
Lumber		3.8%
Glue	3.5%	
Hardware	2.5	
Finishing Materials		6.3
Glass	No change	
Packing	7.4	
Upholstering	3.1	

As indicating the activity of the industry during the past half year, the following figures show the relation of shipments to normal: January, 83.18 per cent.; February, 96.5; March, 116.6; April, 112.7; May, 103.16; June, 96.02.

At present indications point to a continuance of dullness for several weeks. July orders have been small and buyers are marking time. Crop conditions are good, and form the basis of an optimism which is gradually dissipating the doubts caused by the spring disturbances. Recent reports estimate the Western wheat crop at 300,000,000 bushels and, once this is assured, orders are likely to come in in such a manner as to satisfy all. There is no need for pessimistic thoughts of the future. This is a resting time and practically everyone is glad to have a breathing spell. The outlook is for steady business during the fall and winter.

Co-operate with Cost Accountant

The secretary advised the manufacturers as to the necessity of sending blueprints of all new lines brought out to the cost accounting department at Woodstock, Ont., so that Mr. Ferguson, in charge of this department, would be kept fully advised as to all new lines and designs that are being placed on the market.

Ralph Kilgour of J. W. Kilgour & Brother, Limited, Beauharnois, P.Q., was called on by the chairman, W. J. Anderson, to address the members, outlining the conditions which exist in the East. Mr. Kilgour said that trade conditions in the furniture industry in Quebec were very satisfactory. Business was a trifle quiet in the cities, but in the rural districts the volume of trade offering was remarkably good. He had no doubt but that the Eastern furniture dealer would enjoy a satisfactory fall and winter trade, and looked forward with every confidence to future conditions in Quebec.

R. A. Sproule of R. A. Sproule & Sons, Limited, furniture manufacturers, Ottawa, gave an account of the Ottawa woodworkers' strike, which has just been ended by the men returning to work under the old wage schedule. The two furniture factories in Ottawa were affected along with other members of the woodworking industry. He referred to the great advantages accruing to the furniture industry through

being able to meet together and exchange information, and to how fortunate the manufacturers were in having such an efficient organization.

J. A. Minchner of the North American Furniture Co., Limited, Owen Sound, Ont., gave an outline of the strike which had recently taken place in Owen Sound. He stated that it had been of brief duration and that the men had accepted the terms that were offered before they went on strike. A tribute was paid to the services rendered by the fairwage officer from Ottawa, who had advised the men to return on the terms held out.

Outline of Publicity Scheme

The chairman next called on Mr. Cawkell for a statement of the progress that had ben made in organizing the newly-formed Publicity Section. This department is to be known as the "Home Furnishings Bureau," and is to be an educational and advisory service for the attractive furnishing of Canadian homes. The services of this department are to be directed by Mr. Wm. Cawkell. T. Lyle Blogg has been engaged as advertising manager and the James Fisher Co. of Toronto are to act as publicity agents. Steps have been taken to secure larger and more suitable premises and it was anticipated that they would be in a position to actively undertake their publicity work by September 1st. The service will be broad and comprehensive in its scope, both the manufacturers and retailers will be consulted and the work conducted in the best interests of all concerned and with the greatest possible economy consistent with efficiency, bearing in mind that true economy can best be secured by efficiency.

James Fisher, of the James Fisher Co., Toronto, advertising experts, gave an interesting address, outlining the publicity work. He illustrated his talk with a large chart, which showed clearly the aims of the publicity bureau and its different fields of activity. The campaign is to be known as the "Better Homes Campaign," and is to be carried on by the Home Furnishings Bureau. The ideal aimed at is the "improvement of Canadian Homes," and the work will be carried on under the slogan "Better Homes Mean Greater Happiness."

Scope of Publicity Campaign

Work will be done in four fields—with the manufacturer, the traveller, the retailer and with the consumer. The work among the furniture manufacturers will consist of: (1) Talks to the manufacturers, showing the possibilities of the propaganda and what has been accomplished in other lines by advertising. (2) Letters to the furniture manufacturers, outlining plans and keeping them informed as to the progress of the campaign. (3) Inducing the manufacturer to use in all advertising and on letter heads, etc., the slogan: "Better Homes Mean Greater Happiness," so as to link the campaign together. (4) Encourage the manufacturers to get out booklets of their own for circulation among the public. (6) Suggesting that the manufacturers should post their artisans about the campaign so that they will take greater pride in their work.

Suggestions for carrying on the propaganda among the travellers consisted of: (1) Each manufacturer should call his representatives together and carefully explain the objects of the campaign. (2) The general committee should issue a booklet for the travellers, explaining how they can help further the campaign. (3) Ask the travellers to urge the dealers to put in "better homes" window displays. (4) Arrange a general meeting of furniture travellers and have addresses given, showing how they can help the dealer.

In the retail field the publicity campaign will be carried on as follows: (1) Using trade papers, letters and folders to explain the campaign. (2) Sending retailers folders, containing copies of advertisements used in magazines. (3) Assisting dealers through articles in furniture publications on "Improved Selling Methods" and "Window Display." (4) Educate dealers to improve their local advertising and to adopt the campaign slogan "Better Homes Mean Greater Happiness." (5) Supply dealers with cards and other material for window display. Prizes for best window display. (6) Call dealers together at the different centres and explain the objects of the campaign.

The propaganda to be carried on direct with the consumer will consist of: (1) Advertising in newspapers, farm journals and magazines, using the campaign slogan. (2) Preparing articles on "Home Improvements" that magazines and farm papers would be glad to publish free of charge. (3) Encourage magazines to boost home improvement by furnishing them with the cuts of the different classes of furniture for free publication. (4) A competition might be launched offering prizes for articles and essays on subjects connected with home improvement. (5) Encourage speakers at Women's Institutes to give talks on "Home Improvement," and furnish them with suitable material. (6) Encourage manufacturers to get out booklets of their own for distribution among the public, showing lines of better furniture. (7) Have general book on "Better Homes" prepared for circulation among the public.

At the conclusion of this address the meeting passed a resolution endorsing and approving the plans submitted by the Publicity Committee, which had previously met with the approval of the Executive Committee, which had previously met with the approval of the Executive Committee. This concluded a very profitable and successful meeting.

Where is Your Organization Weak?

A classification of business failures as compiled by Bradstreets follows:

Failures due to	Per Cent.
Incompetence	33.2
Inexperience	6.6
Lack of capital	30.3
Unwise credits	1.9
Failures of others	.9
Extravagance	.6
Neglect	2.4
Competition	4.2
Specific conditions	13.4
Speculation	.4
Fraud	6.7

An analysis of these figures is enlightening. They show that at least 82.5 per cent. of failures are due to shortcomings of personnel or faults of management in some form or other. The exceptions are failures of others, specific conditions and competition.

There would have been a different story if the management of these business wrecks had possessed those essential qualifications for successful management—knowledge of conditions, foresight and vision.

The successful executive must know the facts; from the facts he must plan with foresight, and further, he must have the vision to discern trends and possibilities that will lead to strength and growth.

A reinforced concrete brick-faced plant. In this particular building the left five bays, added after the original construction, were designed to match the older portion of the plant

A Better Way to Build Your New Plant

Fireproof Construction is Profitable Investment—Comfort and Convenience of Employees Should be Considered

By Frank D. Chase*

(concluded from last issue)

CONCRETE cannot be used as economically as steel for long spans, in spite of assertions to the contrary, and it is not economical as compared with either steel or timber construction for light loads. It is an axiom that the heavier the load and the shorter the span, the cheaper concrete is, compared with other types of construction.

Reinforced concrete requires extreme care in its placing, and "eternal vigilance" is the price of good concrete. It is only by means of a very efficient field organization, in both the mixing and placing of concrete, that results which one can be sure of can be obtained.

Combination of Different Types

In almost every industrial plant use can be made of more than one of the three types of construction described. It is frequently desirable to build a single building embodying all three types of construction, and the most efficient and economical building is the one in which is used the type or exact combination of types which will give the most efficient results for the least cost. In other words, it requires engineering judgment to determine which type of building is best suited to the purpose for which a plant is to be used. An intelligent architectural treatment of the buildings, suiting the style to the occupancy, can produce structures which are not only useful and economical, but beautiful as well. A steel structure can be built to-day practically as cheaply as one of wood. This is particularly true where cranes are to be used. If properly designed a steel structure is, of course, durable and rigid and will withstand any fires which ordinarily may occur within or adjacent to the plant.

Non-combustible roofs are desirable and may be made of gypsum or concrete tiles, upon which is placed a covering of "tar and gravel" or other roofing. Adjacent to any interior heat hazards only strictly resisting roof should be used, and on all sides of a building where other buildings are close by, wire glass in steel sash should be used, instead of plain glass. Flames which might penetrate the latter will be kept out by wire glass. If wood is used, heavy posts and girders and at least two-inch roof plank are no more expensive than a closer spaced, lighter construction. No substantial building should have a one-inch plank roof.

Fireproof Construction Preferred

A steel non-combustible building with tile fireproof roof does not ordinarily require the carrying of insurance other than for wood sheds, offices, etc. It is a simple question of mathematics to prove that the saving of insurance over a period of four or five years

*Frank D. Chase, Inc., Industrial Engineers, Chicago, Ill.

will pay for the additional cost of fireproof roof over one built of timber joists and with plank sheathing; and a fireproof building without insurance is preferable to a building which is built largely or partly of wood and which is covered by insurance. In other words, it is better to have a plant which will not burn than one that may burn, as we know that insurance does not pay for the loss of business and seldom replaces the plant. A fire is always a serious business loss, and when this danger can be avoided without cost, there is no excuse for inviting it.

The style or type of building will affect its success as an operating proposition, and is important as regards light, heat and ventilation, and will determine whether or not the plant is one in which men want to work and can work to the best advantage and with the least handicap of physical discomfort. State regulations are becoming more stringent yearly with regard to the conditions under which men may work, and there is no excuse for a dark and poorly ventilated plant, cold in winter and hot in summer. It is literally poor business, because the men are becoming educated to expect agreeable working conditions, and the plant which does not offer these conditions is becoming increasingly handicapped in obtaining men.

Equipping the Building

The entire mechanical system of industrial plants should be designed with two distinct points in mind—efficiency and welfare of employees. The question of proper heat, light, ventilation and fire protection is equally as important in a modern industrial plant as the building itself, and the co-ordination of such mechanical equipment with the building construction is of great importance. It is essential that such facilities be designed with regard to the particular requirements of the plant occupancy. Local legislation and provincial laws regulating such equipment should also be considered.

All modern heating systems should be designed with a view to flexibility in operation so that the coal consumption can be governed by outside temperatures. The use of a direct radiating vacuum heating system is recommended for low buildings, housing industries which do not encounter serious ventilating problems.

A hot blast indirect system of heating is necessary for buildings having very high ceilings, and in many cases a combination direct and indirect system is of advantage in localities having widely varying outside temperatures. A hot blast heating system is of additional advantage in that it can be utilized during the summer months for ventilating purposes. Hot water and gravity return systems should be restricted to buildings having comparatively small ground areas.

There is a wide difference of opinion among heating engineers in regard to the amount of radiation necessary for varying types of industrial plants. Heat distribution is not a mysterious nor a complex problem in a well designed plant, as the principal governing factors are the frequency of air changes necessary in each department, the relative glass area, the sealing quality of the window sash, and the conductivity of the walls and roof.

Some industries require more ventilation than others. As a rule a building which is properly designed, both architecturally and in its heating facilities, will afford ample ventilation through natural means. Mechanical ventilation, however, is necessary in some instances.

Installation of electric wiring for both lighting and power is governed by the "National Electrical Code," or in Ontario, by the Rules and Regulations of the Hydro Electric Power Commission, and such installations must be designed so as to afford proper fire protection and ample safety to employees.

Modern factory illumination is best accomplished

Interior of building shown on the opposite page. An example of flat slab concrete construction.

through so-called "general lighting systems," using units of from 75 to 500 Watt, type C nitrogen lamps, mounted on or near the ceiling. It is preferable to install single units of large wattage and mount them in reasonably high positions. Drop cords and individual local lighting should be avoided, except in extreme cases where particular operations require them. In some instances a combination of local and general illumination is of advantage. Special attention must be given to efficient reflecting elements that will concentrate the proper amount of light where it is most needed. Various industrial operations require different lighting intensities, and the determination of size, spacing and height of lamps is of the utmost importance.

The ideal arrangement of sanitary conveniences includes a main combination wash, locker, and toilet room with enough supplementary toilet rooms to accommodate the number of employees. Partitions separating the toilet rooms from wash and locker rooms should extend to the ceiling, and all toilet rooms must be provided with outside windows or ventilated skylights. Wash down closet bowls with split seats and flush valves are preferable, and the laws of most States specify that enameled iron trough wash sinks be installed with combination hot and cold water cocks and no stoppers, so that tempered running water can be used for washing purposes. Of all trades entering into the construction of industrial plants, that of plumbing is governed by the most rigid legislation, and the

Clear floor space has been gained by a combination of steel and wood roof construction

regulations in different States vary to such an extent that a careful study of each case is absolutely necessary.

Adequate fire protection is usually a profitable investment, even in fireproof buildings. The distribution of sprinkler heads should receive careful attention, as there are some industries where the breakage of a sprinkler would be a serious menace to finished stock which might be ruined by water. An efficient system of yard pipes, hydrants, hose houses, etc., is almost demanded for the proper protection of modern industrial plants.

Proper Handling of Plant Design

There is no kind of building occupied by man where money can be more easily saved or wasted in its design and construction than a modern industrial plant. So far from being a mere question of four walls and a roof, it calls for skill on the part of the designing engineer to obtain the required results at a minimum cost. There are a thousand and one details in designing and constructing such a plant where money can be saved or wasted without even the knowledge of the owner or purchaser. Specific instances might be cited to show where two buildings almost identical in appearance, varied in cost forty to fifty per cent., due to the difference in handling the details of design and construction. Examples also might be cited of buildings which were so inadequate for their purposes as to make operating costs far in excess of what they should be, and other examples might be given of excessive expenditures for buildings which were far too elaborate or expensive for the required processes. By careful design a nice balance between the expensive and cheap can be obtained to make the economical and efficient building.

The crudest way to build a plant, and one which formerly prevailed, is to give to contractors or steel shops instructions to design a plant and submit a bid. Careful study of the problem and intelligent competition are then difficult to obtain. Under such a plan, usually men are called in to help in designing whose sole object is to sell some material. This method is not, it will be admitted upon reflection, very efficient, and the results are usually disastrous to the man who pays the bills, although in many instances he does not even know that he is paying frequently for materials which are not suitable and which are costly. He gets a building, perhaps a good building, but not the one best plant to meet his operating needs.

The method of Frank D. Chase, Inc., in handling industrial plants, evolved through years of industrial development, is a complete service, though a logical and simple one. Always working with a client, it covers, so far as may be desirable, the items here discussed, including location, site, layout, and design and takes entire charge of the construction and equipment of the physical plant. This unification of effort and centralization of responsibility results in a close, harmonious and satisfactory relationship between owner and engineer and produces in a minimum time and at minimum cost a successful plant.

Studying Canadian Conditions

THE Imperial Trade Propaganda Organization, an association of British manufacturing interests for the furtherance of British business throughout the world, is making a strenuous effort to study conditions in Canada with the idea of presenting authoritative information before British manufacturers. To this end, Mr. Theo. Feilden, director-general of the organization and editor-in-chief of the Empire Mail, is on a tour of this country to secure the most reliable data possible in connection with Canadian conditions, financial, commercial and industrial. This information is intended to indicate how trade can be extended between the Mother Country and the Dominion and present an up-to-date and true picture of Canada's potentialities and opportunities. It is confidently expected that, as a result of Mr. Feilden's investigation, British capitalists will not be slow to recognize the possibilities for expansion of their businesses and investment of their capital. Mr. Feilden on his trip will accompany the delegates of the Imperial Press Conference.

The National Boiler and General Insurance Company, Manchester, England, have prepared a useful pamphlet entitled "Repairs to Boilers and Engines by Welding." The illustrations are particularly good.

Pianos and Phonographs for Overseas Trade

Dirth of Musical Instruments on British Market—German Manufacturers After this Business—Requirements of Trade Must be Satisfied —Profitable Field Awaits Development

Manufacturers of pianos and phonographs desirous of making permanent overseas connections should pay particular attention to Great Britain. True, a strong demand for musical instruments exists in other European countries, but the British market, alone, is capable of absorbing thousands of pianos and medium priced phonographs each year. This was clearly brought out during the investigations recently made in the Glasgow district by Trade Commissioner J. Vernon McKenzie.

This business, while available, will not be secured without competition, and it will be necessary for the Canadian manufacturer to produce instruments that satisfy all the requirements, in regard to design and other details, of the British trade. The volume of business offering would warrant the production of special overseas lines. At the present time the German instrument is beginning to come into competition with Canadian and British-made pianos, and there is stated to be but little prejudice against the first-named article.

Large Orders to Be Had

One leading British piano-importing house, with head office in Scotland, will handle a considerable number of Canadian-made pianos during the present year. One of the owners of the business stated to the Trade Commissioner that he had met buyers from all over the world during the last few weeks who could "absorb" at least 2,000 Canadian pianos if they could be guaranteed deliveries at the prices prevailing at the present time. Of course, to secure all this business early delivery would be advantageous, but there would be a good chance to secure a considerable proportion by deliveries some months or a year hence, if only a specific date for the delivery of, say, 50, 100, or 500 pianos could be settled upon and rigidly adhered to and the price guaranteed.

It is interesting to note that the British importer referred to got in touch with these piano buyers at the Canadian Industries Fair, which was held in London in June. He met there buyers from nearly all the British Dominions, and also from a few foreign countries, Greece in particular. The Greek firm does not ask for credits, but is prepared to pay c.o.d., and even willing, in case of early deliveries, to arrange a credit in London. This importer points out that Canadian manufacturers are not likely to come into direct contact with a large number of these potential customers, unless they meet them in the United Kingdom. These buyers in the majority of cases have not thought of looking to Canada as a source of supply.

Efforts Others Are Making

One of the leading German firms at present placing their products on this market is Ernst Kaps, of Dresden, who has been in the piano manufacturing and exporting business since 1858. His circular, issued to the piano trade, is apparently being sent broadcast throughout the civilized world, and a copy which has reached the office of the Trade Commissioner for Glasgow is an example of good advertising which might well be followed by Canadian exporters of other lines as well as pianos. This sheet shows seven cuts of very handsome models, and they are much more in accordance with British design than practically all Canadian pianos. Under each model the size, wood and the nature of the finish is given in four languages —German, French, Spanish and English. At the bottom of the sheet appears this paragraph in English:

"All grand and upright pianos are overstrung, have 7¼ octaves from A to C4, finest ivory keys, gold enamelled iron frame, metal wrest plank, patent checaction, etc. Slight variations from the drawings are reserved. Copyrighted."

This paragraph appears at the top of the sheet in German, in French on the left, and in Spanish on the right.

Must Conform to Requirements

One particular difference between German and English pianos on the one hand, and Canadian pianos on the other, is that the former have that part of the wooden frame at each end of the keys rounded, while the Canadian-made pianos—at least those that are being sent to this country—are squared. In addition, a study of seven cuts as shown in Kaps' advertisement to the trade, will show that the panelling is much more artistic than seen in many Canadian-made pianos. It may be mentioned that this piano is being sold here at just about the same price as Canadian pianos of similar quality, though how long it will be before this price is lowered when the Germans reach a larger production and get back more closely to a pre-war basis, cannot be foretold.

Piano importers urge very strongly that Canadians take note of certain points in German as well as English piano models, and in order to build up a large and permanent trade in this way, adopt whatever the buyer here demands or prefers.

It may be mentioned here that 300 Canadian pianos from one firm will, in all likelihood, be imported into Scotland during 1920. The Canadian makers manufacturing this piano have very wisely allotted a percentage of their factory output to this territory, and are rapidly adhering to this plan, despite temptations which may arise owing to any demands from the Canadian piano-buying public. The representative of another well-known Canadian company recently made a business tour throughout several of the leading Scottish cities, and reports that he was able to place pianos very readily with Scotch retailers, their only complaint being that they could not get larger deliveries.

It seems to be the concensus of opinion of the trade that the pianos which can be sold here to the best advantage should be placed on the retail market at about £115, or considerably less if possible. A Canadian exporter of gramophones recently showed to the trade here a large number of very artistic models running from £35 to £40 to more than £100. He has been very widely informed that the best selling models should be from £40 down to about £25 for cabinet machines. Table models are much cheaper and more popular.

Production System for Woodworking Plants

Keeping Records of Work Going Through Different Departments—Convenient Form of Chart Giving Full Information—Foreman Responsible for Reports—Trucking System Important Item

By L. F. Simpson*
(Last of series)

In fulfilling its proper functions it is necessary for a production department to, at all times, know how the various component parts are progressing through their different stages of manufacture. In order that this information may be immediately available and may be used to advantage a "Record of Work in Progress" should be kept.

Let us start with the veneered parts passing through the veneering department and follow the course of construction of the cabinet. (In a previous article we intimated that we were applying this production system to the manufacture of phonographs, but that the same principles could be adapted to any line of woodworking). The panels, doors, tops, motor boards, etc., are built up in the veneering department, properly seasoned and sent to the machine or mill room. At the end of each day's work a report is made out by the foreman covering the quantities of panels, doors, etc., made up or worked on during the day. This report is made in duplicate on a 5 in. by 8 in. form, the original going to the production department and the copy to the factory superintendent. In the production department all information received from department reports is filed so as to be accessible for immediate reference and comparison of each day's output. A convenient and efficient method of keeping close tab on production is to have these reports entered each day on a large chart or black board similar to the one shown in the accompanying sketch. Where the wall in the office of the production manager is suitable, it is common practice to have this chart painted on the wall.

Let us examine this chart for a moment. If you follow the departments from left to right as shown by the headings you will follow the cabinet through its different stages until finally packed, ready for shipment. From the veneering room the work goes to the

Figure 1. Sketch of Production Chart

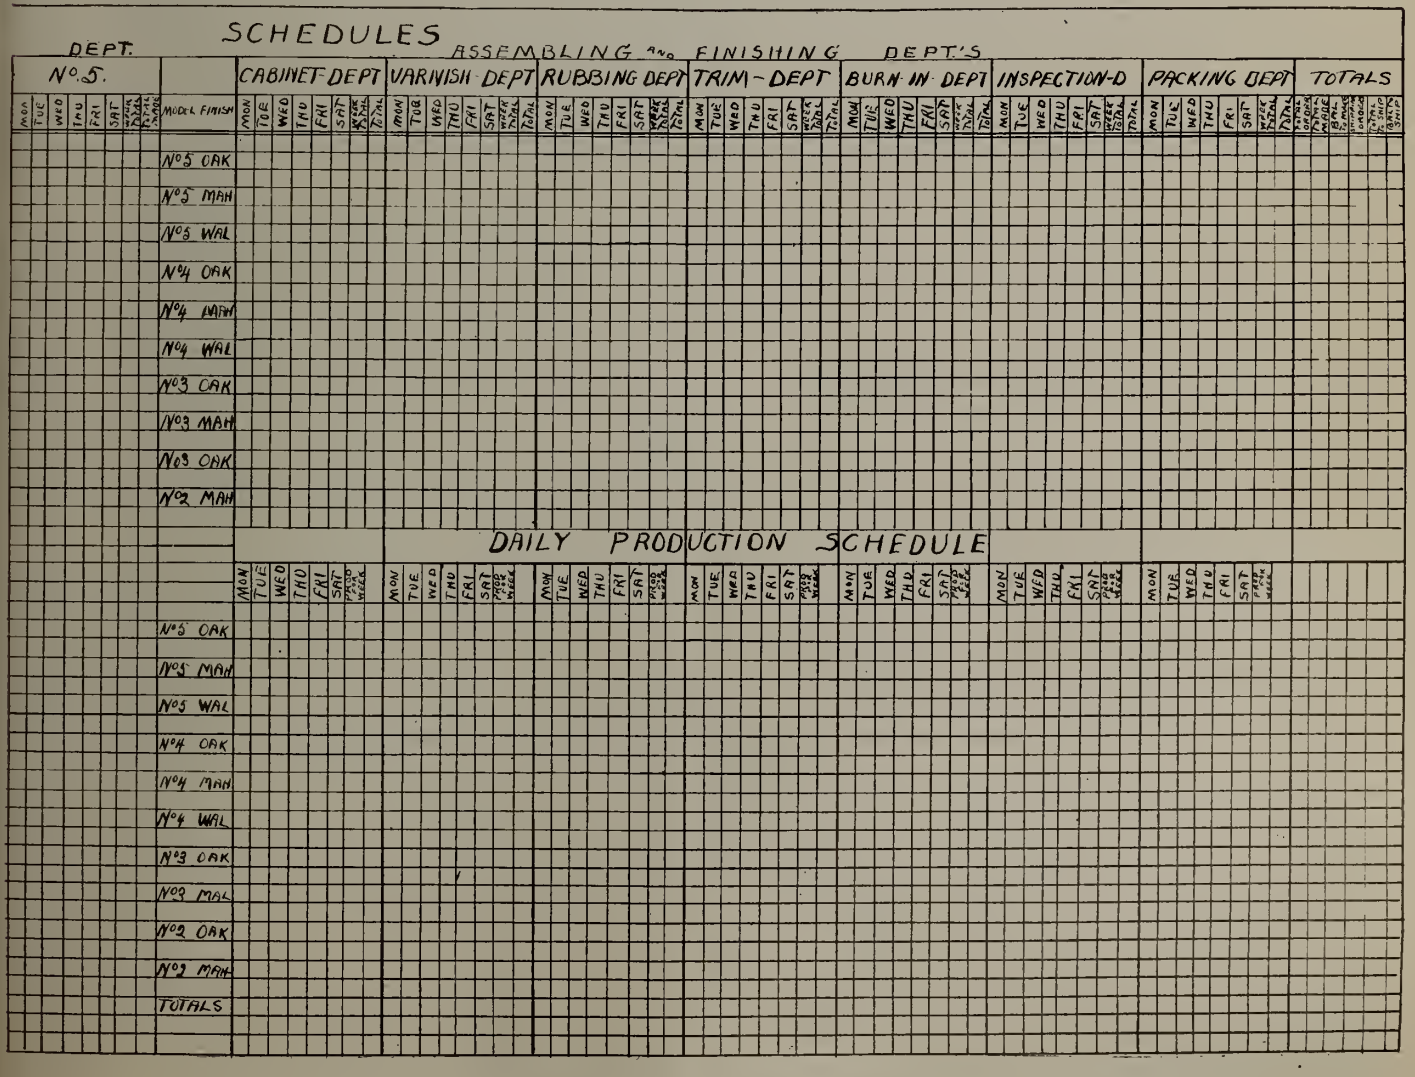
machine department where it will be noted that the work done and quantities of parts are recorded, at all times, from the breaking out saw to the final inspection. A 5 in. by 8 in. card, known as a word card, is used, and in Fig. 2 it can be noted the kind of information that is recorded and used in keeping records of production. If at any time a quantity of any particular part is to be rushed through a part lot work card is made out which follows the special order to its completion. The original card bearing the number of pieces sent on stays with the larger lot. One work card covers only one kind and one lot of any part. As all work is inspected before leaving this department the total number and kind of items produced during the day's work is recorded on the inspector's report, from which production records are obtained.

After being inspected, all the parts are passed into the stock room. Here a record is kept and requisitions made for all stock issued to the cabinet room. The different parts are usually issued in sets of 25, 50 or 100 or in sets comprising all the parts required to make up a sub-assembly or cabinet.

A sub-assembly might be composed of either the two back posts and the back gable of the cabinet or the two front posts, the bottom, centre and top rails or some such units that can be assembled together more conveniently and quicker by one lot of men, because one man does not have to handle so many parts and therefore makes fewer unproductive movements. No doubt there are arguments for and against this method, nevertheless it has worked out to good advantage in cabinet assembling.

A record of these sub-assemblies is kept by the foreman for this information. These all go into the complete assembly of the cabinets, various groups of men doing one operation. For instance, one group would set up the skeleton, such as the gables, posts, rails, etc., the next would add the motion boards and horns, another would place the record shelves and so on until the cabinet would be completed in the white. Each case is numbered at the first operation or when the skeleton is set up and this number is the means of identifying a particular cabinet throughout the various departments. All component parts such as tops, doors, fronts, etc., bear the same number as the cabinet to which they belong. The report from the cabinet department, made out by the foreman, would indicate the total days production of cases absolutely completed, the superintendent getting one copy and the production department the original.

The cabinet after being thoroughly sanded and cleaned passes on to the finishing department. Oak finished cabinets go directly into the fume room to be thoroughly saturated with ammonia fumes then sanded, stained, dried, sanded again, varnished, dried, sanded a third time and finally waxed. During all these operations a record is kept by the foreman and his assistant, and a report made to the production department each day. The same record record is kept of walnut, mahogany and the different finishes as



Original size twenty feet by six feet six inches

Showing trucks with racks for handling small parts in finishing room

they pass along through their particular process of finishing.

All cases requiring satin finish are passed on to the rubbing repartment, where, in the same systematic way the tops, doors, cases, etc., may be rubbed by groups of men, with the foreman keeping the record as the parts pass along and reporting each day the results. Oak finished cabinets pass directly from the finishing department to the trimming department where doors are hung, tops located, and all trimmings put on, motors installed, and in the same way a record is kept by the foreman and reported each night.

When all parts are assembled and practically ready for final inspection they pass to the burning-in or touching-up department where all scratches or other marks, caused in handling cabinets while passing through the different operations, are removed. Again the foreman is responsible for the report of his daily production and advises each night his results to the production department.

The cabinets, touched up and practically ready for shipping, is finally inspected, the motor tested and any defects repaired. The inspection is done entirely by the inspection department who keep tab of the numbers of the cases and make a report each night. This is the final operation on the cabinets and they are then passed on to the shipping department when they are packed ready for deliveries. In the shipping department a record is kept of all cabinets received, with their individual numbers and the numbers of all shipped out. Shipments are made on written shipping orders from the production department.

A very important phase entering into the course of the cabinets through the factory is the handling or trucking from one operation to another and from department to department. Much time, and therefore money, can be wasted without the proper facilities for carrying cabinets or parts from one place to another. One instance of where good trucking facilities help materially is in the varnishing room, where so many parts have to be hand'ed and handled carefully so many times. The tops, doors and cabinets all have to be varnished or stained separately and taken in and out of the drying room. If then, each part is carried individually, a man looses more time travelling from one place to the other than he actually spends on productive work. To overcome this loss trucks properly equipped with racks may be constructed at a reasonable cost that will pay for themselves in a very short time. Trucks shown in the accompanying photo will enable one man to handle 10 to 100 times as many parts, and an ordinary laborer will answer as trucker as your expensive varnishing man. This naturally will assist materially to increase production and lower costs. Ordinary four wheeled trucks or better still elevating or lift trucks, with suitable platforms, are a great convenience as well as saving time in handling parts in the white through the machine room and on into the cabinet shop.

An organized inspection department of comparatively few competent men will add materially in saving the time of the workmen in the assembling department. If for instance all component parts making up the cabinet are inspected before leaving the machinery department, for dimensions and quality, your cabinet makers will not have to fit pieces, nor cull them out, at least to the extent that they would without inspection. Of course the inspection department does not do all the inspection. Each foreman is held responsible and must see that his work is done in the best possible way. In a large factory it is impossible for one man to cover every thing even in his own department.

In the machine, cabinet, final finishing or touching-up departments, inspection is required. It is also well to inspect all motors before assembly into cases. One man, the chief inspector, covers all departments and is responsible for his daily reports in each case, made out on a special form and sent to the production department.

Value and Application of Standards

Units for Measuring Accomplishment and Efficiency Termed Standard Hour —Used to Compare Productive Value of Men, Machines and Plants—Industry Should be Standardized

By James J. Martindale*
(First of series)

That which is set up and established by authority, custom, general consent, or performance, as a rule for measure of quantity, weight, extent, value, quality or performance, is known as a standard. Many such standards were set up years ago. The ancients had their cubit (20.63") and digit (.729"), while we measure length in feet or inches. The Egyptian hon equalled an approximate volume of 29.2 cubic inches. Sacajawa, the intrepid Indian girl who piloted Lewis & Clark across the continent, told them the "Big Water" (Pacific Ocean) was so many "Moons" or "Snows" away.

On the North American Continent, athletic records have been the measure of standards in sport for a number of years. In 1888 a standard of ten seconds for the 100 yard dash was set up by P. Westing and since that time one has to be in the ten second class to be selected for competition in any of the crack events at that distance. A. C. Kraenzlein, that wonderful Penn athlete in 1898, set a mark of 23-3/5 seconds for the 220 yard hurdle which has stood until to-day. J. P. Jones of Cornell in 1913 ran the mile in 4 minutes 14-2/5 seconds, and this standard has not been exceeded as yet. Geo. Goulding, the Canadian, probably the most wonderful walker who ever lived, established many records, one of which is the one-mile walk in 6 minutes 28 seconds.

Invaluable as Applied to Industry.

All manufacturing results should be measured by standards in order to determine the degree of accomplishment. Many plants to-day have rather complete standards set on their activities, but there are hundreds, perhaps thousands, of establishments where standard times and standard hours are unfamiliar and undefinable terms.

Standards of to-day may last for years, yet owing to change in methods or improvement in operation they may have to be set up anew. The athlete is continuously bettering his performance. This is due to a number of causes such as a better breed of athlete brought about by improved living conditions, greater knowledge of fool values and the best way to raise the child to manhood. It is also partly due to better training methods and the knowledge of the one best manner in which to run, jump or hurdle which manner is based upon the past performances of the champions.

A standard on sanding phonograph cabinets or the operation of a glue machine or squaring saws will probably be representative for many years to come unless some radical change in methods or equipment take place. Such a mark once set will allow of a daily or payroll period, or monthly period comparison to be made of the output of the particular activity and such a comparison is a just one, as it is based upon facts and study.

Standard Hour Comparative Basis.

The Olympic games' results can be used as a mark to equal or better in all countries of the globe. In the same way manufacturing accomplishments translated to standard hours is a figure comparable to a similar standard hour figure of a plant in another country.

The monthly production of packing industry in Canada where various kinds of meat are packed can be measured in one figure—namely, standard hours. The output of a sister concern operating in the United States and packing the same kinds of meat can be converted to standard hours. Thus a just comparison of the accomplishments of the two plants is obtainable. A comparison in canned meat by gross or dozens, or boxes is not just. This is so because the standard times set on the vairous operations necessary to can meat will take into consideration all essential factors controlling the work in each country. The multiplication of quantities of output, in various kinds of meat, and the standard times applying to the respective classes of output furnish a result in standard hours.

In a certain wood shop making chairs the production department received considerable censure due to the fact that the output of a sister shop on chairs was somewhat greater. Upon investigation it was ascertained that the second shop did not make all the chairs under discussion—certain details of construction were carried out in another plant. If both shops had been on a standard hour basis and the output had been measured in standard hours, comparisons could have been conveniently and justly made. Upon investigation it was shown that the first shop was turning out more production, but before this information was obtained there was considerable disturbance and jealousy.

Figure Representing Efficiency Obtained.

Having the relation of the standard hours of output to the actual hours of work, an efficiency per cent. can be obtained which is a figure comparable to the efficiency per cent. of a similar plant.

There is no real obstacle to the development of standard times in practically every department of a shop and the consequent obtaining of standard hours and efficiency figures applying to each department and the plant as a whole. These figures are a true measure of accomplishment. They form the basis of praise or censure—raise in pay or discharge. They show up weak points in the chain of production and measure the results due to the application of an intelligent remedy.

Unfilled business can be translated into standard hours and charged to the various departments. If a certain department is running 80% efficient and the standard hours lined up in new work is 16,000, then the actual hours of work ahead of this particular activity is 20,000. With a department payroll of 50, the time required to complete this output is approximately 8 weeks.

Presuming it to be essential that the department in question make delivery of its part of the factory output in five weeks—the necessity is immediately apparent to radically increase the production of this particular

*James E. Morrison Co., Industrial Engineers, Detroit, Mich.

department or cancel some of the business or put the burden of "kissing off the customer" on the sales department.

Transportation Systems Standardized.

For many years transportation on rail has been standardized. This was undoubtedly necessitated by the demand for safety as well as interchangeability of rolling stock. The equipment of the passenger car to-day is of a standard nature from the wheels to the roof covering. Each road, it is true, may vary its models to suit its own particular conditions, but in general the size, weight and kind of wheels, axles, trucks, journal boxes, etc., are standardized for various types of rolling stock. Track construction is quite similar on the various roads. The weight of rail and the disposition of ties and depth of ballast are practically the same on the New York Central, Pennsylvania and other high-class railroads of the country.

Safe running time is standardized. The famous Detroiter of the Michigan Central Railroad on its flight across Ontario from Windsor to St. Thomas, has a schedule time of 118 minutes for 109 miles, and it is seldom that this speed is not made. The Broadway Limited of the Pennsylvania and the Twentieth Century Limited of the New York Central have a standard running time between New York and Chicago. The fact these trains, as a rule, make their schedule is evidenced by the reliance placed upon their arrival at destination by the big business men of the country, to whom minutes are of importance.

Industry must be standardized. This is an easier job than the standardization of railroads, yet it is a big job. It has been postponed because of the failure to realize the enormous possibilities existing in its accomplishments. The North American continent is the birth place of the real industrial engineers, and this is his work whether he be in professional life or the member of a manufacturing organization.

Warm Weather Has Effect on Production

Efficiency of Workmen Greatly Reduced thus Lowering Output---Circulation of Cool, Dry Air—Varying Temperature and Humidity Gives Best Results

Every summer industrial production is cut down by the coming of hot weather, a loss which is preventable, according to a medical expert, writing in the New York Times Trade Supplement, who adds that in the present state of diminished output no effort ought to be spared to prevent waste, and he points to what has been done in this direction in the cooling of stokeholds of ships.

It must first be recognized, he says, why hot weather at once reduces the output of work. The skin is a sensitive organism supplied richly with blood vessels and nerves. These nerves are so arranged that they respond to changes of temperature by opening or closing the small vessels of the skin. When the weather is cold the small vessels are kept shut and the blood is driven inward, so that little heat is lost. When the weather, on the other hand, is hot, the small vessels are opened wide and the skin flushed with blood. Heat is thus lost and the bodily temperature kept cool. In addition, in hot weather the sweat glands become active and the evaporation resulting cools the skin still further.

"It is manifest," continues the expert, "that if the hot person is working in a room which is enclosed, or in a factory which is 'airless,' the atmosphere will be unable to absorb heat from the body. If, in addition, the room is damp the perspiration will not be absorbed. There will, in consequence, be a further effect of heat, and the small vessels will open still wider in an attempt to bring still more blood to the surface.

"The immediate effect of this on the worker is that he feels profoundly uncomfortable, and is, moreover, rendered weak. Blood cannot be present in bulk in two places at once. If it is congregated in the skin it cannot be congregated also in the brain and muscles. Hence there is a sense of weariness and exhaustion. If the process is carried further still this condition may become serious and lead to what is called 'heat apoplexy.'

"Now it is manifest that a man whose bodily effort it is to cool himself and whose blood is mostly in his skin is not likely to do good work—or, indeed, to attempt to do it. This state of matters has often been put to the test and the 'summer fall' of output is a commonplace in many industries.

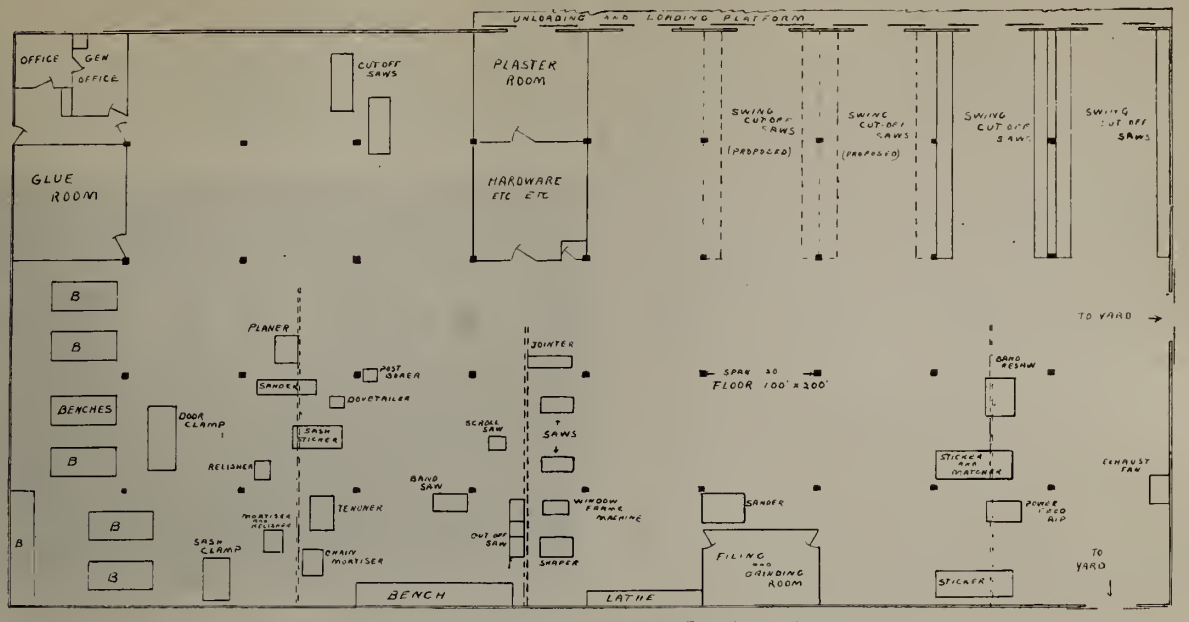
"Cooling depends on two main factors—humidity and air currents. The ordinary thermometer measures the temperature of the air. The wet-bulb thermometer determines the humidity and gives an important measure to the facility with which the body can be cooled by sweating. Further information is obtained by the use of an instrument known as the 'Kata thermometer,' which measures the rate of change of temperature— as the human body does. As a result of many experiments it has been found that a desirable working atmosphere should be, first, cool, rather than hot; dry rather than damp; diverse in its temperature in different parts and at different times rather than uniform and montonous, and moving rather than still.

"The explanation lies in the fact that the moving cool atmosphere stimulates the skin and carries away the heat. There ought, therefore, to be in every shop and office a number of connections with the outside air. The shape of these must necessarily vary. They may have to be windows, but this is only a makeshift at least. A good type in large buildings is produced by openings between the wall and roof.

"If previous experiments have been carried out there should be no difficulty in arranging fans in such a way that a fresh and stimulating atmosphere can be produced at short notice without any hurricane effect. Thanks to modern inventions, fans of all kinds are available, so that it is comparatively easy to have the cooling arrangements made perfect—especially in shops and offices where the employees work in fixed positions."

A saw with only one-third of its teeth doing their work, is equal to one with teeth five or six inches from tooth to tooth. Of course, it depends on the size of the saw.

When a man is hammering with a sledge hammer on the end of a piece of wood which is stuck in the moulding machine, it is as well to keep out of range of the cutters in case one of them flies off.



Layout of ready-cut house plant at Peterboro, Ont.

Specializing in Ready-Cut Houses

First Unit of Large Peterboro Factory in Operation—Careful Planning and Extreme Accuracy Demanded—Initial Output Two Houses Per Day

The three main factors entering into the construction of a home are time, labor and material. It is claimed that these items may be conserved by having all the lumber items for a house cut to accurate sizes at the mill or factory, as embodied in the ready-cut method of house-building. The principles involved, viz., the standardization of parts and the cutting to size and machining of all pieces at the factory are not new, as they have been employed in steel construction work for many years. It is more a question of adapting these principles to wood construction and educating the general public to the savings and advantages that may be effected by their adoption.

The ready-cut method should not be confused with the portable or sectional house idea. The two are entirely dis-similar in construction. In sectional or portable house work, the house is built up in sections which are nailed together at the factory. The sections are shipped out and assembled and bolted together on the site. In the ready-cut house idea each piece is cut to size and length, bevelled or notched, as required, at the factory. The carpenter does not have any cutting or fitting to do, but simply follows instructions and assembles the pieces as directed. In appearance and construction the ready-cut house does not differ from the type of building regularly adapted for residential purposes. Ready-cut houses may be built in all wood, brick veneer, stucco and wood or brick and wood.

Modern Factory Put Up

The Canadian Aladdin Co., Limited, with head office at Toronto, Ont., recently completed the first unit of the large factory which they contemplate constructing at Peterboro, Ont., for manufacturing ready-cut houses. In addition to the Peterboro plant, this company operates branches at St. John, N.B., Brantford and Guelph, Ont., and Vancouver, B.C.

The new factory is a modern, up-to-date woodworking plant equipped with the latest, labor-saving, production machines.

The first unit is a one-storey building, 100 ft. x 200 ft., of frame construction, with heavy concrete floors. The ceiling is high and the whole floor well lighted by a bountiful supply of natural light. The equipment is carefully spaced so that a large volume of work may be put through without over-crowding or confusion.

The site consists of about 13 acres, with excellent trackage facilities. A siding, 700 ft. long, runs through the property and gives connection with the C. P. R. and C. N. Rys. The factory is located on one side of this track and a large warehouse is to be constructed on the opposite side. The siding also facilitates the handling of the lumber and other material.

Individual and Group Drive

Electricity is the motive power employed, both individual and group drive being used. A steam plant has been installed to heat the factory and dry kilns. The refuse from the factory, which is conveyed by a Sheldon shavings exhaust system to a large concrete vault in the boiler house, will be used as fuel. The dry kiln, which adjoins the boiler house, is a single-compartment, progressive type kiln, 20 x 40 ft., and was installed by Sheldons Limited of Galt, Ont. This is a general-purpose kiln and may be used for both hard and softwoods.

The factory equipment consists of the following machines: 4 Cowan swing saws (4 others to be installed later); 2 Cowan cut-off saws with sliding table,

Yates moulder and matcher, Cowan power feed rip saw, American triple drum sander, Cowan 4-sided moulder, Cowan band re-saw, 16 in. jointer, 2 cabinet saws, 1 C.M.C., 1 Cowan, 2-spindle shapers, Yates band re-saw, Kelly portable electric router for stair stringers, etc., Cowan post borer, Cowan belt sander, 12 in. lathe. Smith & Phillips window frame machine, sash dove-tailer, sash and door relisher, planer, sash clamp, door clamp, chain mortiser and screw veneer presses, together with the necessary motors. The filing hoom is completely equipped with rolls, anvil, band saw grinder, circular saw gummer, automatic knife grinder and special grinder for Shimer heads. The lay-out of these machines is shown on the accompanying sketch.

Work to Standard Plans

A large number of what might be termed "standard plans," have been prepared covering a wide selection of houses and bungalows, ranging from the humble summer cottage to the more pretentious permanent residence. A saving may be effected by working to one of the standard designs, but, if desired, special plans will be worked up to suit the requirements of the purchaser. In this case a small extra charge is made to cover the cost of drawing the plans and working out the details.

The engineering department prepares these plans and also prepares detailed drawings, showing the size and other particulars of each individual item entering into the construction of the house. Each piece or group of similar pieces is numbered or otherwise identified. From these detailed drawings a list of material is made up, which accompanies the drawings to the factory. Smaller lists are then prepared and given to the stock cutters and others who are responsible for preparing the material. As each item on the smaller lists is got out, it is bundled and the house or design number, quantity and size of pieces and identification number or name is plainly marked. Each item is ticked off as finished. The material for each house is kept seperate. Thus all confusion and errors are avoided.

Jigs and Gauges for Accuracy

The material is all worked to very accurate sizes. Such items as joists, 2 x 4's, etc., are dressed to

Cowan sash sticker and dovetail machine in Peterboro plant

standard dimensions, so that all calculations will work out correctly. Steel tapes, jigs and gauges of different kinds are used to insure absolute accuracy. The framing, jack rafters, siding, flooring and other items are cut to sizes, and bevelled if required. The only material that is sent out in random lengths is baseboards, picture mould and similar mouldings, which, owing to the variation in thickness of the plaster, could not be cut to fit.

When the ready-cut material arrives on the job, the work of the carpenters is all laid out for them. They simply have to consult the blueprints and directions, which are furnished, select the material as

Cowan chain mortiser and tenoner in Canadian Aladdin factory

designated by the numbers or other identification marks, and begin erecting the building. Everything is planned and prepared for them. Thus there is no time lost in making calculations, measuring, laying out work, sawing, fitting, etc. The building operations become merely a matter of following instructions and assembling the ready-cut material.

The capacity of the new plant is two complete houses a day. With the installation of 4 additional swing saws, the output can be increased to 4 houses. This form of construction is also applied to garages, barns, stores, in fact to all kinds of buildings now made of wood.

Wood Construction of Shamrock IV.

"The wonderful strength of carefully selected, well-seasoned and properly disposed wood" is emphasized by the designer of Sir Thomas Lipton's yatch, "Shamrock IV" as quoted in an article in a recent "Scientific American" which gives the leading characteristic of this craft.

Although "Shamrock IV" is of practically the same displacement as the cup defender "Resolute," it carries 25 per cent. more canvas or 10,800 square feet, as against 8,650 square feet for "Resolute." "Shamrock IV" is a boat of great initial stability capable of carrying a huge spread of canvas—its spread of sail reaching 170 feet above the deck—and this ability is due, according to its designer, to the "wonderful strength" of the wood. The hull is sheathed with three layers of mahogany, two layers inch thick, placed diagonally in opposite directions at 40 degrees to the vertical, and an outer layer 5/8 of an inch thick, placed longitudinally, the whole evenly distributed. The deck is of birch veneer, 5/8 of an inch thick and the hull is stiffened against distortion by running birch veneer bulkheads at each web frame from the bilge to the deck along each side of the hull. The hull is also stiffened longitudinally by a series of wood longitudinals, about 2½ inches square in section.

The mast, two feet in diameter, is of wood and hollow, as are the other spars. The topmast truck is 145 feet and the top of the clubtopsail 170 feet above the deck.

Working Interior Trim from Fancy Woods

Would it be Profitable to Edge and Face Core with Expensive Stock?—Moisture Content of Material Known Within Narrow Limits—Method Outlined Readily Adapted to Stair Work

By Chas Cloukey

The first and perhaps strongest inducement to adopt the practice advocated in the following paragraphs would be a shortage of the necessary material. At the same time, however, it is generally possible to procure a fair to large supply of veneers in almost any kind of wood required. The handling of this kind of work calls for but two thicknesses of veneer, ¼ and 1/16-in.; the edgings, backbands, stops and such small mouldings would have to be taken from solid lumber.

In the very small mouldings it is possible to substitute some other wood, in many cases, without detracting from the appearance of the work. If the work is to be stained and finished at the mill, such substitution may be carried farther than if the work is delivered in the white. I am not advocating the substitution of cheaper woods for the purpose of saving on the cost, but to enable the mill to complete the work when it has exhausted the supply of lumber, without incurring the serious delay necessary to order an additional supply.

May Mean Big Saving

The second consideration of veneering trim is that of economy. There was a time not so long ago when the price of choice woods was higher in proportion than the cost of labor. And it may be so today if the labor is especially efficient or the job is big enough to make a "quantity production." The methods employed in handling veneering of this kind can easily make the difference between profit and loss on a large job. So let us take up the various illustrations one at a time and see how we would go about veneering them in case we had a large job of this character.

In sketch A we have a plain square-edged casing which has a ⅛-in. veneer on the edges and a 1/16-in. veneer on the face. Suppose we use a common pine, cypress or chestnut core. We plane it to ⅞-in. thick, joint one edge and rip to the net width of the core on a smooth saw. Our edge veneers are ripped to ⅞-in., and the clamps filled with the casing cores and edgings. When they come out of the clamps they are run through the pony planer to 13/16-in. thick and the face veneer applied.

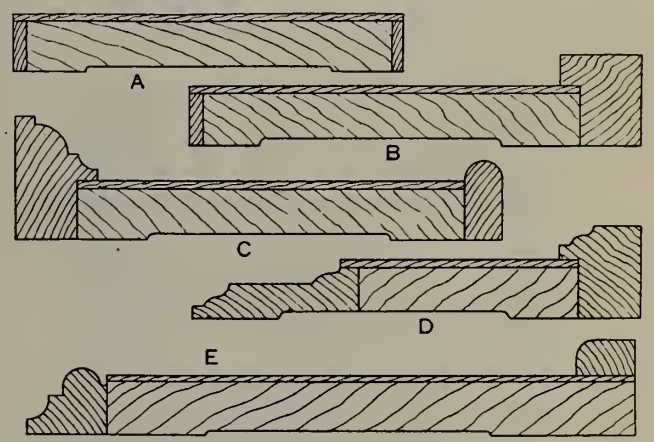
There are many millmen who will say that it is not practical to veneer one side of any solid piece of wood, as it will surely warp out of shape. But a good many millmen have had to back up on some of their old beliefs and accept methods which are calculated to make woodwork behave itself.

Condition of Stock Important

In the first place, the veneer and the core should be of the same humidity, or nearly so; there should not be more than three points difference. By that I mean if the veneer has 7 per cent. moisture, the core must have not to exceed 10 per cent. humidity. If the veneer were thicker, then the difference in moisture would have to be less, as the veneer would not become so nearly saturated with the glue moisture.

To insure a nice straight job, cut strips of wrapping or, better still, building paper and glue on the back side of the casing at the same time that the veneer is applied to the face.

When stacking the casings in the veneer press it is best to turn the faces together and the backs together, as the faces of the cores have been planed level and the backs may not be entirely so. When the casings come out of the press they should be piled on sticks at least ¾-in. thick, and the top of the pile



How expensive woods may be conserved

covered to keep the top layer from curling. If possible, they should stand a week or more for drying and distribution of moisture before going to the sticker.

If the work has been accurate up to this point, especially in regard to the uniform thickness of the core, the sticker will have a very nice job indeed. The top knife should not take off more than 1/64-in., and if this will not remove the feed-roll marks, use smooth rolls for feeding. If there are no smooth rolls for your machine, take some hard maple or birch and turn up some that you can put on in place of the corrugated ones. They will do the work in a surprisingly satisfactory manner; try it. This will leave a little more than 1/16-in. to come off of the back of the casing if it is to finish to 13/16-in. sanded. It is necessary to take a good cut off of the back on account of getting under the paper. No knife will hold an edge for any length of time and cut in paper and glue, but cutting under it is a different matter and does not dull the knives quickly.

Must be Dry Before Dressing

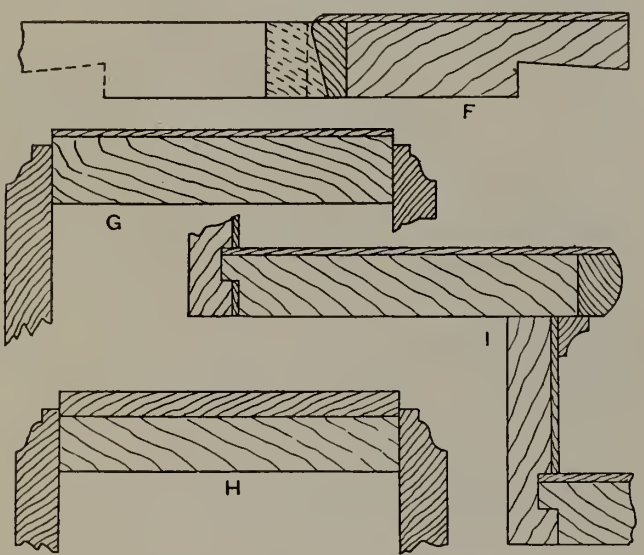
If these casings bend or curl as they come out of the sticker, it is a sign that they have not stood long enough after coming out of the veneer press, so that the moisture is not equalized throughout the piece. The cuts on the edge of the casing will have to be very light—say about 1/32-in.—just enough to trim the face veneer and surface the sides. If this work cannot be done with reasonable accuracy it will turn out to be a botch job and an expensive one. There is nothing really difficult about it; just plain, careful

work, which should be planned out before starting the job at all.

Sketch B shows a casing with backband, which is similar to the first one except that it requires but one edge veneer. This casing is not so particular in regard to width, as the veneered edge can be run next to the fence and the casing brought to the required width by the outside head, as in ordinary runs.

Sketch C shows a head casing in connection with cap mold and fillet. This is one of the simplest forms of veneered casings and does not require the care and skill of either of the foregoing patterns, as it is necessary only to apply the veneer on the face and the paper on the back, to make it ready for the sticker, providing it is straight enough to start with. In case there is much crook in the length, one edge should be straightened on the jointer before putting through the sticker. When jointing this one edge care should be taken so that the jointed edge will run next to the inside of the moulder and the top head knife cut with the grain of the veneer.

It might be well to stop right here and say that when running material which has a 1/16-in. veneer on the face, through the molder, the surfacing knife



Details of stair and interior trim construction

should be back-beveled to insure against tearing out any cross-grained places or lifting blisters.

Judging Width of Paper

Sketch D shows a modified case of veneering in which a wide edge strip is used in order to make the molded edge of the casing. The treatment of this pattern is not different from that of B except that the face veneer is not applied clear across and the paper on the back should not be wider than the veneer on the face. This is important, for if we wet the back of the edge strip with glue and do not do so on the face, the back will swell and that will make the casing cup on the face before we can get it to the sticker. Neglect of these details will produce bad work and spoil so much material that a profit will be impossible.

I neglected to say that the head casing C, would have to have return miters on the ends to hide the core. But in many first-class jobs this is required anyway, so as not to show the end wood.

Sketch E is a base detail and is handled like C except the veneer may be skimped a little at the bottom and still be covered by the shoe. All of the base patterns which the Standard Molding Book shows as being made out of a solid piece with a molded top, may be made like E with the molding made in a separate piece, except the plain round edge and the flat bevel top. These will require an edge strip glued onto the core before the face veneer is applied.

Do not forget to put the paper on the back of the base, for the wider the board the more necessary it is to put the same amount of moisture on both sides of it at once.

Sketch F shows the method of veneering window stool. This should be put up with waterproof glue. If the stools are narrow, considerable time may be saved on a large job by putting in the edging double width, as shown in the drawing; then veneer over the whole and rip in the middle.

Working the Door Jamb

Sketch G shows a simple form of veneering door jambs, and this method applies only where the core or backing is of the same wood as the face or of a wood so similar that the small amount showing back of the veneer would not be discernible. For instance, a quartered-oak face can be glued to a common-oak back, or even a chestnut back, if the work is to be stained a dark color. A walnut face may be applied to a red or black gum back if attention is paid to selecting the color of the back. Birch may be used to back up mahogany if the work is to be finished in the mill. Selected red birch may be used with a cherry face, if selected for color to match. Figured gum will go with Circassian walnut, and so on.

Sketch H shows a jamb with thick veneer, which is necessary where it is not possible to use the thin one shown in the previous illustration. In H it would not be necessary to paper the back of the jamb on account of the thickness of the veneer, but it will be all the more important to see that the two pieces are equally dry when glued. However, they must not be too dry. They should contain at least 5 per cent. moisture, or one may swell up more than the other in coming to a normal moisture content, which will be from 5 to 8 per cent., according to the weather and the climate. Oak and white pine will naturally absorb almost exactly the same percent of water by weight, but the pine will swell more than the oak. Therefore, if oak and pine are glued together when both contain only 2 per cent. moisture, the pine will expand more than the oak when they both go to 7 per cent., as they will in damp weather, and they will assume a curve, with the pine on the convex or "hump" side. So the preventive process is to have them as nearly normal as possible when they are stuck together.

Used to Advantage on Stair Work

Perhaps there is no other part of millwork which lends itself to economical veneering with greater facility than stair-work. A look at sketch I will show, with very little comment, how it can be managed. The treads are handled like the window stools, except that they are so wide they cannot be veneered in pairs. The risers and wall strings are handled like the base, and the newels may be veneered in the boards and corners mitered.

When the details shown have been mastered it will be an easy matter to veneer the material for ceiling beams, case-work, mantels and so forth. It may not be necessary to say that the face veneers for casings and other wide veneers should be ripped before

ripping the narrow ones for the edges, although the edges will be applied before the faces. In this way it will be possible to use up the veneers very closely.

If the glue man on the job is not one of experience, he should know that it is necessary to exercise a great deal of care in this kind of work, to see that the edges of the veneers are properly covered with glue and that the edges of the face veneers are under sufficient pressure to insure a joint. It is on this account that I advocate putting the work in the press with the faces together. Careless work in the glue room means many dollars spent in repairing the poor work after the defects have time to "season out."—Veneers, Indianapolis.

Do Your Band Resaw Wheels Need Grinding

Wheels Must be Kept True for Satisfactory Results —Lower Wheel Requires Special Attention

By J. D. GeBott

In preparing this article it is the desire of the writer to bring to the attention of manufacturers operating large or small band mills, the vital necessity of keeping the band wheels in proper condition.

Two of the main features in the successful operation of a band mill are that the mill be kept in perfect alignment and the wheels kept true and in good running order. A machine working on dirty lumber should have the wheels faced off at least every ten or twelve months. Some times a mill will run a longer period, depending largely on the cleanliness of the stock and the hardness of the metal used in the manufacture of the wheels. Then again, scrapers improperly adjusted to the face of the wheels will cause them to wear much faster than the natural wear of the saw.

The lower wheel is usually in poorer shape than the upper one. Nearly all the dirt from the stock drops between this wheel and the saw, thus working away the face of the lower wheel much faster than that of the upper wheel. As most of this wear is on the front edge, the front of the wheel becomes considerably smaller than the back, thereby allowing the saw to run slack on the tooth edge, causing it to lose its efficiency, so that it does not stand up and do the work as well as if the wheels were true and in proper working condition.

When examining a machine to see if the wheels need attention, the usual practice is to look at the upper wheel only, because this is the easier one to get at. If one will examine the lower wheel as well, it will ,probably, be found to be worn two or three times as much as the upper one. When it is found that the top or upper wheel needs grinding one can easily imagine the condition of the lower wheel.

The wheels on a band-mill wear in two places only—on the extreme front edge and where the back of the saw rides on the wheel. These two spots will be found to be low. The back part of the wheel seldom wears as the saw should not run on this part. This being the case, it is necessary to keep the back of the wheel face down to the same size as the front, so that measuring with a steel tape-line, both edges are exactly the same. Some filers and operators prefer to have a slight fullness in the centre of the face of the wheel. This is not objectionable if run in the proper place. Usually a perfectly flat wheel is preferable. Machines having the upper wheel of steel, it is best to have a slight crown as steel wheels are more or less liable to show hollow if ground perfectly flat. This is owing to the contraction of the spokes. On large double-cutting band mills a little crown can be left in the centre of both whels as the saw remains in the same position on the wheel at all times, whereas with a single cutting saw, the blade is gradually worked forward on the wheel as the saw is ground narrower.

To make a good job of grinding band wheels, it is essential that a good grinder be provided and that it is set square and level with the wheel. Level the lower wheel and see that there is no lost motion in the boxes as the shaft should lift firm against the bearings when the strain is on the blade. In practice it is best to grind the lower wheel first. Be sure and see that the grit and dirt is all cleaned off before grinding is started and then grind down the high places first.

When grinding the upper wheel it is essential that the straining device be locked so that there is practically no vibration in the wheel. Strain the saw the same as for sawing. If a blank blade is used, it should

The GeBott band wheel grinder

carry the same tension. All top wheels should have inside scrapers. These can be readily arranged from the upper journal bolts by having them made long and extending down to the inside of the wheel, then turned in and flattened so as to allow a brush or stiff piece of leather to be attached. This will keep all sawdust from collecting on the face of the wheel, and will tend to keep the wheel clean and in perfect appearance. When this is done, there is no dirt to fall from the wheel when the machine is stopped to change blades.

The wider the saws, the more attention must be given to the condition of the wheels. This is in order to get a good cut out of the blade. If the wheels are not in perfect shape, the saw has a tendency to run ahead with a wide over-hang, thus losing a certain part of its cutting capacity. If this occurs one might as well run a narrower blade, as the saw must be kept back on the wheels in order to keep the tooth edge stiff when entering the cut. This is very often the cause of bullheads. The work of the saw filer and the operator is greatly facilitated when the wheels are kept in first-class shape, and in addition more stock will be cut and the work done will be of a higher order.

Advertising Manager for Home Furnishings Bureau

At the general meeting of the Furniture Manufacturers' Association the appointment of T. Lyle Blogg as advertising manager of the newly-formed Home Furnishings Bureau — an educational and advisory service for the better furnishing of Canadian homes— was confirmed. Mr. Blogg is to supervise the advertising which is to be done in connection with the publicity campaign being launched by the furniture manufacturers. He brings considerable publicity experience

T. Lyle Blogg, Toronto, Ont.

to bear on his new position, as he was in charge of the service department of the Hugh C. MacLean, Limited, trade journal publishers, for about six years, in the service department of J. Walter Thompson Co., advertising experts, for one year, and had full charge of the publicity work and dealers' co-operation service of the Pathe Freres Phonograph Co., of Canada, Limited, for a year and a half. Latterly he was assistant art director with Grips, Limited, Toronto. He will assume his new duties on Sept. 1st.

Mr. Blogg is very enthusiastic about the work of the "Home Furnishings Bureau." The possibilities ahead of the bureau are almost unlimited and with the whole-hearted co-operation of the manufacturers and dealers the industry stands to reap untold benefits from aggressive, educational publicity. Early in his work Mr. Blogg plans on taking a trip through several Ontario centres, consulting with both dealer and manufacturer, as the new bureau aims at close co-operation with both branches of the furniture industry.

National Hardwood Inspectors in Canada

John E. Banks, Toronto, chief inspector of the National Hardwood Lumber Dealers' Association in Ontario, is well-known to lumber users. He has been connected with the lumber business for the past ten years and was formerly employed by G. Elias & Brother, Inc., of Buffalo, N.Y., and later by the Hugh McLean Lumber Co. of the same city. Mr. Banks has been identified with the inspection staff of the National Hardwood Lumber Dealers' Association for the past year and a half, being first stationed in the Buffalo market and shortly after being transferred to Toronto, of which market he has now charge.

Arthur G. Bowler, who is in charge of the Quebec District, with headquarters in Montreal, became a National Deputy Inspector in December last. Mr. Bowler was born in 1891 and commenced his connection with the lumber business in 1907 as yard inspector for Parker & Page Co. at East Cambridge, Mass. In 1914 he left that firm to take charge of the yard of the New England Lumber Co., at Charlestown, Mass., He was in the service of the U. S. Government as an inspector of propellor wood for a year during the war.

Before a man can be a first-class machinist, he must live through many years of patient and thoughtful work.

John E. Banks, Toronto, Ont.

Arthur G. Bowler, Montreal, P. Q.

The Forest Products Laboratory at Madison, Wis., which recently celebrated its tenth anniversary.

Successful Celebration at Madison, Wis.

Extensive conservation of the national wealth of wood through more efficient utiliation was the keynote sounded throughout the recent decennial celebration at the Forest Porducts Laboratory at Madison, Wisconsin. Over 200 visitors from all parts of the United States were present, representing every line of wood-using industry, including 59 wood-using associations and companies, 18 lumber manufacturing associations and companies, the Deans of 12 Forestry schools, the United States Forest Service, and other visitors and friends. They came to pay tribute to the laboratory's ten-year record service to American industry.

The Forest Products Laboratory is a government institution of industrial research in wood and all wood products maintained by the United States Forest Service in co-operation with the University of Wisconsin. In this work 220 engineers, wood technologists, manufacturing specialists and assistants are employed in developing new uses for wood and improving present manufacturing methods. Investigations and experiments are undertaken both independently and for individuals and companies on a co-operative basis. Results obtained are disseminated through co-operative reports, commercial demonstration, correspondence, government bulletins, mimeographed circulars, articles in the trade press, and practical instruction courses given at the laboratory.

The programme continued with inspection of the work and exhibits of the laboratory. Guides in charge of small parties showed the visitors the various lines of endeavor in which the laboratory is saving millions of dollars a year to the people of the country. Following the inspection trip was a period of recreation, consisting automobile tours around the city, boat rides, and swimming.

Because you have rubbed a file over a saw, it does not follow that you have made it a better cutting tool.

Can you coil a band saw four times?

Do Not Figure bv the Thousand

W. D. Burr

The mounting price of raw material and the increasing wages paid to employees of box factories emphasize more than ever the fallacy of making prices on boxes at so much per thousand feet. Manifestly a box containing a small amount of lumber requires a greater amount of labor per foot of lumber than one of larger proportions. So it is with a box made of thin material, as compared with that manufactured of 13/16" lumber. Each additional item, such as resawing, cleating, nailing, printing, stapling, boring, matching and the like, increases in direct proportion as the sizes of the boxes decrease.

The consumer is particularly interested in the cost per box, not in the cost per 1,000 feet. The practice of quoting prices on the latter basis is a relic of the past—of the period when lumber values were low and labor was cheap and plentiful. It affords an imporper comparison, it magnifies the spread in price between a large box of simple, heavy construction without extras, and the small well-finished box of more complicated design. So long as the practice continues, just so long will it be difficult to secure a proper price for the box of more expensive construction.

Why not give this subject due consideration and change the practice to meet the new conditions with which the box manufacturer is now faced?

The first airplane propeller of red gum that was ever used commercially was attached to a stranded machine nead Madison, Wis., by the Forests Products Laboratory. An accident had caused the aviatrix guiding the plane to descend in a hay field, and the revolution of the propeller blade while speeding through the timothy caused about six inches to be broken from the ends of the blade. A hurry-up call was sent to the laboratory, and one of the experimental propellers of red gum rushed to the scene. It was attached, and the flight continued. The red gum blade is, apparently, a commercial possibility.

Is Rigid or Elastic Container Preferable?

Exhaustive Tests Indicate Elasticity Desirable Feature—Utilizing Strapping to Best Advantage—Improved Manufacturing Methods Required

By Malcolm W. Hill*

The shipper is interested in the box which combines lowest first cost with maximum reliability under export shipping conditions. A theoretically perfect design would be that in which the materials and the stability of the contents were all so related to each other that all would reach their final state of endurance at the same moment, or collapse of box and contents take place at the same time under a breakdown test. To determine these relations practically is your problem—some tests made something over a year ago which were most interesting and gave matter for serious thought along the lines of reinforcing with metal binding.

Because the type was available by the hundreds, the No. 3 canned goods box packed with 24 No. 3 cans of pumpkins were used in the experiments. The boxes were all allowed to drop measured heights on a concrete floor and in such a manner that they struck on a corner, which was the most severe treatment we could give them. The cases weighed 70 lbs. each, measure 1.6 cu. ft., and the cans fill but 59.3 per cent. of the space within the case, which does not give the internal resistance that another commodity might, but the relative findings should not be affected as the cases and contents were all similar shape and weight except in materials and construction and the types of binding used, which covered all the most well-known makes in commercial use.

The standard commercial canned goods box without straps was given a 6-inch drop and then a 12-inch drop, when the contents spilled, with two bands this same type box stood three 30-inch drops before breakdown, then, note this carefully—by adding a third strap at right angles to the other two or around the ends of the box, this commercial box stood seven 9-ft. drops before spilling the cans. An export box treated the same way, stood a 6-in., a 12-in. and an 18-in. drop unbanded before breakdown, with two bands it stood three 42-in. drops before a board broke, but contents remained intact. It was then dropped from the 9-ft. height, and on the second drop spilled. It stood seven 9-ft. drops after the third band was added. The most important conclusion to be drawn from this test is that the weaker box by the addition of a strap costing a little over a cent placed at right angles to the others stood up about as well as the more expensive export box. These tests illustrate the fact that the very rigidity and hardness of the wooden boxes built to stand heavy loading under compression need additional aid to stand sudden shocks which are delivered at angles other than vertical to the faces of the box. During 1913 a case was tried before the I. C. C. where comparative tests of wooden and wire-bound boxes were made by dropping similar sized boxes 4 ft. and there also the most elastic wire-bound box held its contents after the rigid box had split open. It would seem, therefore, that a certain elasticity in design should be striven for in box design for the lighter loads and this can be acquired by using thinner material with perhaps lighter and more flexible fastenings.

It appears to me that the field for export containers of newer types is very wide, and combinations of standard wooden box designs with reinforcements of light steel angles and punch pressed shapes riveted to the lumber will form a very stable structure with little chance of collapse and with a minimum of weight for cubic capacity. From study of the plants of the box makers, talks with the packers and shippers, and finally from reports from the receivers on the delivery end, we have a lot of very valuable information about boxes and their good and weak joints that will be of great use in the future in designing containers for our export trade.

How to Apply Strapping

To offset shrinkage in wooden cases attempts have been made to stretch strapping so tight that with thin lumber the members are pressed or sprung inwards, with the idea that as the drying out proceeds the spring will take up some of the slack in the bands. This was tried successfully with boxes of special design where the tops and bottoms were slightly narrower than the sides and thus allowed of some movement without interference. Boxes strapped under tension with nailless strapping and placed near a steam radiator for several months remained tight though the lumber was thoroughly dry. The same type boxes were drum tested by Forest Products Laboratory, with the result that the bands worked not towards the ends but towards the middle of the case. With nailed strapping where thin lumber is used it must necessarily be located near the ends to get solid wood to nail to, and here the first stretching is the only means to get the bands tight, and here the bands will festoon if the moisture content of the lumber is too high. As a suggestion for taking up the slack in this last case, it was found that by placing tops and bottoms with a space between the boards that nailing the strapping down between these boards tended to tighten the bands, particularly where a slot-punched type of strapping was used.

The lock corner box has not been as useful in the past as it might have been, partly through poor glues, but the war work resulted in developing many waterproof glues which can be had at commercial prices.

It seems to me that for the more valuable export goods the well built chest type export box with a screwed on battened cover or hinged lid will have served a great need. I have been informed that many such chests of English manufacture have been treasured items of household furniture for many years in some countries, and no doubt the resale value of such a case will be considerable if it is well built and survives its first duty as packing case without serious injury. In case of actual examination by customs officials such a case will offer much less trouble than a nailed one, and will come off with very little damage.

As a matter of business promotion our box makers should be in a position to advise their clients as to the type and the design of export boxes best suited to

*Address before N. C. Pine and Shook Manufacturers' Association, Baltimore, Md.

their requirements. There is no doubt that with export boxes the better drying of the lumber will pay both the mill and the client. The moisture controlled kilns have reduced losses of material in some kilns from 30 per cent. to less than 2 per cent. and study of this subject is so well worth while that it's only a matter of time before the high prices of timber and labor will make this and similar efficiency work absolutely necessary. In connection with the improved glues, the study of laminated construction for export boxes is well worth while.

To laminate lumber for export boxes to the necessary thickness for heavy duty and get thus a minimum of weight with a maximum of strength and toughness will go a long way toward the solution of the problem of excessive tariff charges. The costs of the glueing process has been much reduced by the new methods of manipulating the waterproof glues in which whole stacks of plywood can be glued up at one time. Owing to the demand for better waterproofing, the lock-corner box properly glued and reinforced will make a case which with care could stand actual immersion without damage and offers a valuable field for research. Any buyer of boxes in quantity today can well afford some scientific study in connection with his box requirements and try to determine just what combination of wood and steel will get his shipments to their destinations with a minimum of cost and yet give satisfactory service to his customers. He must try to strike general averages and remember that it is not efficient to box his goods so strongly that they would be pulverized within the case before it would break down.

Standardizing Material

No definite rules for thickness of lumber can be specified to cover all cases, the only thing that can be done is to group the woods into classes that have strong and weak physical properties. The accepted rules for thickness and nailing and the other standard procedure in box building and fastening up should all be reconsidered when the export box is concerned as the very vital matter of strapping the export box may entirely alter the relationship of the materials and rules for the box that is not required to be strapped. It is quite probable that in a short time the use of both nailed and nailless strapping on the same case will be a common occurrence, as both have some features of merit that the other does not possess.

The relation between the first nailing up of a box and the later placing of strapping has not received the attention that it should. The spacing of nails and the later nailing of strapping should be thought out, as in a busy shipping department this saving will mean thousands of dollars annually and less damage to cases through careless nailing.

The matter of clinching nails is too often neglected also the great benefit from driving nails at opposing angles. Another matter worthy of thought in connection with export boxes is the use of screws in covers and in thin board sides. A hand drill with hard wood will enable the packer to use screws without any danger of splitting the thin material if care is used, where nailing would be disastrous. Woods practically unfit for nailing can be used with the drilled screw hole method.

If every person was given what he wanted, would this be a contented world?

Orient Looking to Canadian Box Industry

The following is extracted from a report recently received from Vancouver, B. C.: Among the numerous opportunities offering in the market of the world for British Columbia's forest products, none is of a more attractive or more promising character than the demands now being made in the Far East for all kinds of wooden boxes, needed for the export of the various products of that part of the world. During the past few months enquiries have been reaching the Department of Trade and Commerce at Ottawa and local offices, putting forward the requirements of the Orient in this respect. Orders have already been placed for huge quantities of these boxes, but seemingly, with other sources of supply shut off through different reasons, this province is now being regarded as the best equipped to handle this trade.

A short time ago orders reached the manufacturers of boxes here totalling well over a million and a half boxes. These orders did not all come from the Far East, some of them coming from South Africa and other parts of the world. In an endeavor to meet the sudden demand upon them, the orders were distributed among the various factories in the province, but even this means was not sufficient to meet the needs of the situation and many factories had to accept orders to fill as they were best able.

The mere fact, however, that local factories were able to undertake this sudden rush of business has given this province one of the most far-reaching pieces of advertising it has received for many a day, as has been revealed since then, by the numerous enquiries received from other parts of the world, beside those involved in the previous batch of orders.

China, Java, the Straits Settlements, Ceylon and India are now in the market looking for large quantities of these boxes, for the export of their various products, mostly tea and rubber. One firm is anxious to place an order for 50,000 and it is estimated that for the season of 1920 alone the market will require no less than 4,000,000 boxes.

Alder for Cigar Boxes

There is a steady growing demand for alder lumber It is used for cigar boxes, pulley making, and furniture. Recently there has sprung up a demand for alder from the manufacturers of musical cabinets. Alder takes stain well and is an excellent substitute for mahogany for the cheaper grades of cabinets. Alder is a valuable wood, which up to this time has not been regarded of any great commercial value. It is found growing in damp, low ground and attains a diameter up to 24 inches and in some instances larger, but generally smaller. In western Oregon and Washington there is quite a percentage of land covered with alder, some of which is of considerable commercial value. Small portable mills would provide the most economical plan for conversion. Up to this time alder has been generally regarded as an excellent fire wood.

The fence of a saw bench should be regulated accordingly to the saw. If the saw cuts correctly it should be parallel with it; if incorrectly, it shoud be arranged to correct the regular cutting of the saw.

The technical press is of much importance in any country, as it circulates the knowledge gained by years of experience in all the industrial arts.

Machinery & Equipment

Improved Glue Heater

Most users of animal glue have been convinced that to secure the best results it is necessary that the temperature of the glue be maintained within very narrow limits. High temperatures or repeated heating weaken and destroy the glue so that it quickly loses its strength and adhesiveness. The best, and in fact the only practical method, is to mix sufficient glue each day for the day's work and keep it warmed to a temperature of about 135 deg. Repeated experiments and tests have clearly demonstrated that the best working temperature for animal glue lies between 125 deg. and 145 deg. As soon as the heat reaches the latter figure the glue begins to deteriorate and the higher the heat

Cincinnati Glue Heater

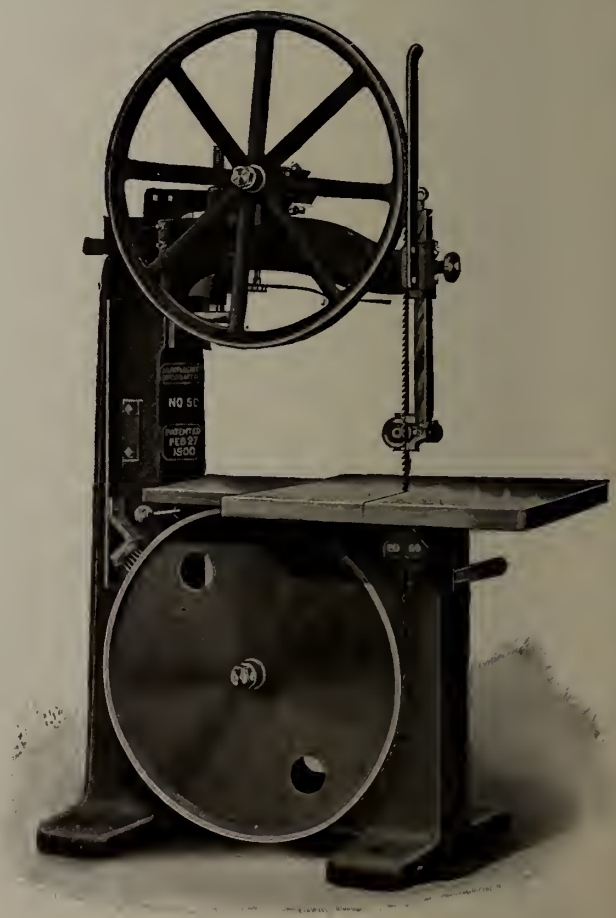
the greater the deterioration. It is difficult for many glue users to tell when their glue has reached th correct temperature and still harder for them to maintain that temperature when once ascertained. The glue heater shown in the accompanying illustration is so designed and proportioned that the temperature of the glue cannot rise above the correct figure. This is not a jacketed heater, the water being contained under the glue chamber. No heat controllers or other safeguards are necessary. The whole secret lies in the fact that the heating surface has been scientifically reduced to a point where it cannot conduct sufficient heat to overheat the glue. The material used is copper. Full particulars may be had from the Cincinnati Glue Heater Co., Cincinnati, Ohio.

Shurley-Dietrich, 1914 Post Boy

The Shurley-Dietrich Co., Limited, Galt, Ont., manufacturers of knives and saws, have recently placed on the market a new band saw, which has some unusual features. The most noticeable point is that the blade is made with two long points or prongs which extend in slots right through to the tips of the handle. This design reinforces the handle so that should the saw fall and strike on one tip the steel blade will take the blow and the point will not be broken. This construction gives a good balance, right hang and comfortable grip. The blade is of Jessop's high-grade steel. The makers will be glad to send circulars describing this and other saws.

Efficient Band Scroll Saw

The accompanying illustration shows a band saw taken from the "Lightning" line of J. A. Fay & Egan, Co., Cincinnati, Ohio. The frame is a single cored casting. The square form is designed to reduce vibration, permitting the machine to be run at a high speed. The table is 29" x 33" and may be tilted 45 deg. to the right and 10 deg. to the left of saw. Wheels 36" in diameter, with 2" face. The lower one is solid, giving greater momentum for heavy cuts. Upper wheel has



J. A. Fay & Egan Band Saw

lateral and vertical adjustments. Roller saw guides are used. The straining device is their well-known "knive edge balance" and is very sensitive. Its action is instantaneous, which should result in fewer broken

blades. A resawing attachment may be secured that will enable boards, as wide as 12" and up to 4" thick, to be resawed. Power required 3-5 h.p. or 7½ h.p. if the resawing attachment is used. Speed 600 r.p.m. Bulletin No. 4 fully describing this band saw may be secured by writing the above-mentioned firm.

Saw guards may be a bit in the way when you want to make a record day's run; still they have saved many men from very serious accidents.

White paint should be used on the walls of the finishing room. It will make the department brighter and enable more work to be produced. Never use cold water paint or white-wash as it is bound to peel off.

Two-Quart Dry-Type Glue Pot

The Westinghouse Electric & Manufacturing Company has placed upon the market, an addition to its line of electrically heated dry type glue pot, in a two-quart size. This glue pot is solidly constructed consisting of a glue vessel of copper contained inside of a steel case. The glue pot may be easily removed for cleaning. This vessel fits snugly, making a perfect

Westinghouse two quart glue pot

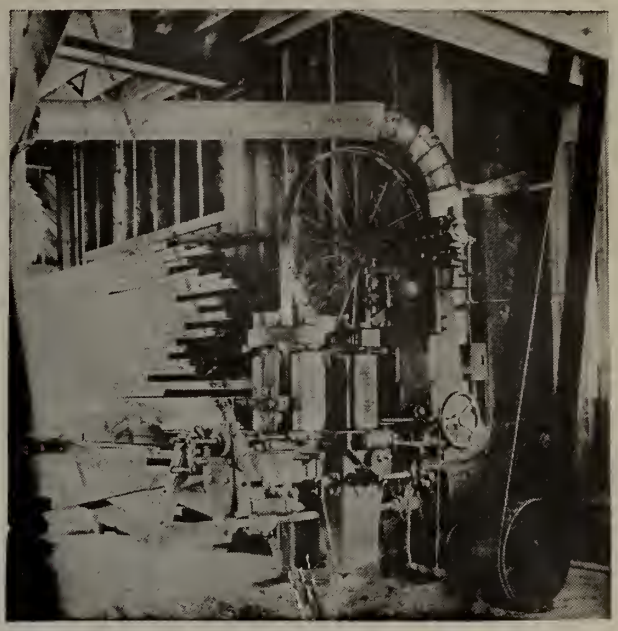
thermal contact with the heating element. The water bath is eliminated and with the dry-type glue pot the current can be applied continuously without any danger of the heater burning or the glue becoming overheated. The single-heat constant input heater gives the correct working temperature to the glue for continuous operation of the dry-type glue pot. Full particulars may be secured from the Westinghouse Electric & Manufacturing Co., Pittsburgh, Pa.

Well Equipped Planing Mill

The Sheppard & Gill Lumber Company, Toronto, Ont., have just completed the construction and installation of an up-to-date planing mill and equipment. This firm, which is composed of L. B. Sheppard, H. L. Sheppard and E. I. Gill, purchased the lumber yard formerly conducted by W. & R. Smith, and have added the planing mill to enable them to handle the large volume of building material required in their section of the rapidly-growing Danforth district.

The mill is a two-storey frame building 48 x 54. The lower storey where the heavy machines are located, has a smooth concrete floor. The upper storey is used chiefly for storing sash and doors, which are stocked in large quantities. One corner of this floor is fitted with a couple of work benches and a C.M.C. No. 317 variety saw, and is used for odd jobs.

The equipment on the mill floor consists of modern production planing mill machinery—the sash and doors are brought in by the carload—and includes the following items: Yates C. 3 moulder, Yates A 4 fast feed moulder and matcher, C. M. C. self feed rip saw, Yates 4 in. band resaw and a Yates No. 137 emery



A Yates resaw in Sheppard & Gill plant

stand. These machines are all new and of the latest design.

Electric power is used, with an individual drive for each machine. Two shavings exhaust systems are employed—one to collect the sawdust and the other to carry away the shavings from the stickers. Separate storage vaults are provided for each material. The layout of the machinery is such that a large volume

Yates fast feed planer and matcher in Toronto planing mill

of work may be handled. The machines are placed crosswise of the building, so that stock may be fed in one side and carried away through doors on the opposite side. The latest style profile heads with milled cutters are used and everything provided for the efficient handling of all the work that offers.

Upholstering and Trimming

Is Buttoned Seat More Lasting?

Chesterfield Growing in Popularity—Design Hard to Improve—Is Buttoned or Loose Seat Better Construction?

The Chesterfield is without doubt one of the most popular pieces of upholstered furniture. Various other styles in many shapes and sizes are put on the market in an endeavour to create an impression among customers that they constitute the very last word in upholstery, but while these designs come and go, the Chesterfield, with its dignity, charm, comfort and saleability, remains, says a writer in "The Cabinet Maker and Complete Home Furnisher." Both the shape and name are familiar to the public, and from the manufacturer's point of view the Chesterfield always constitutes sound selling stock. It may be used in varied surroundings, and in almost any setting or period furnishing, provided it is covered with a material suited to the particular scheme of which it forms a part. Leather-bound in the city man's club, the director's office, or the library, upholstered in silk for the drawing-room, or chintz for the boudoir, it looks well in a variety of positions: rigid against the wall, crosswise for the drawing-room, or made to specification to fit recesses and angles.

The style is always pleasing, and such satisfactory effects are difficult to obtain from any other shapes, but there are Chesterfields and Chesterfields. Many designs evidently intended by the framemaker and upholsterer to represent this style are merely ugly reproductions, not worthy of the name, for a correctly proportioned and well upholstered Chesterfield is very hard to beat from the point of comfort and appearance.

Plain or Buttoned?

It should be mentioned at the outset that a buttoned Chesterfield is far superior in appearance to one which is upholstered plain, as well as being softer. In spite of the greatest care exercised in the selection of springs, the quality of materials, and other details, the resiliency of upholstery is considerably lessened when it is covered plain. The reasons for this are obvious. A certain amount of strain must necessarily be given to the outer fabric to allow for the stretch and give of the material. A plain covering, if not strained quite, may become slack, causing a fulness that gives an inferior appearance to the work.

In buttoned upholstery this danger does not exist. A slackness or fulness is imparted to the material and gathered up into regular pleats by the formation of the buttons, and therefore the full resiliency of the first stuffing stage remains. Another important factor too often sacrificed for the sake of economy in material is seat space. To be really comfortable a seat must admit of free and easy movement of the body. The sitter should be at liberty to lounge or recline instead of being forced into an upright position by a seat that is too narrow or a back that is too full. The height of the seat is also important. If too high much of the resiliency is lost. A low seat that allows the sitter to stretch his legs at full length is much more comfortable than a high one.

The Turks are generally credited with being lazy people. Whether this is true or not, the luxurious comfort of their divans would at least justify the assertion. These are made with seats but a few inches from the floor, and of ample width, sometimes consisting of a series of cushions with a fixed bolster at either end, and without any backs.

Has Changed Slightly

The modern Chesterfield differs slightly both in form and construction from that produced a few years ago. The frames of the older models were heavy, solidly constructed pieces, shaped to conform to the design of the finished article. The modern frame, while amply strong and durable is designed to secure lightness as well as strength so that many of the braces and rails, used in older frames, are omitted.

The general lines and the comfort and luxuriousness of the original piece have been retained but there is this difference; in former years springs were not used to the same extent that they are today so that the earlier settees depended on an abundant use of curled hair for their resiliency. Hair is endowed with lots of life and elasticity but it is doubtful, if used by itself, that it gives a more enduring seat than when springs are employed. Certainly at present prices it would be a much more expensive form of construction.

To-day the Chesterfield is coming into its own as the very acme of good taste and comfort. It is in good demand and in spite of the comparatively high figure at which it is sold, it is finding its way into all classes of homes.

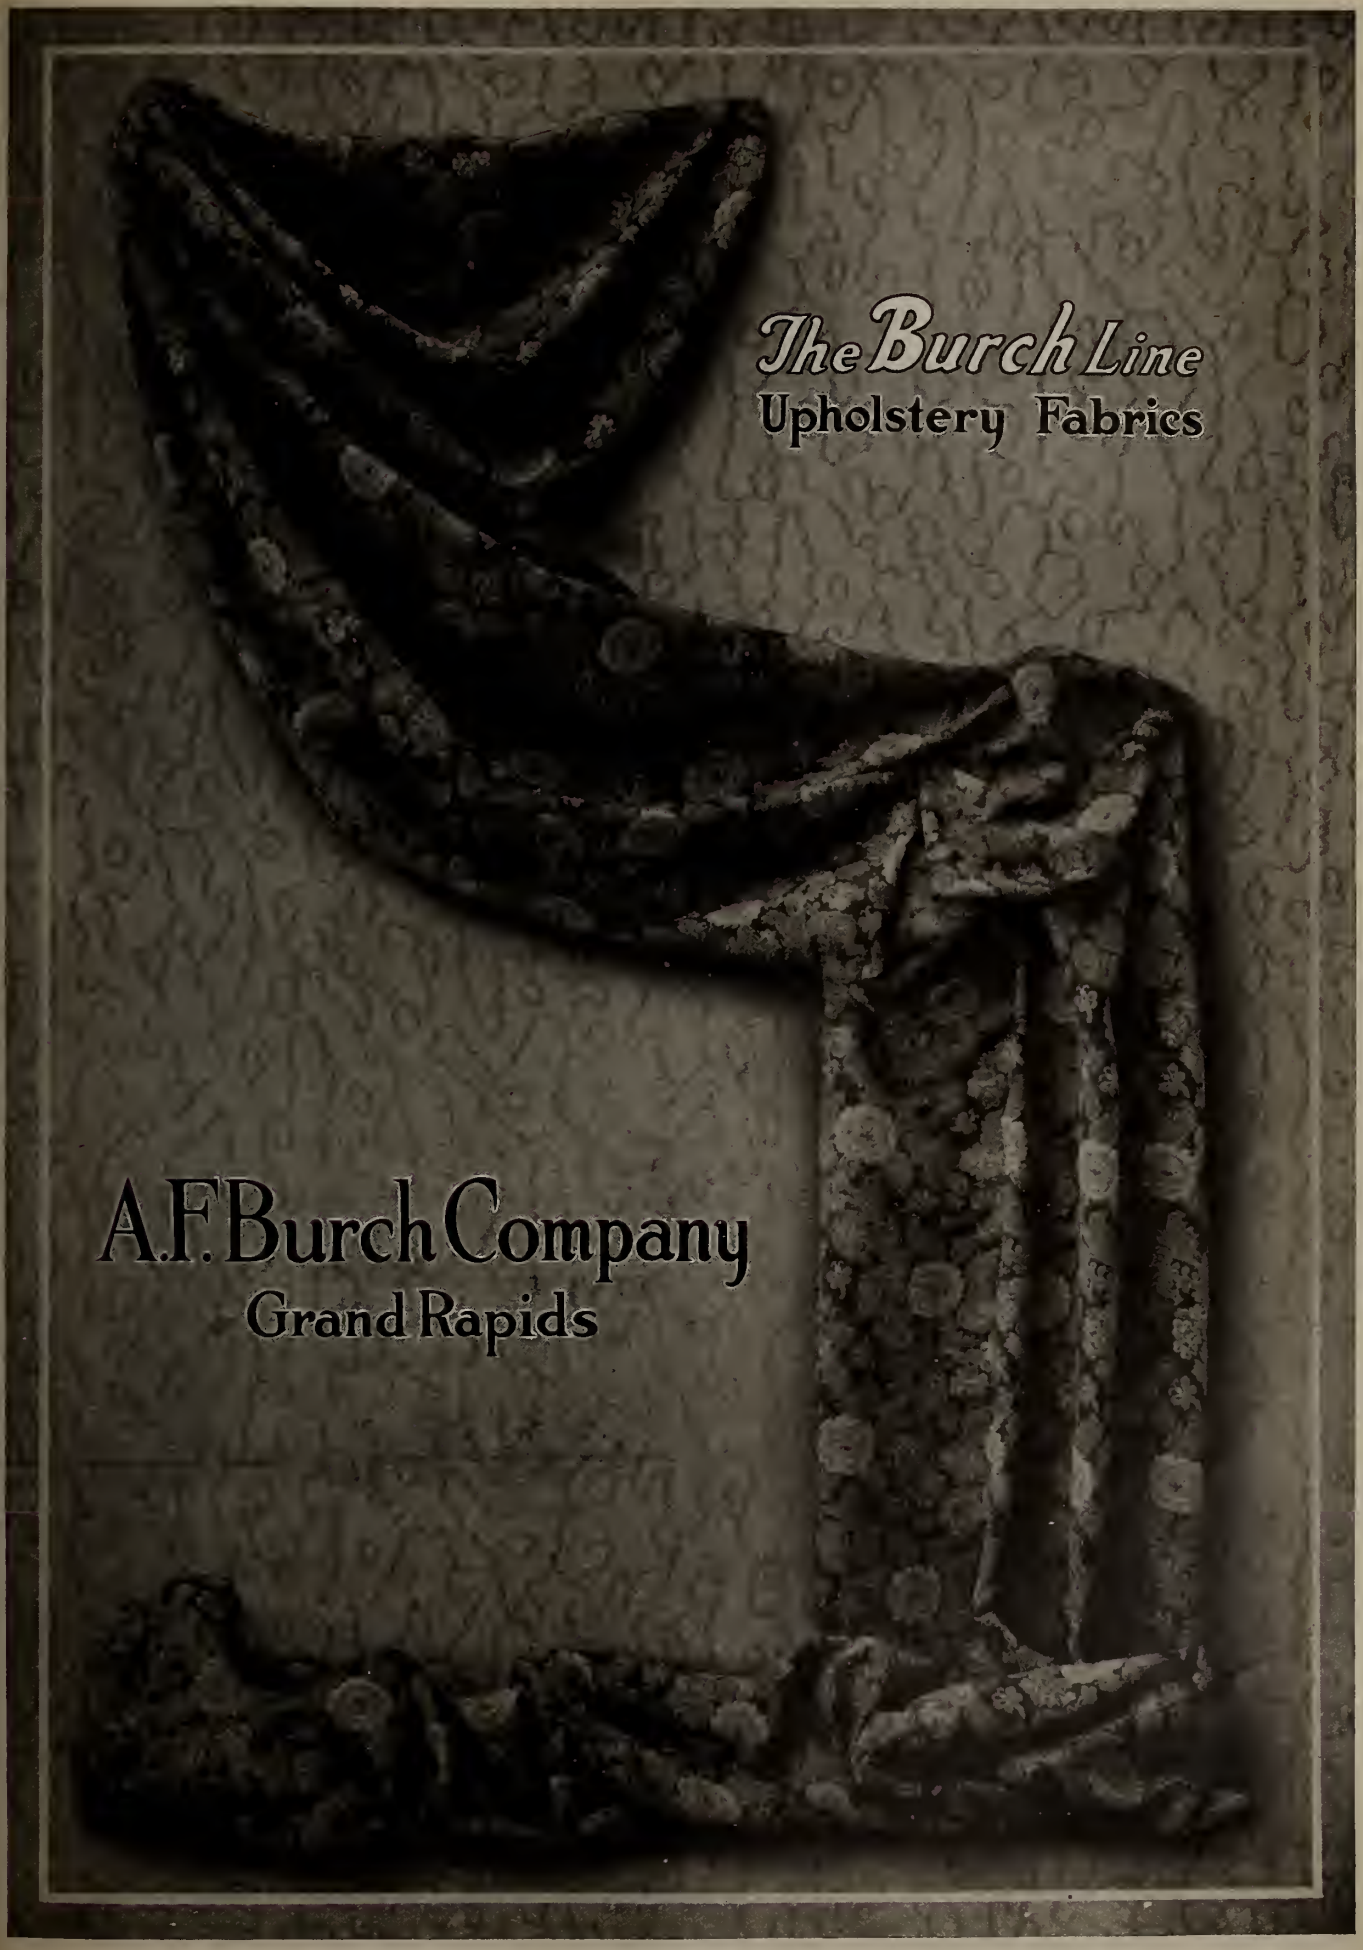
Plan That Doubled Production

Reduced Labor Turnover and Increased Output—Different Forms of Bonus—Shop Committees Adjust Complaints

By dealing intelligently and squarely with labor, Fayette R. Plumb, Inc., Philadelphia tool manufactories, have more than doubled production, reduced working hours and cut down the yearly turnover of the company's workmen 75 per cent. By a system of representative government, combined with a series of welfare features, all unrest and discontent in the working force, two-fifths of which is foreign born, has been eliminated—striking evidence that there is a solution for the labor problem and that, when found, it checks present-day soaring costs.

"Our policy of a square deal to our workmen is the most important single factor in our success," says William D. Plumb, works and employment manager and brother of Fayette R. Plumb, the president of this company, which has factories in Philadelphia and St. Louis.

"There is no getting away from the fact that ap-



The Burch Line
Upholstery Fabrics
A.F. Burch Company
Grand Rapids

plication of the Golden Rule to business is as essential as it is in our private lives.

"In handling labor problems, I endeavor to put myself in the place of the workman and look at things from his viewpoint. I have worked in every department of our factory, and so have my brothers, Fayette R. and Joseph H. Plumb, and we know what the workman is up against. When there is a doubt, the workman is given the benefit of it. Though it costs a little here and there to keep such a policy in effect, we are more than repaid in better work, more faithful employees, and a greater output."

Instruction for Foremen

Instruction of foremen and minor executives in the real principles of the business in which they are engaged, Mr. Plumb considers a vital force in the fight for increased production. When a workman understands that every minute he loafs and every time he spoils a piece of work he is not only cutting into the company's profits but his own prosperity, he begins paying stricter attention to bettering his work.

A large blue-print chart has been posted throughout the factory. It shows, in a way that each workman can understand, how a production of 3,000 tools per day means an income which is insufficient to pay the cost of materials and operaton. It also shows, in contrast, how a production of 12,000 tools per day brings an income which pays all expenses, allows the company a fair profit, and leaves a wide margin for distribution in the form of wages.

Practical demonstrations have been given to show foremen how one lagging department in the factory will cut down the profits of the entire establishment as effectively as though every department were on a par with the lagging one. Workmen are shown why one defective tool sent to a customer places an obstacle not only into the paths of the sales forces, but in the path of the workmen himself when he goes to draw his salary.

Three forms of bonuses have been introduced:

(1) A "perfect work" bonus of 10 per cent on all piece work rates, subject to deduction for careless work.

2. A monthly attendance bonus of 10 per cent, half of which is for not losing time, and the remander for maintaining the standard of a good workman. This bonus has reduced absenteeism from 125 workmen a day to 13 a day.

3. A high cost of living bonus of 30 per cent on the base pay of the worker, payable weekly, with no obligations atached.

A further boost to production has been given by a form of instruction to less experienced workers in the grinding and polishing departments. Seven such workers are placed under the supervsion of a "gang boss" who is experienced and knows the work thoroughly, and by thus splitting up the force in these departments into "gangs," every man has the benefit of direction and consultation with skilled men.

There has been a slight reduction rather than an increase n the working force during the eight months that the production has gone up 100 per cent. Weekly working hours have been cut from 52½ to 47½ hours.

The Employees' Representative Committee has been a potent instrument in driving discontent from the factory. Formed experimentally in October, 1918, its work was so effective that in May, 1919, the committee became a permanent Plumb institution.

It is composed of twelve representatives of the employees (elected by secret ballot semi-annually), and four representatives of the company, appointed by the president with a power of three votes each. Each member of this committee is charged with constant and careful observation of the department in which he works, with the view of making recommendations to the general committee, which meets bi-monthly.

Complaints by workmen are submitted first directly to the foreman or superintendent, and, failing settlement satisfactory to the worker, they are carried to the works manager. Appeal may be taken from his decision, in writing, to the Employees' Representative Committee, where action by a majority vote is final. Should the committee be unable to agree on a majority vote, the complaint is taken before four members which the Representative Committee picks from its number, sitting in conference with the president, secretary, works manager and. comptroller of the company. A majority vote is final in this Committee of Final Adjustment.

No individual complaints have yet been made which have not been settled satisfactorily before reaching the Representative Committee, and at no time has the Representative Committee failed to reach an agreement.

Applicants Personally Interviewed

The system of employment, in effect, has as its main purpose the hiring of men who are suited for the kind of work which the factory has to offer, and the placing of these men in jobs for whch they have some natural adaptability.

Among the purely welfare features of the factory are an athletic association, which divides itself between athletics and entertainments; a form of free sick and death benefits carried by the company, a cafeteria and dining room; club rooms for the evening recreation of employees; a ten-minutes' rest period durng the morning; a school in Americanization for the 200 foreign born workers, and a plant magazine.

The Plumb company was organized in 1856 and is one of the oldest and best known tool manufacturing concerns in the United States.—American Furniture Manufacturer.

"You have been cutting mahogany on this saw bench," said the amateur Sherlock Holmes, as he looked at the red dust.

THE FINISHING ROOM

Fine Finishes for Different Woods

Georgia Pine and Sycamore Best in Natural—Close Grained Woods Require Little Filling—Light Transparent Stain for Delicate Grains

By John N. Moore

Securing good lumber is one problem, making it up into good furniture is another, and finishing it, something altogether different. The last coat is the final touch of perfection which may make or mar a sale. Furniture, nowadays, has to be good all the way through, from cutting the lumber to finishing the ttable, chair or what not. One cannot skimp any point along the line and build a permanent good will. We gain our final knowledge through long experience and through failures corrected. Successes also figure in the practical and final determining of best methods.

The same finishes should not be used over light woods as prove successful on the darker. When you apply oil over Georgia pine, in the bare wood, it darkens it, therefore, it must receive a protecting coat of shellac varnish, the same being true of maple. In the old days we used to finish it up in oil, which was at that time considered the best method, but at best, it was only a cheap, easy job, and time and better understanding has emphasized its disadvantages, for it spoiled both grain and color.

Natural Finish for Yellow Pine

Yellow pine has, of course, a beautiful grain, particularly that, found in the hard growth. In the old days we used to use hard or yellow pine in cheap grades of furniture. It looked very well for a time, but later would turn dark and it became difficult to restore its original beauty of grain and color. Better than oil is a coat of brown japan, which gives a little color and accentuates the beauty of the grain, but the natural wood preserved by shellac and given a coat of finishing varnish gives the best job. Japan, however, should be thinned down with benzine and rubbed well into the wood. The first coat wiped off but the succeeding coat should be left to stand. Orange shellac gives some color to the wood, but when you want to keep the color and grain exactly as it comes, white shellac brings best results. The former may have better body, which accounts for its presence on hard pine and on all cheap work.

The first thing required of any finish is a smooth surface, free from dust and markings, even from pencil or finger marks. Unless the varnish is more or less colored the slightest mark will show up in the finish, therefore, you are assured much better results by taking pains to see that the surface is clean and bright.

Securing a Colorless Finish

If you want a colorless finish, apply a first coater of white or bleached shellac, using denatured alcohol to make it pretty thin. If nails are used see that the holes are puttied up with a good filler or wood lead thinned with yellow ochre or chrome yellow. Be sure that your filler matches the wood. It can even be a little darker, as for the passing of time the wood slightly darkens while the filler or putty holds its original color. Where shellac is used you sandpaper the first coat with No. 0 paper. Remove all dust and then apply a good grade of pale interior finishing varnish, slightly thinned with turpentine. After this has become absolutely bone dry, say after two days has elapsed, sandpaper with No. 0 paper again and dust off. The intention in this case being merely to remove the gloss. Fine curled hair or steel wool will do even better than sandpaper.

After this preliminary work give the surface another coat of varnish just as it comes from the can, not diluted in any way, and this coat may be rubbed or more coats applied if desired, the number of coats being determined by the use of the work you wish to turn out. A rubbed finish usually requires three coats of varnish, the last coat being required to rub with pumice stone and water, or oil. After this polish up in the usual manner. The above can be followed or the last coat may be flowed and left, providing the varnish is A-1 a fine lustre will result.

Natural Most Suitable for Cherry

A finish process of this kind reveals the pine in its most attractive form, yet there are many finishers who think that a dull or rubbed finish looks as well or better. Hard Georgia pine seldom needs any filling, the liquids used being surfacers rather than fillers. The above are light colored woods and there are others which come between the very light and the very dark woods. Cherry, for instance, is one of these, and is very attractive, we might say, the most beautiful when finished in the natural, but, as a rule, is stained to match other woods, mahogany being, probably, the best "camouflage." A burnt sienna stain is generally employed for this process, but there are aniline stains of rich mahogany color to be employed where a deeper and richer tone is desired.

Cherry is also one of the woods which must be made smooth and perfectly even. It, too, must be free from marks as must all surfaces upon which you desire a perfect finish. Cherry is a close-grained wood and requires only a surface filling. The same process can be followed as detailed for hard pine and maple.

We believe shellac to be the first so called surfacer and filler. First shellac and then a varnish finish is the usual process for cherry, the same as maple. Some prefer an oil stain, some water, some say that the latter is apt to leave a lap, which, of course, mars the finish, but care in application will remove this feature. If a lap should occur you can wet the edge of the lap and also that of the adjoining or unstained part.

Sycamore Takes Fine Finish

Another very beautiful wood is sycamore in the quarter sawed. It should be left in the natural. It has a very beautiful grain, wonderful markings, a very individual color and, when properly finished,

surpasses most other hard woods in its beauty, which is of a very quiet nature and quite unlike the strong contrast in features of oak, chestnut, ash, etc. Quarter sawed woods always give better effect than those which are plain sawed; they both, however, have the same color.

It is a good rule to follow never to stain sycamore, but finish it up in the natural the same as you would maple with a thin white shellac, then a varnish. We believe that on maple and birch that a water stain should be used, especially where the natural finish is desired, although some finishers show a preference for a spirit or chemical oil stain. All of these woods have very delicate markings, and do not take stains very readily unless it is a transparent one, otherwise, if a heavier stain were used the grain would be more or less obscured.

If you should use a pigment stain wipe it off well in order not to hide the natural beauty of the grain. In speaking of birch there are of course the white and red, the latter having a sort of curly growth and is very fine. Birch is often used to imitate several other woods, but, when finished in the natural, it is very beautiful and entirely satisfactory. There are some finishers who will tell you that birch is ruined by staining, but a great deal depends upon the finisher and his skill in his work.

No filling is really required on close grained woods. If, in order to counteract the action of water and the grain upon the stain, it is deemed best to use a paste filler which can be tinted to soothe the color that you want in the finish. Two and one-half pounds of paste-filler may be put in good condition for use with the addition of one-half gallon of liquid. The batch is to stand about 24 hours after application for the filler to set. Sandpaper well and then apply your priming coat which should be thinned to match the ultimate finish color. Use a like pigment for this purpose. After 24 hours sandpaper well and flow on a full coat of a good, high-grade polishing varnish, after this polish and finish in the usual manner.

Suggestions for French Polishing

Have Pores Thoroughly Filled—Knack in Forming Pad or Rubber—Dipping-up or Refilling of Pad—Consistency of Polish.

After carefully cleaning the wood of all superfluous filler, which is best done by means of odd pieces of canvas, hessian, or any coarse material, the corners and quirks of mouldings may be cleared of any remaining filler by the aid of a pointed hardwood stick. The filler in the pores must be allowed to dry, and if possible, 24 hours should elapse before polishing is commenced, says a writer in an English publication. Should it be inconvenient to allow the full 24 hours, it is a good plan to arrange that the filling of the pores shall be the last job before closing down in the evening; this will give at least 12 hours for the drying process.

On the thoroughness with which the preliminary processes are carried out depends the ultimate result, for, if the pores are not thoroughly filled and allowed full time to dry, loss of "body" or thin appearance, due to the sinking in of the pores, is bound to ensue. There is nothing mysterious about the matter; it is obvious that with any substance conveyed by means of a liquid that liquid must eventually evaporate, and that, after the evaporation and consequent drying of the solids, contraction or shrinkage must take place It stands to reason that if this shrinkage does not take place before a coating of polish is applied it will afterwards, with dire results to the polished surface.

Standard Wood Fillers Being Used

The pore-filling medium generally employed by English polishers is plaster of Paris moistened with water and rubbed into the pores by means of a piece of rag. Any surplus plaster after the drying is completed is removed by glasspapering with fine glasspaper, the cutting surface of which is toucehd with a little oil. As plaster is white, and likely to show white in the pores, a good plan is to color it with rose-pink when it is to be used for mahogany, or Vandyke brown should the wood be walnut. This plaster of Paris filling is gradually giving place to the proprietory brands of woodfillers as sold by the leading polish supply houses..

The polishing process proper may now begin. This, as generally understood in Europe, is the application of a solution of lac or shel-lac—the solvent being methylated spirit—by means of a pad or rubber, as it is technically called, and which is covered by a piece of linen rag. There are two methods in actual practice and one or other of these is employed, according to the nature of the work, class of trade or particular market for which the goods are destined.

Forming Pad or Rubber.

In the case of work of the cheaper class the pad or rubber will be made of cotton wool or wadding covered with a piece of linen rag of fine texture, such as a piece of white linen shirting. The rubber is made by selecting a piece of wadding that will fold into the size suitable for the job and drawing the edges towards the centre, being careful to keep the front portion or toe pointed, whilst the bulk of the cotton wool is drawn to the hinder portion or heel. The face of the rubber must be perfectly level; if it is not it will be found impossible to polish a flat surface with it. The pointed formation of the toe and the flatness of the surface are the two things to watch in the making up and subsequent use of the rubber, for, no matter how shapely a rubber may be when starting work, after a little use it will be found that it conforms to the shape of the hand. After shaping the wadding into a rubber, a piece of fine linen is stretched across the surface, the surplus rag being twisted round the top of the heel of the rubber and thus forming a grip for the hand when working. As the face of the rubber must be kept flat, it naturally follows that the rag covering must be without creases.

Filling or Dipping-up.

To fill the rubber with polish, hold it face upwards in the left hand and with the right hand turn back the covering rag, pour an even amount of polish over the whole surface from a bottle that has a cork with a groove cut down the side to form a sprinkler. This will prevent waste and save uncorking the bottle every time a fresh supply of polish is required. After replenishing, or "dipping-up," as it is technically called, the rag is restretched across the rubber with

the right hand, the surplus rag once again twisted round the heel and the rubber is ready for use.

A word of warning to the novice will be helpful: whilst it is necessary to remove the covering rag, the surface of the rubber itself should not be interfered with. After it is once made, a rubber should be kept in shape as long as possible. All that should be necessary for quite a long time will be to press the face of the rubber flat on the back of a piece of used glasspaper for the purpose of spreading the polish contents of the rubber evenly and at the same time keeping the face flat. So jealous are professional polishers of the shape of their rubbers (which, as we said before, gradually assume the shape of the hand) that it is the hardest thing in the world to get them to loan a polishing rubber, as they fear that in other hands the original shape may be spoiled.

On commencing the polishing proper it will be found that the pores that were apparently filled have in the drying opened somewhat. This can be remedied by "dipping-up" with a very thin shellac solution, a thin polish consisting of one part polish to, say, ten or twelve of methylated spirits; this will reduce the color to about that of brandy. With this thin polish a small quantity of flour pumice powder can be ground into the pores, which will quickly be filled again by this process.

Considerable Skill Required.

To the novice the handling of the rubber will be a matter of some difficulty at first, and before trying his 'prentice hand on a serious piece of polishing it is recommended that he first break his hand in on a piece of worthless wood; if this is done a great deal of disappointment and a considerable amount of washing off will be saved; for polishing, and we mean polishing and not the wood-spoiling that sometimes passes for polishing, is a highly skilled trade and by no means the easy process that it appears to the layman. This is not written to deter the novice, but rather that he should appreciate the difficulties he is bound to meet and encourage him to overcome them.

The first thing to remember is that a good grip of the rubber is essential. Let the whole of the rubber sink into the palm of the hand and the three centre fingers of the hand extend to the point of the rubber, whilst the thumb and little finger grip the sides; all the fingers and thumb should be as near the face of the rubber as possible without quite catching the surface of the wood in the course of polishing. If the rubber is held in this way a good grip can be obtained. Whilst holding the rubber press the face firmly on a disused flat piece of glasspaper, and, when quite flat, transfer the rubber to the work in hand with a gliding motion; do not dab it flat down, and should it be necessary to take the rubber off again, say, for refilling or "dipping-up," it must not be lifted direct off the work but removed with a gliding motion. A little practice as suggested on a useless piece of wood will soon acquaint the novice of the necessity for this. It is not an unusual thing to see a novice talking to a companion with the rubber resting on and almost stuck to the work.

Thin to Suit Wood and Work.

As soon as the rubber is in contact with the wood it must be kept in motion, partly to prevent it sticking to the work, but mainly to carry out its purpose—that is, to spread a thin film of shellac or polish over the whole surface of the wood.

How thick or how thin this coating of polish is will depend on the class of work and the varying porosity of the wood. We are often asked how much polish will be used in polishing a certain article of furniture? It is impossible to make a general assertion on this matter that will apply to the methods and conditions of each different workshop; therefore the costs of materials required for polishing can only be obtained by careful supervision and issue of polish stores.

There is plenty of scope for this, for with polish at its present price it is foolish to leave jars and drums unstoppered day after day, bottles uncorked and unused, glasspaper lying on the floor to be trodden on. A little attention in this direction will soon pull down the polishing costs. It may be interesting to some of our readers to note the covering capacity or shellac varnish applied, of course, by brush. One gallon shellac varnish covers 400 sq. ft. first coat applied to smooth pine; second and subsequent coats, 500 sq. ft.

Value of Co-operative Advertising

Co-operative advertising can accomplish for an industry, or a group of industries, all that advertising can accomplish for the individual producer. It can enlarge and stimulate the basic market by creating new users. It can spread a seasonal demand into a longer and more uniform demand. If the commodity to be sold has any points of superiority it can, by communicating these features to the public, win a larger share of the total business. It can reduce the cost of selling by supplementing personal salesmanship and making it more effective. It can reduce the unit cost of production by causing a larger volume of goods to be produced. It can improve the esprit de corps of merchants, salesmen, clerks and workmen by awakening an increased consciousness of the importance of their industry, and by bestowing upon them a better prosperity. It can correct misunderstanding by telling the truth. It can foster good will by pointing out services and policies of mutual benefit. It can educate the consumer to be a more discriminating buyer and set up trade-marks for the buyer's protection. It can promote standardization and dependability by developing new incentives for uniformity in quality.

When we know that co-operative advertising has widened markets, stimulated industry, stabilized selling, improved merchandise and lowered costs; when we know that it has been used to make us take better care of our eyes, live better, read more good books, put more money in the bank, and give more to the church; when we know that it has brought businesses and business men closer together in a spirit of comradeship and mutual service, I do not think that we can then doubt that co-operative advertising is not only a powerful sales force but a social service as well.—Printers' Ink.

Unique Use for Knot Hole

That a use has been found for the knot hole, which is regarded generally by lumbermen as about as much value as the squeal of the hog, is vouched for. Chicago packing houses are said to use all of the hog but the squeal but a Yankee going this one better, is said to have found a use for the knot hole. Taking a piece of board one inch thick which has been cut off in some factory because of the knot hole which the piece contains, the Yankee squares the pieces with the knot hole centered, sets it upon a ½-inch wooden base, glues the two together, smooths the surface of the piece and gives it a bath of varnish. Behold, the piece is a wooden novelty suitable for the desk as a receptacle for paper clips, fasteners, pins, or the like!

How Moisture Aids in Varnish Drying Kiln

Eliminaton of Thinner Does not Harden Varnish—Conditions Necessary for Successful Drying—Development of Varnish Drying Kiln.

——By Harold Sutton———

Varnish is used so much for so many purposes that every finisher should have a practical acquaintance with this material. How many finishers can tell, offhand, how varnish dries? How humidity aids in quick drying, when a kiln is employed, and what troubles occur when a second coat is applied before the first is dry?

To understand how varnish dries it is first necessary to know the ingredients of which it is composed. The three main ingredients in any good varnish are; gum, oil and some form of thinner. usually turpentine or some light petroleum product. The thinner is used merely to render the gum and oil liquid so that it may be applied quickly and easily. It does not serve any other purpose. The varnish dries by the elimination of the thinner and by a chemical change, brough about by the oxygen in the air, which hardens the gum and oil.

Necessary Drying Factors

Thus it is obvious that to dry varnish quickly and efficiently requires warmth to eliminate the thinner and fresh air (oxygen) to cause the hardening of the gum and oil. That being the case the finishing room must be warm and must have a good circulation to carry off the fumes thrown off in evaporating and also to provide a steady supply of oxygen. Warm fresh air is, then, required to dry varnish under ordinary conditions.

The term "ordinary conditions" is used advisedly in the above paragraph, for it is meant to apply to air drying under natural conditions, which requires twenty-four, forty-eight, seventy-two hours or even longer to secure a thoroughly hardened surface. Modern production methods have found that the slow air drying of finished goods, retarded the even, steady flow of work through the plant, so desirable where high production is aimed at, no resort was made to artificial means for hurrying the drying of the varnish and other finishes.

Development of Varnish Kiln

Naturally the first recourse was made to a heated room. It was figured that raising the temperature would hasten the evaporation of the thinner thus cause quicker drying. What was the result? After twenty-four hours of heat the varnish seemd to be stickier and tackier than when it went in. It may have had a slight skin on the surface but was far from dry. No doubt it was thought that this poor drying was due to the fact that the air became saturated with the fumes from the thinner and was unable to carry off any more thinner. Perhaps a little investigating and experimenting was done and it was discovered that oxygen was needed to effect the chemical change which causes the gum and oil to harden. At any rate ventilating was resorted to.

Did they fare any better when they ventilated the drying kiln? Yes they did. They found a lovely hard surface next time they opened the kiln but the trouble was that it was only the surface. The current of warm air hardened and sealed the surface before sufficient oxygen had reached the bottom of the coat. This meant that the surface drying must be retarded sufficiently to allow the oxygen in the air to reach and harden the under part of the coat first thus drying it from the bottom out, giving a hard well-dried surface. It was found that the introduction of moisture gave the desired result.

Automatic Controlling Instruments

The next step was to provide automatic humidity and temperature controlling instruments so that today we have the modern varnish drying kiln, with its forced circulation of warm, moist air. The drying conditions in this kiln are automatically controlled as to humidity and temperature. As these controlling instruments are subject to adjustment, practically ideal drying conditions may be secured and maintained.

The makers of the best types of varnish drying kilns have gone a step further and have included an air washing system that thoroughly cleans the air, before it goes into the kiln, removing all dust and other impurities. When this is employed the dried varnish surface is free from dust and specks.

A hygrometer or wet and dry bulb thermometer may be used to determine the relative moisture content of the air. A plant recently visited was carrying a temperature of 110° on the dry bulb and 100° on the wet bulb and were getting good results. It was found that the varnish was dried thoroughly in an eight or ten hour period. The adoption of the humidity controlled kilns to the drying of varnishes and finishes has been one of the big factors in increasing the production of the modern finishing room.

Finishing Tenessee Red Cedar

Tennessee red cedar is used largely for cedar chests and other similar articles. The grain is a beautiful shade of red, the sapwood white and the knots a very deep red. In order to bring out the beauty of this color combination a natural finish is usually given. The usual method is to give a coat of white shellac, sand, two or three coats of varnish and rub to an egg-shell gloss. If a deeper shade is desired the wood may be oiled before shellacing.

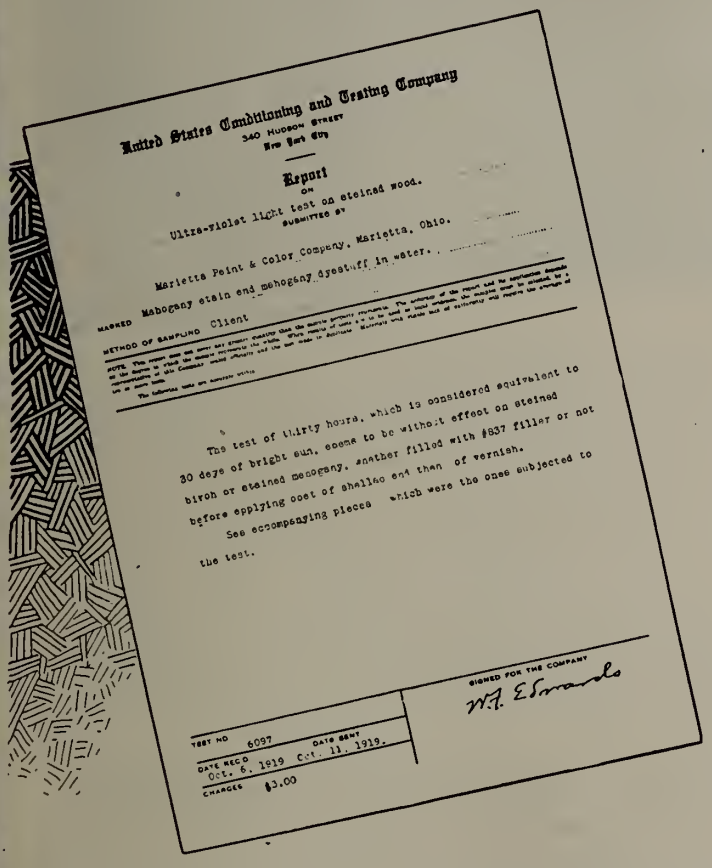
Shortage of Piano Actions in England

At the present time there is a very active demand for all that is produced (in the piano trade), but it must be remembered that there is what may be termed an artificial shortage of actions. At any rate, their scarcity is more marked than is that of any other article used in pianoforte manufacture. When actions can be bought freely on the market, as desired. we shall look for some distinct changes in piano prices. There will be more competition among the makers themselves, and their numbers will increase, for we are constantly aware that men—some dealers, and others ex-contractors—are only held back from commencing manufacture by the practical impossibility of securing actions and factory accommodation. Foreign actions may be imported; but this would not reduce prices directly, for on information given to us, they, at the present time, cost more than English actions.

MACO

MARIETTA WOOD FINISH SPECIALISTS

The New Principle Non-Fading Stain



United States Conditioning and Testing Company
340 Hudson Street
New York City

Report
On
Ultra-violet light test on stained wood.
Submitted by
Marietta Paint & Color Company, Marietta, Ohio.
Marked Mahogany stain and mahogany dyestuff in water.
Method of Sampling Client

The test of thirty hours, which is considered equivalent to 30 days of bright sun, seems to be without effect on stained birch or stained mahogany, another filled with #837 filler or not before applying coat of shellac and then of varnish.
See accompanying pieces which were the ones subjected to the test.

Signed for the Company
W. T. Edwards

Test No 6097
Date Recd Oct. 6, 1919
Date Sent Oct. 11, 1919.
Charges $3.00

Thirty days of bright sun fails to change this non-grain-raising stain. See facsimile of report on test made by the United States Conditioning and Testing Co. herewith.

Maco is neither a water nor an oil stain, but has the virtues of both without their faults.

It has the non-fading quality of a water stain, the non-grain-raising quality of an oil stain, and can be filled directly over like a spirit stain.

A tremendous saver of toil and trouble, to say nothing of money.

The "Corsair," owned by Mr. J. Pierpont Morgan.

Why the "Corsair" sailed on time—

IN JUNE, 1919, Jim Fraser, just back from France, took off his uniform and went to work for the Electric Floor Surfacer Company, 149 West 36th St., New York City.

Three weeks later he was made foreman. "Because," as Mr. Campbell, the manager, said, "when you give Fraser a job it's done on time."

When J. Pierpont Morgan's big steam yacht "Corsair" was mustered out of the Navy her decks were badly scarred from hard service in foreign waters. Mr. Campbell contracted to re-finish the "Corsair's" decks and turned the job over to Fraser. "The 'Corsair' sails Friday? Three full working days. That's easy," said Fraser. But—

Those three days it rained. Not until Thursday afternoon did it start to clear. And the "Corsair" was to sail next morning.

That hot July night the deck-watch on the "Corsair" saw a stubborn fight against Time.

Under the white glare of the deck lights Fraser and his little crew worked feverishly—all night long their sanding rolls, covered with fast-cutting "Speed-grits," whirred at 1750 R. P. M., grinding down the scarred deck surface.

At 7:10 Friday morning, the job was finished and Fraser, with his weary crew, left the yacht.

At eight o'clock the "Corsair" sailed—on time!

"A tough job," said Fraser. "That deck was scarred from loading shells, splotched with oil and grease and water-soaked from the rain. Some job—but 'Speed-grits' Garnet Paper is *some* job-speeder."

'And I've got *some* workmen," added Mr. Campbell with a smile. *Good workmen know the difference.*

Look for this trade-mark on the back of every belt, sheet or disc.

The above photograph shows the Nichols Equipment installed in the works of the Votey Organ Company, Garwood, N.J. These dryers may be used to turn out automobile bodies, furniture, pianos, talking machines, etc., in as many days as it formerly took weeks, and the finish is better, for it is dried scientifically, from the inside out.

If not already Nichols equipped, you owe it to yourself at least to investigate, because:—.

1—It will easily triple the output of your finishing rooms.

2—It will decrease congestion in your factory.

3—It will decrease the investment in goods necessarily in process.

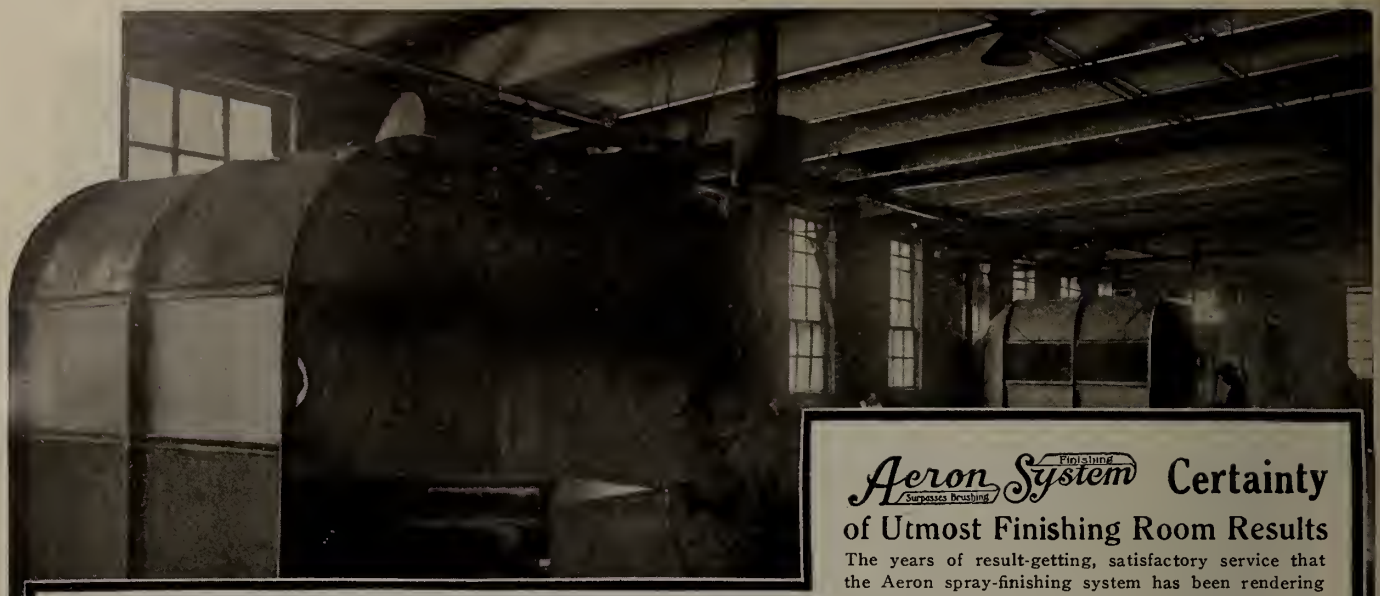
4—It will enable you to make more prompt deliveries.

We will analyze your particular conditions and then make you a proposition on an equipment that we know, from our extended experience, will save you time and money, as well as improve your product.

We guarantee fully the efficiency of the equipment as well as its mechanical construction. Every installation has been successful. There are hundreds of concerns to whom we can refer you.

A. S. NICHOLS COMPANY, 33 W. 42nd St. NEW YORK CITY

Manufacturers of Dryers for Lumber, Veneers, Glued Stock, Varnish, Paint and Enamels, for both high and low temperature work. Also sole agents for "Zenitherm" insulating material for the making of rooms for both high and low temperature drying.



Aeron Finishing System — Surpasses Brushing

Certainty of Utmost Finishing Room Results

The years of result-getting, satisfactory service that the Aeron spray-finishing system has been rendering the wood and metal-working industries, gives to each new installation of this equipment an assurance of the utmost in quality, speed and economy.

No matter what type, size or grade of product you manufacture, nor with what kind of finishing material you coat it—the Aeron System undoubtedly is now being used on work of the same or a similar character, and will be most certain to make it possible for you to do the highest grade of work at a big reduction in costs.

Operation Facts One Aeron operator easily does the work of 2 to 5 or more hand brushers--this is governed by nature of work.

A cleaner and more uniform coating of every material is applied—there are no brush marks, thin spots or fatty edges.

Work is made absolutely healthful and safe—all fumes are completely removed.

Equipment is kept in the best working condition at practically no cost.

The Aeron System is sold on a strictly guaranteed basis, and every installation followed up by a competent service organization.

Write and let us send on more definite particulars.

The DeVilbiss Mfg Co. 3718 Detroit Ave. *Toledo, Ohio, U. S. A.*

Painting your buildings with Aeron System PORTABLE PAINTING EQUIPMENT means a big saving in time, labor and confusion.

High Grade Stains and Fillers

In our Stains you will find the highest possible color values—they are positive—they are permanent. Manufactured in quantities from the best quality raw materials.

Wood Fillers also that have been tested under the most difficult of varying circumstances and found satisfactory.

Eliminate trouble in your finishing department by using these tested materials.

Veneers and Panels

Making the Veneer Room Efficient

Layout of Equipment Effects Production—Heat, Light and Location Important Factors

By R. N. Y.

When fitting up a veneer room or installing new equipment in this department, it is advisable to give a considerable amount of thought to the lay-out of the machines and the manner in which the work will proceed, while being veneered. The production of many veneer rooms is low simply through the poor lay-out of equipment. This is not always due to neglect but is sometimes due to the inability of the men responsible for the installation to visualize the work of this department and thus see the stock going through with a minimum of confusion and handling and the elimination of all unnecessary or unproductive work.

The ideal glue room is what every factory owner should aim at having. It might be well to consider what constitutes the ideal veneer department, taking it both from the standpoint of production and also of labor requirements. These items are the lay-outs of equipment, an adequate supply of natural light, preferably from a northern exposure, plenty of heat, more particularly if animal glues are used, proper ventilation of both glue room and drying room so that all moisture is carried off, and modern labor-saving veneering appliances.

Causes for Defective Work.

Most of the trouble encountered when making veneer products either in the glue room or from defective work can be traced to either one or more of the factors of light, heat, ventilation or not making the best use of the equipment on hand. It often seems to be taken for granted that any empty nook or corner of the factory is good enough for the veneer department in choosing this location few, if any, of the above factors are considered.

Many manufacturers make the mistake, for it is a mistake, to attempt to do veneered work in the basement of the plant. The chief objection to a location of this kind is that moisture or dampness is usually present to a greater extent in the basement than in any other part of the building. This moisture results in more or less trouble all through the veneering process. It has been proved in actual practice that the work done on the lower floor is more inclined to warp and twist than where the product is veneered on one of the other floors. This is due entirely to the dampness which is encountered in a basement. The logical place for this department is on the second or third floor. Other advantages of the upper location is that it is easier to secure plenty of light, is usually easier to heat and can be ventilated much more readily.

Type of Floor Effects Product.

The floor of this room should come in for a little attention. It is advisable wherever possible to have a wood floor, such as maple or birch, in the veneer room. One often finds that a cement floor has been laid for this work. A floor of this kind is usually more moist than a wooden one. A piece of veneered work stacked as high as from 4" to 6" from a cement floor, will often absorb enough moisture in twenty-four hours to cause it to warp and twist to such a degree that it is rendered practically useless.

We now come to the heating of this department. The writer has visited many glue rooms and found heating arrangements of all kinds both good and bad. Probably the worst of these is the overhead system, that is, where the coils are arranged on the ceiling above. This method not only gives a very unequal distribution of heat, especially where needed most, that is, near the floor where the forms of veneered stock are built up, but also makes it a most unpleasant department in which to work. A forced hot draught or blast system is often encountered. The success of this arrangement depends largely upon the method of installation. If the outlets are such that the warm air is forced directly upon the surface of the veneers that are being glued, trouble is sure to arise. This warm air, will, upon striking the freshly-glued surface, cause a skin like coating to form over the layer of glue. Should this skin form, it will interfere with the adhesiveness of the glue and will likely cause blisters or loose veneers. If this type of heating is used, it should be so arranged that the warm air will circulate evenly around the room and at the same time not blow directly on the stock in process of manufacturing.

Most Suitable Heating Arrangement.

The most suitable arrangement is the ordinary form of steam pipe placed around the walls at the bottom near the floor, thus resulting in an equalized temperature in the lower part of the room where the heat is needed. With an even temperature in the glue room, the glue does not set so rapidly, thus giving more time to build up the stock before rushing it into the press.

In a suitable temperature and under ordinary conditions a skin will not form or the glue should not set under fifteen minutes. When animal glue is used the temperature should be maintained at about 85 degrees. Should it fall below this point, there is a tendency for a skin to form quickly due solely to the lower temperature.

A reliable thermometer should be provided and hung about 3' or 4' from the floor. There is often a variation in the temperature of from 5 to 10 degrees between the air at a 3' level and at a 7' level. Thus if the thermometer is placed high up on the wall the true working temperature of the room is not ascertained. The difference in temperature between the two levels is more marked in winter than during the summer.

Eliminating Lost Motion.

When arranging the equipment, it should be placed in such a manner that the stock will proceed directly through from one operation to another with a minimum of confusion and handling. Thus it would go through the spreader to the press and from there into the piling and drying rooms. If the press and glue

spreader are separated or on different parts of the floor or if the press and drying room are on different sides of the building, it can readily be seen that it will require a lot of additional handling in moving the work to and fro. The same applies to the glue mixer or cooker. It should be as near the spreader as possible. The ideal installation is probably where the mixer or cooker is placed on a platform above the spreader and the liquid adhesive fed to the rolls by gravity.

It is the attention to these. what may seem to be, small details, that often makes the difference between the veneer department which turns out a fair quantity of quality stock and the same department in another plant, which produces a smaller quantity of poorly veneered work. Not only that but it is much easier to secure and retain good workmen when you provide a convenient well-equipped place for them. This latter item often has much to do with high production.

Is the Plywood Auto a Probability?

New Fields Opening Up for this Valuable Commodity—Automobile and Railway Car Manufacturers Possible Users—Development of Waterproof Glue Gives Impetus to Industry

By Lawrence Ottinger*

I have been travelling around the country quite extensively since the war ended and I am reminded of school days when I read that 'All Gaul is divided into three parts.

Our population seems to be dvided into three parts, viz., men who are going to build panel plants, those who are building panel plants, and those who have built panel plants. I am probably not giving you any news when I tell you that the number of new plants is simply enormous, to say nothing of the plants heretofore devoted to other lines of manufacture who have turned their production into panels. I refer to such enormous concerns as The American Car & Foundry Co., Pullman Palace Car Co. and any number of furniture concerns. This undoubtedly means that within a certain period of time, and from present indications, not so very far distant, there is going to be a large over production of panels if they are to be consumed exclusively in channels of previous consumption. In other words, if the consumpton of panels is to be restricted entirely to furniture manufacture, wagon building, store fixtures and phonograph cabinets, the productive capacity will soon be very much greater than normal consumption. One may thus reach the conclusion that panels must find additional fields, or our happy days will soon be ended.

Of the new fields opened by the waterproof proposition perhaps the automibile field has developed more rapidly than any other. There are now two panels plants whose entire autput is devoted to the manufacture of plywood wheels and those wheels are now going into automobiles and are apparently very satisfactory. For tops there is already a tremendous demand. One concern, as you all doubtless know, is making a very large production of waterproof plywood tops. Half a dozen large automobile body builders are using plywood in the manufacture of ribs, roof beams, and other curved braces formerly made of lumber, and find the plywood construction much stronger, light and cheaper. The process is, of course, to make panels in the curvature required, in good widths, cutting these out to the sizes desired.

Three-Ply Automobile Bodies

Probably the most interesting development in connection with automobiles is the use of plywood for the building of the whole body to replace the metal. Some very large concerns have built experimental bodies with a fair measure of success. There is one concern that has built a five passenger Sedan body weighing 120 lbs. which is just about one third of the weight of an aluminum body of the same cubic capacity. One concern in Buffalo is said to be in active production of a body made completely of plywood, although I have not personally seen it. I have seen a bus body, with a double deck, built of plywood practically throughout and weighing about twenty per cent. less than a single bus body of the same size under the old form of constructon.

We have had many requests from engineers connected with large automobile concerns for information concerning bodies made of plywood compared with bodies made of metal, and there have been a good many questions asked such as the ability to stamp out sizes and shapes, but I shall not go into further detail on this subject. However, I can not see any reason why the automobile industry should not take a tremendous quantity of waterproof plywood in the future for the same reason that plywood was adopted for aircraft construction, because it is the material which has the greatest strength per unit of weight. In this connection the gasoline situation is important, with 50 cents a gallon confidently expected. It takes more gas to pull a 5000 lb. car than it does to a 3000 lb. car.

Panels for Steamship Construction

The next important probable source of consumption is in the trans-Atlantic steamer, and in this connection the European seems to be far ahead of the American. We have received from abroad inquiries for hundreds of thousand of feet of plywood to form the partitions between the cabins of passenger steamers. These panels are usually wanted in from 5/8 in. to 1 in. in thickness and average about 5 ft. wide and 6½ to 8 ft. in length. The English want gum, the French birch and the American shipbuilders are not particular as to the kind of wood, it being remembered that all of these panels are heavily painted. When the Leviathan was converted to transport service, it was found that the partitions were made of waterproof plywood three ply with a 7/8 in. pine core and ¼ in. mahogany faces. The latter seemed to be either Cuban or Phillipine mahogany.

The next important demand for waterproof plywood is refrigerator industry, and a number of these plants are either buying waterproof panels or buying waterproof glue and laying up their own panels. They

Panels and Rotary Cut Veneers

Considering the present large demand for high-grade cabinets and the extreme scarcity of good panels, it may interest you to know, Mr. Manufacturer, that we now have in stock, and can make immediate shipment of, a very large quantity of both three and five-ply panels for talking machines in either

Mahogany, American Walnut, Quarter Sawed Oak

We also have for immediate disposal a large supply of birch and gum panels adaptable for shelving.
We are in position to take orders for future delivery. Order now for holiday trade.

We have just received a big shipment of single ply spruce for horn stock. Write us for prices on cross banding and core stock.

"The Kiln Drying of Lumber"

A Practical and Theoretical Treatise

By HARRY DONALD TIEMANN, M.E., M.F.

In charge, Section of Timber Physics and Kiln Drying Experiments of the U. S. Forest Service. Special Lecturer in Wood Technology and Forestry, University of Wisconsin. Forest Products Laboratory, Madison, Wisconsin.

Second Edition 318 pages.

The value of a technical knowledge of *kiln drying* is self evident. This book, as does no other upon the market, gives the reader the most recent and most clearly expressed information. The text and illustrations guide the way to the most efficient methods of work.

Price $5.00

CONTINUOUS SERVICE FOR TWO GENERATIONS

One of our principal competitors recently paid us the compliment of the voluntary statement that our position in the hardwood and veneer trade was the result of never varying from the traditions on which our organization was founded.

Northern Grown Oak

Fifty-two years of making and finishing the right kind of product has resulted in service of that character becoming not only a trade asset and the basis of a National reputation, but a veritable business habit. Our endeavor has for so long been to never deviate from the standards of 100 per cent. excellence as laid down by those who founded this business, that it is practically a matter of impossibility for us to vary the quality of our goods without a complete reorganization over to a high-speed, quantity basis.

American Beauty Walnut

It is recognized by the discriminating trade that our service incorporates not only goods of the highest possible excellence, but thorough understanding of the customer's requirements in order that his share of our always choice selection of goods may be precisely what he prefers.

Our knowledge of customers' needs and our ability to exactly meet those needs, recommend our service to you as a careful and experienced buyer.

Is the Plywood Auto a Probability?

(Continued from page 90)

have not gone ahead as quickly as might have been anticipated, probably because the same condition has existed with them as with us, tthe ability to sell all they can make regardless of cost, construction or competition. It is very probable, however, that when the market is again a buyer's market, the refrigerator which is made of plywood and is therefore lighter and of better appearance will change the construction used in this industry materially.

Railway Car Manufacturers Hesitant

Car builders have gone into waterproof plywood to a considerable extent. They are a little slow in taking hold of it, because a good many of them have replaced plywood on car ceilings because of the poor result which they have had with panels made with non-waterproof glues and have substituted fibre, linoleum or other similar materials. Some of them are using plywood and using waterproof glue. The aircraft people are fairly active, particularly the flying boat or seaplane manufacturers, and as this country's program for aircraft will be of considerable size this year, there is quite a demand from this source. A sixty million dollar appropriation is expected. The German 'Albratross" which was sent to this country was made entirely of metal and although it was wrecked it showed wonderful strength in parts of its construction. Some are of the opinion that plywoods will not be the material used for aircraft construction in the future, but as far as our country is concerned, this is a long way off.

There are innumerable minor fields which have adopted waterproof plywood in an experimental way which include wire reel manufacture, sporting goods manufacture, outdoor top manufacture and one of the most unique is shoe manufacture. Our firm supplied a quantity of plywood to a concern which has made up its shoes of part plywood construction including soles and heels, the soles being made of five ply 3/8 in. birch and being so inserted in the shoe that when they wear out, they can be replaced by the wearer in a few minutes.

Returing to the furniture, piano, phonograph and similar trades, a very large number of manufacturers are using waterproof glues for jointing and veneering. The ability to use the glue cold, without having to heat the wood, together with the low cost of the glue compared with the hide glues has caused iits adoption in a very large number of plants. In the piano trade, and particularly the action trade, the waterproof quality has been the determining factor. Many of the larger door manufacturers are using waterproof glue for their outside doors and some on their entire production.

Producing Increased Volume of Veneers

Plant of Veneer Manufacturer Extended—Native Woods Worked Up Into Attractive Stock—Every Effort Made to Keep Down Manufacturing Costs

With a daily output of from 100,000 to 125,000 feet of material, the reorganized veneer plant of the National Lumber & Veneer Co., Indianapolis, Ind., is said to be among the finest on the continent. This plant was recently enlarged and new equipment added with a view to increasing the output and in some measure coping with the volume of business that is offering. The raw material is received at one end and progresses by the most direct route to the warehouse and shipping departments.

The output is confined chiefly to native American woods and comprises such lines as such as sawn and sliced plain and quartered oak, sliced walnut, half round and butts, cut on the half round. and poplar and gum-rotary cut. The manufacture of the veneers requires a heavy installation of modern veneer manufacturing equipment. The sliced stock is cut on a 16 ft. Capital slicer, while a special veneer saw takes care of the sawn product. A 125" Capital veneer lathe handles most of the rotary cut veneers and a special combination half-round and rotary machine works up the butts and half-round stock. The drying is done with the aid of two mechanical dryers 12 ft. by 120 ft. The stock enters green and wet at one end and after travelling the length of the dryer emerges dry and flat at the far end.

The equipment is all electrically driven. A boiler is installed and is used to heat the vats, dryers and buildings. A conveyor system is being installed to carry the bark and other waste material, suitable for fuel, to the boilers. The buildings are carried on concrete foundations of sufficient height to permit all motors, shafting and belts to be installed beneath the floors. This form of installation tends to reduce accidents and aids production by providing a clear floor space.

A market has been found, which takes the sawdust in carload lots. This material is conveyed by a blower exhaust system to a storage bin which has been constructed close to a railway siding. Most of this dust collection system is installed beneath the floor.

Veneer saws and long platform for lift trucks

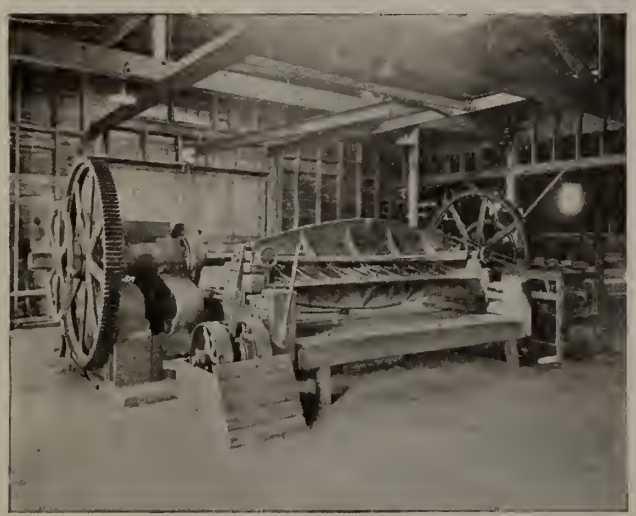
The raw material is brought in by rail and unloaded with the aid of a large electric crane. Indiana oak is used for the oak veneers. The flitches are unloaded on a platform which is in line with the veneer

saws. The logs for the other veneers are cut into lengths by means of a portable gasoline saw and the short pieces are then placed in the vats for steaming. The movement of the logs from the vats to the slicers and lathes is facilitated by the installation of a overhead carrier system. This system is fitted with powerful chain blocks and the logs are picked up and

Veneer slicer lighted by large skylight

conveyed to the different machines, where they are piled convenient to the operator.

The mechanical drying equipment is installed near the veneer cutting machines. As the veneers are cut they are fed into the dryers. After going thorugh the dryers the stock is piled on special platforms and lift trucks are employed in moving the dry material to the warehouse or shipping departments. For the long



Capital lathe for making rotary cut stock

stock the platforms are 12' long and the lift trucks 8' and 10'. Using platforms and transveyor trucks reduces the loss from breakage as well as lowering handling costs.

Provision, in the shape of large skylights, has been made for supplying a bountiful supply of light to each machine. This tends for high production and that production is maintained even on dark and dull days.

The personnel of the National Lumber and Veneer Co. is as follows: B. F. Swain, president; C. J. Roache, vice-president; E. O. Lange, secretary-treasurer; H. A. Hagerman, sales manager.

Overheating Weakens Animal Glue

That long continued heating reduces the strength of animal glue solutions is demonstrated by the following test made at the Forest Products Laboratory.

Solutions of a high-grade joint glue and a veneer grade glue were heated for 48 hours at 104, 140 and 176 degrees Fahrenheit, and tested every few hours during this period for strength and viscosity.

In the first 7 hours of heating at 176 degrees the veneer glue lost approximately one-half its joint strength, and the high grade glue joints weakened almost as much. The greatest loss in the strength of the glue joints made with the high grade glue after 31 hours of heating, due possibly to a combination of bacterial and chemical action. The veneer glue joints showed a more gradual decrease at this temperature. The most favorable of the three temperatures tried was 140 degrees, but even at this temperature an appreciable weakening in both glues was noted at the end of 7 hours, and longer heating caused greater loss.

The viscosity of the high grade glue declined more rapidly than that of the veneer glue, but at the end of the heating test the viscosity of the high grade glue still averaged higher than that of the veneer glue.

Covered glue pots were used in this experiment. When open glue pots are used the loss in strength caused by the heat is less apparent, since the loss is compensated to some extent by evaporation of the water. On the other hand, the concentration of the glue solution through evaporation is an expensive means of gaining strength.

Trimming Veneered Stock

A manufacturer of built up dash-boards for automobiles was confronted with the necessity of increasing his output. It was found that the trimming and sizing of the boards after veneering was a slow operation and was consuming an unnecessary amount of time. A double cut-off saw was installed to speed-up, but it was found that owing to the overhang of the face veneers and the lumps of glue which ran over the edge that it was difficult to make a true cut. This was overcome by driving a couple of finishing nails portway into the saw gauge. The core of the piece was placed against the head of the nails, giving a true cut. Four nails were used and two pieces trimmed at a time.

Moisture Content vs. Density of Wood

Even after long exposure to the same atmospheric conditions different pieces of wood do not have exactly the same moisture content, states the Forest Products Laboratory, Madison, Wis., as the result of recent tests. Variations of two per cent. were recently found in red oak blocks stored under carefully fixed humidity conditions at the laboratory.

These moisture differences, unlike variations in strength, are apparently independent of the density of the pieces. In the laboratory experiments the variation proved to be as great in blocks of the same density as it was throughout the lot of specimens. Moreover, the range in moisture content was the same in wood of low density as in wood of medium density or high density.

This question of moisture content is a most important consideration in the seasoning of airplane parts, of furniture stock and in similar wood manufacture.

Demand the Best

When it comes to Veneers, the best is none too good. That's why we carry nothing but A.1 grades at all times—it pays us better—it pays our customers better—and it pays the ultimate buyer of the finished products better. Right now we have for immediate shipment some excellent Crossbanding & Core Stock—Mahogany, Walnut and Oak. Come in and look it over, or have us submit quotations.

The Lumber Market

Domestic Woods

Weak, expresses the demand for Canadian woods. Midsummer is usually a quiet period, but whether it is quieter than usual is difficult to judge. Stocks are fairly plentiful and are in good shipping condition. The situation which exists in the American hardwood market is reflected in the Canadian lumber situation. This is largely due to the fact that the strong demand from the American market is practically non-existant. There is, comparatively speaking, very little lumber moving southward. The demand from Canadian manufacturers is stronger. There has been a reduction in ocean freights from 300,s, per standard to 200,s., with the prospect of further reductions. This has been brought about by the competition of the tramp steamers who have been quoting as low as 175, s. per standard. Just what effect this will have on the export of lumber is problematical. There has been a certain movement overseas, but at the present writing lumber is a drug on the British market. Should any of the large British building schemes be pushed a considerable quantity of lumber will be required. In Canada the speculative building is about over with or the season, and while a lot of construction work is being gone ahead with, building on a large scale can hardly be anticipated before next spring. All indications point to a fair crop. With plenty of money in the rural districts the rural demand for lumber should show improvement.

The softwood market is very easy. The strongest feature is white pine, which is holding firm. Spruce and hemlock have dropped slightly, largely due to weak call. American yellow pine is being offered at reduced prices and has something to do with the drop on hemlock and spruce. The cut in the Ottawa valley will likely be below normal. Several mills have been forced to close earlier than usual, through a shortage of logs.

The demand for hardwoods is what may be spotty. The planing mill men and trim manufacturers are buying freely. Very little is going to the American market. Brown ash is probably the strongest hardwood item. Birch is a trifle weaker but is not showing any sign of a big drop. Maple is plentiful but is not selling and is about the weakest item in the hardwood lists. Stocks of all woods are fairly plentiful and are in prime shipping condition. The demand during the next month or six weeks should be the biggest factor in determining the trend of prices.

Imported Woods

The American hardwood industry is experiencing the usual summer slackness. In addition other factors are likely contributing to this slack period. Many buyers, anticipating a strong break in prices, have refrained from buying, but it is doubtful if they will gain any advantage by holding back. The general opinion is that the stocks held by the wood users, are, on the average, well below normal and that when buying does commence, it will be in real earnest, with a large number of buyers in the market. Should this occur the result will be firmer and perhaps higher prices. The car situation is serious and does not show any signs of improving. It is effecting shipments of lumber to the consumer and in many cases retarding the delivery of logs to the mills. Increased freight rates and slow deliveries seem to be assured. The "Hardwood Record" in outlining the situation, says: "The money is still here and there still exists a stupendous necessity for goods. True the world is probably schooled to doing with less than formerly and is certainly most thoroughly convinced that it has been mulcted of much of its resources by exorbitant prices. However, when it is satisfied that the price level has been stabilized on a basis commensurate with actual worth it will again open its purse strings even if those values are higher than in the old days. That desirable condition is most certainly on the way, though it will be preceded by numerous bumps and jolts as the wheels seek the track. In the meantime lumber values are gradually seeking a level of values more truly expressive of intrinsic worth. Prices on hardwoods in general are not sliding precipitately because stocks are in strong hands, because buyers' supplies are low and because it is physically impossible to pile up any great amount of lumber. Sales are reported as having shown just a slight improvement of late and before the year is up the call for hardwood stocks will have increased one hundred per cent. Prices will not again run away, but they will again go higher."

The Chicago market is quiet, though there is a current of optimism running beneath the surface. Building activity is on the increase. It is the general opinion in that district that buying will be resumed shortly and on a large scale so that available stocks will be speedily exhausted.

Buffalo reports a slack period, with trade quieter than a few weeks ago. The car shortage is blamed for this condition. Some far-sighted buyers are not willing to risk the traffic congestion that appears probable for the fall and winter and are laying in some stocks. Maple is firm and in strong demand. Poplar and cypress are both popular. There is a fair demand for oak and ash, though not as strong as earlier in the season.

The Evansville market is fairly strong, with most lines in fair demand. Conditions are not as good as they were a few months ago. The trade outlook is reported encouraging. Prices are holding firm and if the opinion of the lumber men is worth anything, they will continue that way. The car situation has improved in this section and logs are moving in freely. Quartered and plain white oak are being bought up, in fact all oaks are being sought after. Walnut appears strong, while there are numerous enquiries for ash, poplar and maple. Good weather has helped the building situation.

The demand in the Louisville market is on the increase. The orders being placed are mostly for kiln dry stock and for immediate shipments. This would lead one to the conclusion that the stocks of the buyers are very low and they are buying for immediate use. This would confirm the opinion of many lumbermen. Some mills have about reached normal production, while others are forced to curtail operations for want of logs. The demand for mahogany and walnut is increasing. Poplar is exceptionally strong. Oak, ash and gum are moving freely. The market for veneers is showing a marked improvement, but it is doubtful if the veneer manufacturers have caught up with orders booked earlier in the season.

Taking it all in all, it does not appear as though prices will drop much further. Another month should give a good idea of how the market will likely move.

Improvements to the Knechtel Plant

The Knechtel Furniture Co., Limited, Hanover, Ont., have completed an addition which adds 27,000 feet to their floor space. The lower floor of the new addition is fitted up as a cooling and dry storage shed and has a capacity of 30 kiln cars. In addition four swing saws have been installed, making it a breaking out room as well. The top floor is fitted up as a finishing room and is equipped with the Sidman system of automatically-controlled heat, humidity and moisture. The whole plant is being electrified and numerous motors are being installed. The intention is to use electric power about eight months of the year. During that period the waste and refuse will be stored and will be used as fuel for power and heat during the winter months.

Woman to Recover Oak and Walnut Logs

Sunken treasure in Lake Erie is the goal of Mrs. Margaret C. Goodman of New York city, formerly of Detroit. But this treasure is neither gold nor silver. It is just logs. Nevertheless these logs constitute a fortune—they are a cargo of walnut and whie oak logs sunk in Lake Erie in 1859, when a three-masted schooner carrying them from a Canadian port went down with all hands save one.

Mrs. Goodman is the only woman in the world, it is said, engaged in deep sea salvaging. She organized the company that raised the copper cargo of the steamer Pewabic, sunk off Thunder Bay, near Alpena, before the Civil War. One single piece of copper in mass form recovered from the Pewabic was sold for $3,500. The amount recovered ran into a big total.

Estimating Quantity of Flooring

When estimating the amount of flooring required to cover a given area the following measurements may be considered as standard: ⅜ inch and ½ inch in thickness, all faces, is measured ½ inch waste for matching, ⅝ inch and thicker, all faces, is measured ¾ inch for matching.

To determine the number of feet of matched flooring required to cover a given area: Find the number of square feet of floor space to be covered, and add to this amount the percentage as indicated in the following table:

Finished face—1½ inches, 2 inches, 2¼ inches, 3¼ inches.

⅝ inch and 13/16 inch finished thickness—Add 50 per cent., 37½ per cent., 33-1/3 per cent., 24 per cent.

⅜ inch and ½ inch finished thickness—Add 33-1/ per cent., 25 per cent., 22½ per cent.

For ⅜ inch flooring, use 3d finishing nails.

For ⅝ inch flooring, use 6d finishing nails, and

Over or Underhung Saws?

Certain types of straight edging and jointing saws have the saws mounted above the table so that the bottom part of the saw does the cutting. This is, presumably, so as to secure a better arrangement of the endless bed feed. Are there any advantages or disadvantages with an overhung saw? Does the saw work better? Is it more accessable? Would there be any advantage in building the ordinary rip saw with an overhung arbor. A discussion on this question might bring out some interesting information.

Information and Inquiries

You are cordially invited to make use of this department

Coating to Prevent End Checking

St. Stephen, N. B., Aug. 3, 1920.

Editor "Canadian Woodworker":

We experience considerable loss through the end checking of lumber piled for air drying. Can you tell what we could use to coat the ends that would tend to prevent this checking?

Sincerely yours,
Haley & Sons.

Any coating that will tend to retard the rate of drying from the ends will tend to prevent checking. It is the rapid drying of the ends that causes the checks. The harder and greener the wood the more effective the coating must be. Paint is easy to handle and apply but is not very effective. The same applies to white or red lead. Rosin-lampblack is not so convenient to handle but is very effective in checking end drying. This mixture is made by melting rosin (60 parts) and stirring in lampblack (1 part). This mixture must be applied hot, either by brushing or dipping the ends.

Market for Hardwood Waste

Victoriaville, P. Q., July 20/20.

Editor "Canadian Woodworker:"

We manufacture a line of hardwood flooring and find that we have to burn as waste a lot of ends and cuttings running from 5 in. to 15 in. in length. Reading your offer in the June issue of your paper we would ask if you can suggest some way of disposing of these cuttings.

We would also like to have some data on clothespin manufacturing, such as machinery required, probable cost, power needed, market, etc. Thanking you for any information you may give.

Yours truly,
Lavasseeur & Fortier, Ltd.

It is rather difficult to name off-hand some article that you could make from the trimmer ends you mention without knowing the equipment you have and also the market there might be for such an article. At the present time there is a strong demand for wooden toys and building blocks of all kinds, and it is just possible that you could make this stock to advantage by making some kind of toys. Then again,, you might be able to dispose of the blocks to some firm who makes toys, handles for paint brushes or some such small article from hardwood. We know of several cases where a market of this kind has been found.

If the flooring you manufacture is from such woods as birch, beech and maple, your suggestion of making clothespins is a good one. Clothespins are in strong demand at the present time and are commanding good prices. The equipment required would be suitable saws for sizing and equalizing, that is, cutting to length the stock for the clothespins. Then you would require an automatic clothespin lathe and, probably, an automatic clothespin slotter. As the stock you would use would be dry, you would not have to dry the finished pin, but it might be advisable to run the pins through a tumbler so as to polish and smooth them up.

We believe that H. W. Petrie, Limited, of Toronto, have some clothespin lathes and slotters in stock; in fact they were listed in their ad on page 114 of the June issue. We cannot give you any data regarding the cost of this equipment or the power necessary to drive it but think that the power required would not amount to very much, probably 20 h.p. If there are any other questions you would like to ask, we would be glad to have you write.

Shoe Shank Equipment

Referring to an enquiry published in the July "Canadian Woodworker," regarding the equipment needed to manufacture wood shoe shanks, this equipment does not seem to be on the market. One large manufacturer of shanks states that the machinery they use is manufactured by themselves and they believe that other manufacturers of shanks are using specially designed machines.

As near as can be learned these shanks are made from blocks and are cut on a lathe having a curved knife, which conforms to the shape of the shank, following the same idea used in manufacturing rotary cut veneers. The long strips are then cut, on clippers, to the desired width. It is difficult to suggest a method for bevelling the inside edges as this is production work and must be handled expeditiously. The suggestion has been made that a bent shank could be stamped out of rotary cut veneer, using dies that would give the shape and press the bevels at one operation. These dies would possibly have to be kept warm. This is only a suggestion and should not be taken as a practical method.

Information on Equipping Planing Mill

A subscriber writes stating that he is considering remodelling his planing mill and wishes information that will enable him to install an efficient, up-to-date, labor-saving plant.

Without knowing the size of the plant and lines to be manufactured it is difficult to give any practical suggestion. Each issue of the "Canadian Woodworker" contains ideas that could be applied to a planing mill and which if adopted should assist in reducing costs and conserving labor. The modern idea is to decide on the equipment and layout then build to suit. Working this way an ideal layout could be sesuit. The articles entitled a "Better Way to Build Your Plant" which appeared in July and August numbers, contains suggestions along this line. A labor-saving overhead carrier system was outlined in the February number while the April and May issues contained description of planing mills. Ball bearing hangers and machines would mean a lower power bill. Perhaps some form of electric drive could be used to advantage. The two most important items are securing modern, labor-saving, production machines and then placing them so that handling and trucking is reduced to a minimum.

Putty is succeptible to certain acids or sodas. To remove hard putty from an article, first soften the putty with a weak solution of caustic soda or potash. If these items are not available apply nitric or muriatic acid and allow to stand for about an hour.

May We Make This Suggestion?

To those buyers whose requirements of hardwood lumber, rotary veneers and panels it has been our privilege to serve and to those others who we hope to serve in the future, we would like to frankly and in friendliness advise that bad as the car situation is to-day, it is bound to be infinitely worse in a month or two. Therefore, to insure delivery and avoid the 30 or 40 per cent. increase in freight rates, due about September first, we earnestly counsel buying now.

May we suggest also that our friends should not reckon too strongly on much lower prices? It is true that the present tendency is downward, but while the southern forests are now pretty well dried out, the almost total impossibility of getting cars is keeping millions of feet of logs in the woods, where vast quantities are rapidly deteriorating. A goodly portion of this accumulation probably never will reach the saw mills. Thus, while one adverse condition is out of the way, another immediately takes its place, and though southern manufacturers have succeeded in making one spurt in production, the average mill stock in the south is still dangerously low. The consequence of such condition has been brought home with force to buyers in the past eighteen months.

This is but a friendly suggestion offered only because we think it absolutely true. Therefore, if you possibly can, buy now. As to price, our only assurance is that now as always, our policy is to give full value for every dollar invested with us.

News of the Trade

The Andrew Gray Upholstering Co., Toronto, contemplate moving to Owen Sound, Ont.

The Hillsborough Woodworking & Mfg. Co., Limited, Hillsborough, N. S., are installing a dowel machine.

The Kindel Bed Co., Limited, Stratford, Ont., are installing a Grand Rapids Vapor Kiln.

The plant of Clement, Meunier & Co., Montreal, P.Q., showcase manufacturers, was recently damaged by fire.

The Aetna Broom Manufacture was recently incorporated in Montreal with James O'Sullivan, proprietor.

The planing mill of the Canadian Woodworking Co., Limited, Yarmouth, N. S., was recently destroyed by fire.

Gustave Champagne, Montreal, P.Q., has registered as a pail manufacturer under the name of Cie La Daisy.

The Canada Floor Lamp Co., Montreal, P. Q., has been dissolved.

The Mechanics Tool Case Mfg. Co., Toronto, has been registered.

Flynn & Senecal, Montreal, P.Q., woodworkers and furniture manufacturers, were recently registered.

The plant and equipment of R. G. Taylor, Limited, Winnipeg, Man., trunk manufacturers, was destroyed by fire.

The partnership known as the Standard Broom & Brush Co., Montreal, P.Q., has been dissolved.

Mills Bros., Port Hope, Ont., recently installed a plant to manufacture canoes, boats, toys and other articles of wood.

Weyburn Sash and Door Factory, Limited, Weyburn, Sask., were recently granted a provincial charter to operate a sash and door factory. Capital, $20,000.

The cigar box factory of L. O. Grothe, 556 Lawrence Blvd., Montreal, which was recently destroyed by fire, at a loss of $20,000, is being rebuilt.

The Columbia Handle Co., London, Ont., have started the excavation for their new factory. The completed building will cost in the neighborhood of $25,000.

The Port Hope Lumber & Veneer Co., Port Hope, Ont., have taken a contract to manufacture a large number of 11-quart fruit baskets.

Cyprieu Lauziere is making improvements and extensions to his carriage factory at St. Leonard D'Aston, Que., at a cost of $3,000.

The newly-formed Northwestern Box Co., Limited, Vancouver, B.C., has taken over the business conducted by Dallmore & Morrison.

The partnership known as J. G. Ewing & Sons, Melbourne, P. Q., proprietors of a sash and door factory, has been dissolved.

The partnership known as The Montreal Stuff Over Furniture Co., has been dissolved and J. Moscovitch registered as proprietor of the business.

R. Herbison, proprietor of the Peterborough Planing Mill, Peterboro, Ont., reports that business is very good. He recently accepted a contract for a large number of wood toys.

The Knechtel Furniture Co., Limited, Hanover, Ont., are installing a two-unit Sidman lumber curing kiln and are laying out a kiln car storage yard for their lumber.

Swapped occupations. Jas. Paquette, Hawkesbury, N.S., sold his sash and door factory to Oliver Menard, butcher, and purchased Mr. Menard's butcher business

A blaze broke out in the Regina plant of Cushing Bros. & Co., Limited, Calgary, Alta., but was extinguished before much damage was done.

The Gem Mfg. Co., Amherst, N. S., recently secured a plant to engage in the manufacture of furniture and store fixtures.

Sherman Cooper, who operates a planing mill in Cobourg, Ont., recently added some box-making equipment in the shape of a circular resaw, cut-off saw and boxboard matcher.

The Peterboro Canoe Co., Peterboro, Ont., have enjoyed a very busy season. Canoes and boats are in strong demand for export and several large shipments were made to Great Britain and other countries.

Petheram's mill at Port Hope, Ont., was recently taken over by Speirs & Tye. This plant consists of saw, planing and grist mill. Speirs & Tye report that business is good with a fair amount of work offering.

The planing mill of Robertson Bros., New Glasgow, N. S., was totally destroyed by fire. The loss amounts to $50,000. It is probable that this plant will be rebuilt at an early date.

The Hardwood Chair Co., Limited, Vancouver, B. C., were recently incorporated, with a capital of $10,000, to take over, as a going concern, the plant and assets of the Hardwood Chair Co.

The Bell Furniture Co., Limited, Southampton, Ont., are making a few improvements to their power plant and are installing one unit of a battery of Sidman kilns, including an up-to-date transfer system, cooling shed and kiln yard.

The Williams Piano Co., Limited, Oshawa, Ont., have installed a Taylor clamp carrier in their piano factory. The A. R. Williams Machinery Co., Toronto, are the Canadian representatives for this clamp carrier.

George Menzies, secretary of the Board of Trade, Owen Sound, Ont., has a list of mechanics in Great Britain who are desirous of securing employment in Canada. Employers in need of mechanics might write Mr. Menzies.

Lightning recently struck the smoke stack of the Waugh planing mill at Niagara Falls, Ont., tore off the top and opened a crack all down the side. A heavy steel furnace door was thrown a distance of fifty feet. No one was injured.

Bell-Baldwin Hydromes, Limited, Baddeck, N.S., were recently incorporated to manufacture and deal in hydroplanes, hydrodromes, boats and other water craft. Capital $5,000. Two of the incorporators are J. S. Lovell and W. Bain, accountants, both of Toronto, Ont.

E. O. Webber, Limited, Waterloo, Ont., have been incorporated to conduct a general furniture business as wholesalers, retailers and manufacturers. Capital $500,000. E. O. Webber, R. A. MacGillivray, manufacturers, both of Kitchener, Ont., are two of the incorporators.

The Canadian Mathews Gravity Carrier Co., Limited, Port Hope, Ont., report that their gravity carrier system is finding favor with the furniture manufacturers and other woodworkers, many installations having recently been made in this class of plants.

The Sturgis Baby Carriage Co., Limited, Toronto, Ont., were recently granted a provincial charter to manufacture and deal in go-carts, baby carriages, and all kinds of children's vehicles. Capital, $40,000. Among the incorporators are D. I. Grant and M. MacDonald, both of Toronto.

Wiggily Toys, Limited, Toronto, Ont., were recently incorporated to manufacture and deal in toys, bric-a-brac and other novelties. Capital $40,000. J. Harley and E. Sweet, barristers, both of Brantford, Ont., are two of the incorporators.

The Dominion Music Company, Limited, Montreal, Que., was recently granted a provincial charter to manufacture and deal in phonographs, gramophones and other musical instruments. Capital $50,000. J. P. Martin and J. Thibault, both of Ottawa, Ont., are two of the incorporators.

Halifax Shipbuilding Company, Limited, Montreal, Que., was recently granted a federal charter to manufacture, construct and deal in steamships, barges and other water craft. Capital, $100,000. F. H. Markey and W. W. Skinner, both of Montreal, are among the incorporators.

Fire destroyed the plant of McEachren & Sons, sash and door manufacturers, Alvinson, Ont. The loss amounted to about $10,000. Plans have been prepared for a new factory, which is to cost about $20,000. The above firm are in the market for some equipment.

The special suite of furniture built for H. R. H. the Prince of Wales, by the T. Eaton Co., and used by him during his stay at Government House, Toronto, has been purchased by the management of the new Pantagis Theatre, Toronto, and will be installed on the mezzanine floor.

Thomas Meadows & Co., Canada, Limited, Montreal, P. Q., have been incorporated to manufacture and deal in aircraft, boats and all kinds of vehicles. Capital, $50,000, Among the incorporators are H. W. Vaughan and C. B. McCallum, both of Toronto, Ont.

Dominion Snath Company, Limited, Waterville, P. Q., have been incorporated to manufacture and deal in scythe snaths, cradle handles and all kinds of wood turnings. Cap-

ital, $75,000. Two of the incorporators are H. S. Ball of Waterville, and F. S. Rugg, K.C., of Sherbrooke, P. Q.

The doors and interior woodwork for the new technical school which is being constructed at Fort William at a cost of $250,000, has not as yet been purchased. George Coo is secretary of the Board of Educatiin at Fort William, and R. E. Mason, Victoria Block, Fort Wililam, is architect for the school.

The plant of J. P. Abell, Fortin Co., Limitee, Montreal, P.Q., box manufacturers, was recently destroyed by fire, causing a loss estimated by an official of the company at about $25,000, partly covered by insurance. The origin of the fire is unknown. It is expected that construction work will be started on a new plant in a few weeks.

There is a possibility that a car factory may be estabilshed in Toronto in the near future. A representative of a large English organization has been looking over the ground with this end in view. It is also reported that the plant of the Dominion Shipbuilding Co. will be converted into a car factory as soon as the company can be re-organized.

W. W. O'Hara, Limited, Montreal, Que., was recently incorporated to take over the business known as W. W. O'Hara & Co., and to manufacture and deal in pianos, organs, phonogrophs and other musical instruments. J. MacNaughton and W. W. O'Hara, both of Montreal, are two of the incorporators.

In an effort to relieve the shortage of fruit baskets, which has caused a loss to many fruit growers, the Norfolk Co-operative Association contemplate equipping a basket factory to meet the requirements of its members. According to J. E. Johnson, manager of the Association, this appears to be the only remedy in sight.

Office Requirements, Limited, Sherbrooke, P.Q., was recently granted a federal charter to manufacture and deal in all kinds of office furniture also paper preparations such as paper bags and cardboard boxes. Capital, $50,000. Two of the incorporators are K. Forrest and J. R. Forrest, both of Sherbrooke, P. Q.

Work on the new furniture factory of the Langslow-Fowler Furniture Co. at Cobourg, Ont., is progressing rapidly. The first unit, which is a two-storey brick building, 60 x 220, with separate power house and kiln, is rapidly nearing completion. A two-compartment Standard dry kiln is being constructed. It is anticipated that the new plant will be in operation about October 1st.

Aylmer Products, Limited, Aylmer, Ont., have been granted a provincial charter to manufacture and deal in motor trucks, carriages and other wooden vehicles, and to take over as a going concern the business known as the Aylmer Pump and Scale Co.. Capital $500,000. D. I. Grant and A. Dodds, barristers, both of Toronto, Ont., are two of the incorporators.

Foster, Merriam and Company, Meriden, Conn., have recently been granted a charter to do business in the Province of Ontario provided they do not use capital in excess of $20,000. The company manufacture and deal in furniture casters, trimmings and hardware. Victor Grantham of Hamilton, Ont., has been appointed the company's representative.

According to a St. Johns, Newfoundland, report a large organization, backed by British and American capitalists, is erecting a large saw and pulp and paper mill at St. George's, Nfld. The plans of this company include the construction of two veneer mills, to manufacture birch veneers, and a box and barrel factory. The pulp and paper will be imported to Britain and the U. S., while the boxes, barrels and veneers will be sold locally as well as exported.

In giving evidence before the Board of Conciliation at Ottawa, Grant P. Davidson, manager of the James Davidson's Sons & Co., declared that, in his opinion, the demands of the men were exorbitant and that the company could not stand the added financial burden which would ensue if their demands were granted. He stated he would be glad to turn the whole plant over to the men and allow them to operate it if they would guarantee a return of 5 per cent. on the capital invested.

The agreement under which John Stirrett & Sons, Port Arthur, Ont., will take over the plant of the Port Arthur Wagons & Implements, Limited, has been ratified by the Port Arthur city council. The new owners agree to employ 125 men and have the factory in operation within sixty days. The price involved in this transfer is said to be $270,000. The plans of the new company include a box factory and, if possible, large pulp mill.

Personals

R. B. Elgie, of the Elgie and Jarvis Lumber Co., Toronto, and family, are spending a vacation at the Woodington House, Lake Rosseau, Muskoka.

Wm. Cawkill, Toornto, the energetic and capable secretary of the Furniture Manufacturers' Association, is spending a well earned holiday at Renfrew, Ont., and vicinity.

Col. H. P. Howard, recently of the U. S. Army, has been appointed assistant secretary of the National Association of Box Manufacturers, 1553 Conway Bldg., Chicago.

A. Farrel, an employee of the Thessalon branch of Firstbrook Bros., Limited, box manufacturers, had the misfortune, recently, to break his arm while discharging his duties in the plant.

Benjamin G. Robinson, formerly with the Guelph Lumber Co., Guelph, Ont., is in charge of the Peterboro plant of the Canadian Aladdin Co., Limited. T. W. Oke, formerly proprietor of the Peterboro Furniture Co., is the shop foreman.

J. F. Field recently returned to Collingwood, Ont., after an absence of forty years, to visit familiar scenes and renew old acquaintances. Mr. Field is now president of the Field Body Corporation, which specializes in auto and truck bodies. This business, which has assumed large proportions, was built up from a small beginning by Mr. Field.

A. E. Switzer, the energetic sales manager of the Martin-Orme Piano Co., Ottawa, Ont., has severed his connection with this firm to join the firm of Switzer Bros., piano dealers, Vancouver, B. C. At a farewell dinner given at the Laurentian Club, Mr. Switzer was presented with a reading lamp as a token of the esteem in which he was held by his associates. The presentation was made by Mr. Mathew Orme.

W. J. Lovering, of Toronto, returned lately from a four weeks' trip to British Columbia. He states that the western crops look well and a record yield is looked for which should result in a good demand from the prairies for B. C. forest products. Several shingle mills which were closed down, have resumed, and while business with several sawmills was quiet, there is a belief that general activity will, in the near future, reassert itself in the lumber line.

Obituary

Robert Heard of St. Thomas, Ont., recently passed away at the age of 87 years. Mr. Heard was engaged in the wagon business for about 35 years.

Henry G. Steins, London, Ont., recently passed away at his home in that city. Mr. Steins was born in Waterloo in 1844, later moving to London, where he engaged in the cooperage business.

Reeve McKinley, pioneer wheel and spoke manuafcturer, recently passed away at his home in St. Catharines, Ont., at the age of 90 years. Mr. McKinley had been in the wheel and spoke manufactuirng business the greater part of his ilfe.

B. Jamieson, of the firm of R. C. Jamieson & Co., Limited, varnish manufacturers, Montreal, recently passed away at his residence after an attack of heart trouble. Mr. Jamieson was 75 years of age and had resided in Montreal for the last 40 years. He is survived by Mrs. Jamieson, two sons and two daughters.

Our Kraetzer-Cured Gum is guaranteed to be practically ***flat, straight*** and ***bright.***

Band Saw in Pattern Shop

Pattern makers are, as a rule, accustomed to allowing considerable material beyond the finsh line when employing the band saw to cut out wooden parts. This practice makes it necessary to spend considerable time in finishing the parts down with hand tools, such as the plane or chisel, when, as a matter of fact, the required finish could be obtained by sawing up to the line. It may, nevertheless, be difficult to convince some pattern makers that this can be done unless they are afforded an opportunity of seeing the practical application of this method.

The benefit to be derived from a properly cared for and operated band saw in the pattern shop may be illustrated by the following experience of the writer. The manager of a certain pattern shop contracted to make several thousand pieces in wood, basing his price on the assumption that the work would be all performed on the band saw, but when the patternmaker was confronted with the work, he decided that the only satisfactory method of producing the pieces would be to cut them out first on the band saw to approximately the correct size and shape, and afterwards finish the pieces accurately by means of a cutterhead especially designed for this purpose.

The work proceeded satisfactorily in this way until the band saw broke. As it was necessary to maintain the output, the material and "finished size" templets were sent to a furniture factory near by, where the work was continued, but in a different way. The band-saw operator in the furniture factory, knowing nothing about the finish allowance or the cutterhead, cut the pieces out to finish size directly with the band saw, eliminating all additional hand-finishing work. When the foreman found out how the work was being done, and that the parts could be assembled satisfactorily, he became convinced that with the right kind of a band saw, operated by a careful workman, it was possible to cut right up to the finish line and thus avoid unnecessary hand fitting.

In order to keep the band saw in good condition so that it may be used for accurate work, the following rules should be observed:—(1) Always use a roller saw-guide and never a stationary one. (2) Make sure that the saw is only just permittetd to touch the roller lightly. (3) Use a ¼-in. saw for cutting light as well as heavy stock. (4) Never use saws which are kinked, bent or humped at the brazed joints. (5) Test the truth of the saw for cutting square by sawing a 3 in. diameter cylinder from a piece of wood 6 in. thick, an operation which cannot readly be performed with a wide saw, or one that is incorrectly set or filed. (6) See that the bands on the wheel are never allowed to become gummed. (7) Oil every sliding bearing and journal bearing each morning.

Credit Where Credit Due

Don't think because the other fellow employs different methods in veneering, that your ways of doing things are necessarily the better. We can all learn from each other and should be broad enough to realize that there are ideas in every system which if properly applied might result in improving your methods. Give the other fellow credit for a few good ideas and see if you cannot learn from him.

Opens Chicago Sales Office

The James E. Stark & Co., Inc., Memphis, Tenn., manufacturers of Southern hardwood lumber and sawed veneers, have opened a sales office under the management of E. M. Slattery, at 29 North Dearborn St., Chicago, Ill. Mr. Slattery has had six years' sales experience with the Stark Company, which, coupled with a practical knowledge of lumber gained at the mills, makes him particularly well equipped to render efficient service to the many customers of this company. The rapidly-increasing volume of business made the opening of this office imperative in order that they might better serve their customers. The James E. Stark & Co. now own and operate two modern band mills, one at Memphis and one at Dyersburg, Tenn., with a third big mill under construction at Memphis. When the three plants are in operation, they will have a daily output of 125,000, with a dry kiln capacity of, approximately, 1,000,000 per month. In addition, a modern veneer plant is operated on oak, cypress and gum veneers.

Woodworker Issues Booklet

An interesting and artistic booklet was recently issued by James Davidson's Sons, Ottawa, Canada. It is called "Davidson's Portable Cottages." There are shown pictures of the manufacturing plant in Ottawa, the company's sawmill at Davidson, Que., photographs of the late James Davidson, (the founder of the business), and his two sons, Grant P. Davidson and Lieut. Keith Davidson, who are directing the large enterprise. The leading characteristics and special features of Davidson's portable houses are pointed out and a number of illustrations given, not only of cottages but of hunters' cabins, churches, garages, hen houses, dog houses, refrigerators and other accessories.

The firm lately put out a most complete and neatly bound catalogue of sash, doors, blinds, boxes and shooks. The illustrations are particularly well executed, the grouping is effective and a vast amount of data is presented on doors, blinds, portable houses, sash, etc. James Davidson's Sons announce that their slogan is "from tree to finished product." They cut the logs and saw the lumber into doors, sash, blinds, etc., which enables them to meet adequately the requirements of the trade.

Making the Most of Our Time

Why is it that the busy man is always asked to do the big things in this life? Is it not because he is the only one that can find time to do just a little more work? The average man wastes three or four hours daily and never has time for anything. The great question is not "How much time have we " for we all have the same amount, but "What shall we do with it?" Most of us are letting this priceless gift slip away from us from day to day because we have no plans or system of doing anything worth while. When one sets himself to lead a useful life he is always busy.

The Emery Wheel and the File

Somebody has figured that it costs 62 cents to remove a pound weight with a file and only 8 cents with an emery wheel, and that the latter process requires only one-eight of the time of the former. However, the file can do some things which cannot be done with an emery wheel.

Hardwoods

Labor conditions and tight finances are making the lumber supply shorter than anticipated for the Fall trade. These conditions, together with a shortage of cars and an inevitable increase in freight rates of 25 to 30% should induce our customers to place their orders with us now, covering their Fall needs, and the stock will be shipped promptly—you will have it at your factory when you want it, and at lower prices than it can be purchased later.

Special Announcement

of Interest to Manufacturers

We have just purchased the entire plant of The Aldrich & Hyndman Company of Palmerston, Ont., and offer a complete unit of machinery for manufacturing washing boards; complete unit for manufacturing croquet sets, including a Ball turning lathe; complete unit for manufacturing trunks, including a No. 10 Morgan Nailer; complete unit for manufacturing children's sleighs.

Some manufacturers might want to add these lines to what they have, and we can offer good bargains.

In this plant are a lot of woodworking machines, such as band saws; single spindle and multi-spindle boring machines, rip and cross-cut saw tables, planers, moulders, dowel machines, variety lathes, routers, re-saw presses, box printer, paper cutter, iron punch, riveting machine 36-in. shear, splendid dry kiln apparatus.

Home Shortage is Building Problem

Recent investigations of the home shortage by United States building experts disclosed that building activities generally were confined to business structures. Commenting on this investigation, S. W. Strauss said:—

A shortage of homes, which is continually becoming more acute constitutes the outstanding feature of the present building situation throughout the nation. Preliminary statistics for the first seven months of the current year indicate that less than 20 per cent. of the money spent on the nation's building programme was for residential structures, while normally about one-third of the building outlay goes into homes of various types.

The constantly increasing shortage of dwellings offers one of the gravest problems. Overcrowded living conditions, accompanied by constantly increasing rents, are bound to result in lower standards of living and continued social unrest.

In solving the problem of the present period of readjustment it would seem that the first and most important step is to find means of bringing about improved housing conditions. It will take a long period of years to restore the correct balance between supply and demand, and everything possible should be done as a start in this direction.

Judging from current statistics, legislative efforts that have been made to help the situation have not generally resulted favorably, for it is apparent that a great deal of capital is being diverted from residential types of construction to business buildings. These problems should be given close study by the people. Capital, labor and materials are the three prime essentials, and building problems should be studied with a view of preventing diversion of any or all of these elements from home construction to other forms of building activity.

There is at present a world-wide shortage of homes and it is not unlikely that there is some connection between this condition and the general unrest, under-production and lack of thrift that exists. In this country housing facilities have been growing more inadequate for the past four years. Last year for example, only 70,000 homes were constructed, although the shortage at that time amounted to 500,000 houses.

With the 1920 building season now more than one-half gone, it is not expected that any marked improvement can be made this year. Every process of education and enlightment should be put in force immediately to the end that the significance of the present serious condition shall become thoroughly understood by the people. A campaign of education on the fundamentals of the building situation is one of the great needs in America today.

The Building Situation in England

The government subsidy of 250 Pounds or $1250 per house can be secured also for temporary wooden structures provided they cover not less than 700 sq. feet.

For the housing schemes, much English timber is being used, except for joinery purposes. Housing schemes in Great Britain are not yet sufficiently advanced for heavy quantities to be required in construction, although orders are plentiful for manufactured wood.

The market for American and Canadian lumber shows little improvement. It is not so much a question of price as of lack of demand. Every month shows an increased quantity of mining timber coming to the United Kingdom from France while there have lately been increased deliveries of home-grown mining timber.

Not a little of the present depression is said to be due to the uncertainty prevailing as to the future of transportation. The probable increase in British freight rates makes the future grading of prices of such a commodity as lumber very problematical and difficult and merchants in general are suspending purchasing for forward delivery. The general opinion throughout the timber trade, however, is that a period of slow recovery and increased prosperity will follow immediately on the present stagnation.

It was stated in Parliament in the early summer by the Minister of Health that the number of disputes in the building trade had delayed construction of houses. Present rates of wages, he said, varied in different districts from the equivalent of 30 cents to 57 cents per hour, the corresponding range in 1914 being 14 cents to 23 cents per hour.

General Carriage Woodworking and Smith Shop Machinery for Sale

The closing of our carriage plant has necessitated the sale of the following machinery, which we offer for immediate sale and subject to prior sale, all f.o.b. Chatham, as follows :—

12 No. 4 Boring Machines, Flexible Shafts	Stow Co., Binghampton, N. Y.
1 2-wheel Emery Stand	No Name
1 2-wheel Emery Stand, 1¼ in. x 22 in. Arbor, 3½ in. x 3 in. Iron Pulley, 15¼ in. wide, inside Wheels	Builders Iron Foundry, Providence Bay, R. I
1 Tire Bending Machine, Iron Frame, Capacity 4 in., 18 in. x 6 in. Wood Drive Pulley, 18 x 3 Iron Loose Pulley	Williams, White & Co., Moline, Ill.
1 Iron Brace Former for Bench, with Crank Handle	No Name
Lever Bulldozer Hand Iron Frame	No Name
Alligator Shears, 5 in. Jaw, 12 in. x 4 in. Iron Drive Pulleys, 24 in. x 4½ in. Flywheel	Badger State Machine Co., Janesville, Wisc.
Rolling Machine Hand, 3 in. x 28 in. long	No Name
Screen Boring Machine, 4 Spindle, Horizontal on Wood Frame, No. 30 Drills	No Name
Special Wood Frame Chain Sink Machine, for No. 11 Wire with 3/16" 12 roll Wire Straightener	John Adt & Son, New Haven, Conn.
Special Wood Frame Chain Link Machine, for No. 9 Wire for Elevator Chain, Wood Pulley	No Name
Chain Stretcher, Double, with tight and loose Pulleys	No Name
Geared Power Seamer, on Sqr. Pedestal Base, 18 in. depth of Throat, 18 in. x 3 in., flanged Drive Pulley	Pettengell Machine Co., Amherstburg, Mass.
No. C22 Power Wiring Machine 16 in. x 4 in. Friction Drive Pulley	C. M. Yoder, Cleveland
No. 312 Axle Cap Fitting Machine 10 ft.	Bentel & Margedant Co., Hamilton, Ohio
Iron Frame Power Beading Machine, 17½ in. depth of Throat, 12 x 3 T. & L. Pulleys	No Name
Pendulum Foot Power Press, on 3 legs, 6 in. depth of Throat, adjustable stroke	Park Bros., Chatham
Power Folder, Hand, Special 20 in. long	Brown Boggs Co.
Power Folder, Hand, 20 in. long	Brown Boggs Co.
Power Cup Former, Foot, Special	Brown Boggs Co.
Power Bench Punch Press, 10 in. Throat, 12 in. wide, 1 die, 6¾ x 6¾ in., 36 in. x 4 in. Fly Wheel	Park Bros., Chatham
3 Blacksmith Hammers, Cast Iron Frame, Foot Power	A. Standish, Columbus, Ohio
Drum Sander, Iron Frame, 12 in. x 20 in.	No Name
Iron Frame Jointer, with Endless Power Feed, complete	Jackson Cochrane Co., Kitchener
Paint Mixing Machine Complete	J. H. Day Co.
Small Post Drill	MacGregor, Gourlay Co.
Buzz Planer, 12 in. Knives, 18 x 74 Table, Iron Frame and Table	Cowan & Co., Galt
Mortice Machine, Hollow Chisel Bit, No. 20610 Adjustable Table	Greenlee Bros., Chicago
Double Spindle Shaper, 39 in. x 52 in. Cast Iron Top and Frame	J. Ballantine & Co., Preston, Ont
Disc Sander, 35 in. Dia. 50 in. x 50 in. Table, Iron Covered, Wood Frame	No Name
No. 119 Band Saw, 30 in. Rubber Tired, 30 x 33 Iron Bevelling Table	A. R. Williams Mach. Co., Toronto
Sticker, Iron Frame, 4 side	J. A. Fay & Egan Co., Cincinnati, Ohio
Single End Tenoning Saw, Iron Frame, Sliding Table, Spindles for 11 in. Vertical & 2-10 in. Horizontal Saws	MacGregor, Gourlay Co., Galt, Ont.
Wheel Machine for Tightening Nuts and Cutting Bolts, Automatic with Cast Iron Bed. T. & L. Pulleys.	Genesee Iron Works. Flint, Mich.
52 in. Capacity, Wheel Tire Setter, Hydraulic, with Double Plunger Power Pump Complete	West Tire Setter Co., Rochester, N. Y
No. 4 Tire Welding Power Press and Shear	Long & Allstatter Co., Hamilton, Ohio
Special Double Spindle, Vertical Rim, Drilling Machine on Iron Pedestal, Lever Feed	No Name
Wood Rattler Box, 20 in. Dia., 4 ft. long, 2 in. Staves, Iron Lined, 36 x 8 in. Wood Drive Pulley	No Name
Special Wood Frame Spoke Clipping Machine	No Name
30 H.P. Motor, "Burnt Out," Direct Current, 220 Volt	Electric Construction Co.
2 Swing Scale Testing Beams, 5 ft. Jib, 4 Wheel Traveller and Lifting Lever	No Name
Double Crank Straight Side Perforating Press, 32 in. wide inside Columns, with 36 in. 2 roll Automatic Feed Attachment, back and front, 48 in. x 8 in. Flywheel	J. Bertram & Sons Co. Dundas, Ont.
10 Dies for above Press, 7/32"", ¼", ⅜", 5/64", 7/64", 9/64", 3/32", 17/32", ½", 5/32" perforations, 24 in. long	J. Bertram & Sons Co.
Hub Boring Machine, 54 in. Wheel Capacity, Iron Frame	H. A. Moyer, Syracuse, N. Y.
Belt Sander for Iron, 5 in. Iron Frame, 6 in. wide pulleys and screw tighteners	No Name
Band Rip Saw, 42 in. Wheel, Automatic, 24 in. capacity, 42 x 42 Cast Iron Table & Fence, Tight & Loose Pulley and Outboard Bearing	J. A. Fay & Egan Co., Cincinnati, Ohio
Set 3 rollers for Metal Bench, 1¾ in. x 38 in. long	Brown, Boggs Co.
Hand Power Circle Shears	Brown, Boggs Co.
6 Small Hand Power Crimping Beading Grooving & Turning Machines	Brown, Boggs Co.
Blacksmith Bolt Header and 3 sets Dies, ¼ in., 5/16 in., ⅜ in.	No Name
No. 77 Bow Shaper & Cutter with Countershaft Special Machine	Buob & Schew Cincinnati
Saw Stretching Machine, 10 in. throat	Baldwin, Tuthill & Bolton, Grand Rapids, Mich.
Special Wheel Painting Machine, 60 in. Dia., Galv. Iron, Revolving with Brake & 15 in. x 3½ in. Tight & Loose Drive Pulleys	No Name
Wood Beam, Horizontal Hammer, No. 2, No. 40, Rubber Cushioned	Bradley & Sons Syracuse, N. Y.
Small Iron Bed Post Drill	No Name
2 Spindle Shaper, Adjustable Spindle, Iron Table and Pedestal	Battle Creek Machine Co, Battle Creek, Mich.
No. 5 Foot Power Mitering Machine	
Belt Driven Geared Cutting-off Shear, 7 in. Throat, 5 in. Shear	A. R. Williams Mach. Co.
4-500 lb. Weights for Testing Scales	No Name
4-250 lb. Weights for Testing Scales	No Name
1-50 in. x 1½ in. Thick Wheel Straightening Plate with 18 in. hole in centre	No Name
Power Punch Press 6 in. Throat, 35 in. x 4½ in. Fly Wheel	London Machine Tool Co., Hamilton, Ont.
1 Tinsmith's Bench Stake, Arrow Head	No Name
6 Stack Barrels for Forges	No Name
1 Foot Punch for 22 gauge Metal for Bench	Brown, Boggs Co.
Hand Power Bench Groover, 18 in. with Handle	Brown, Boggs Co.
Small Sand Drum on Heavy Cast Iron Base No. 11671	MacGregor, Gourlay Co., Galt, Ont.
Power Shear & Punch, upright, Solid Frame, 5 in. Throat, 7½ in. x 16 in. Iron Table, Vertical Adjustment, 48 in. x 5 in. Iron Fly Wheel	No Name
Double End Tenoner, 11 ft. Capacity, 7 in. wide Heads, 9 in. Throat, Cut-off Saw Attachments, 6 ft. Chain Carriage and Self-contained Countershaft	J. A. Fay & Egan Co., Cincinnati, Ohio
Direct Current Generator No. 4-30 Form H., 125 Volts, 240 Amps. Capacity, 45 H.P., Compound Wound	Canadian General Elec. Co.
No. 225 Three Drum Sander	J. A. Fay & Egan Co.
12 in. Buzz Planer, 18 x 74 Table, Single Cut	MacGregor Gourlay Co.
No. 5 Blower, Cast Iron Casing	Buffalo Forge Co.
No. 9 Blower, 45 in. Cast Iron Casing	Buffalo Forge Co.
No. 5 Size Blower, Sheet Iron Casing	A. R. Williams Co.
30 in. Post Band Saw	No Name

MACHINERY FOR SALE

Subject to previous sale, we offer a lot of used engines, woodworking machinery, paper mill machinery, etc., as per list below at unusually good values for the prices opposite each item.

MACHINERY and MANUFACTURER		*PRICE F.O.B. Berlin, N.H. Terms : C.O.D.*
Item A	One steam engine, made by B. F. Sturtevant Co., Boston, Mass. Diameter of cylinder 18-inch—16-inch stroke, center crank, left-hand drive. The indicated horse-power is 300 which is obtained under 120 lbs. of steam pressure and 225 revolutions per minute. This Sturtevant will develop the I. H. P. and more, under sufficient pressure, with one-quarter to one-third cut-off. This engine has not been run in three years and is in excellent condition except that a cracked fin strap and boxes must be replaced, which is all that needs to be done.	$450.00
Iten AA	One steam engine, made by B. F. Sturtevant Co., Boston, Mass. Diameter of cylinder 10-inch—12 inch stroke, centre crank. Base 28 inches by 75 inches, space required to set engine up 96 inches by 52 inches. Driving pulley 40-inch diameter, 12-inch face, driving shaft 4 7/16 inches. Speed 250 to 300 revolutions per minute. This engine is in fair condition.	$200.00
Item B	One 12 x 16-inch Jones & Hitchings Engine, including one 3-inch Waters' Governor, left-hand drive, fly-wheel 72 inches across, with a 20-inch face. Develops horse-power of 60 under 110 lbs. pressure and 110 revolutions per minute; also one 6-inch gate valve.	350.00
Item C	Four Dean Exhausters, made by the Dean Steam Pump So., Holyoke, Mass. Shop Nos. 46130, 49812, 43106—plate lost on one. All four have bronze cylinders, which are 24-inch diameter with an 18-inch stroke. The fly-wheel dimensions are 96 inches across with a 20½-inch face.	Each, 250.00
Item G	One S. A. Wood's Double Clapboard Planer, Shop No. 8557, with edge jointer, and two-saw trimmer which trims 4 feet.	95.00
Item J	One Morris Pulley Machine (bores 1 hole only).	200.00
Item K	One Baluster Machine, made by Mattison Machine Works, Beloit, Wis.	350.00
Item M	One Chisel Sash Mortiser, made by L. Moulton Co., Montgomery, Pa.	100.00
Item N	One American Wooden Frame Dado Machine—2 heads and 1 saw for dadoing, made by American W. W. Machine Co.	50.00
Item T	Twenty-six steel rods 19 feet 10½ inches long, 2⅛ inches in diameter, upset and threaded on one end.	Each, 8.00
Item V	Twenty-six steel rods 18 feet 7½ inches long, 2⅛ inches in diameter, upset and threaded on both ends.	Eact, 8.00

(These rods have never been used and are in good condition with exception of being a little rusted.)

This Big Western Shop is 100 Per Cent "OLIVER"

That there are always three or four steel boats in various stages of construction in the Ferguson Steel & Iron Company's big shipyard, at Buffalo, N. Y., indicates the size of the plant and the magnitude of its equipment.

All the patterns required by this enormous concern and a generous share of the carpentry and wood fitting as well, are handled on "Oliver" wood working machinery. "Oliver" Lathes and the "Oliver" Universal Saw Bench are favorites.

The "Oliver" Sander is a two-man machine and the work on which the protograph shows it engaged is typical of the class of service it is most frequently called on to perform—finishing the outer arc of a mooring post core-box on the disc, the inner arc having been finished previously on the vertical spindle on the opposite side of the machine.

Other Oliver Quality Tools—Swing Saws, Saw Fitting Tools, Band Saws, Surfacers, Jointers, Machine Knives, Boring Machines, Mortisers, Tenoners, Shapers, Wood Trimmers, Tool and Knife Grinders, Woodworkers, Vises, Electric Glue Heaters, Grinding Wheel Dressers.

Send for Special Literature on any of these lines.

MONITE WATERPROOF GLUE

An Efemco Product

Easier Rolling---
Smoother Action

You actually sell these facilities with every piece of furniture equipped with Efemco Acme Grip Neck Ball Bearing Casters.

These casters are Efemco products through and through. Of standard quality—the result of 85 years' manufacturing experience.

Heavy loads and severe tilting strains never put Efemco Casters out of commission. And their rugged, flat tops prevent the balls from binding or falling out.

Made in non-plated, brass-plated and nickel-plated. Sizes 3, 4, 5, 6 and 7. With Maple, Lignum Vitae, Steel, Iron and Fibre wheels.

Improved Glue Heater

No heat controllers or other safety guards are necessary with this heater, **because it cannot injure glue.** It's simple, substantially made of copper and costs less than any other.

Let us tell you more about it.

We make any size desired.

Cincinnati Glue Heater Company
Cincinnati, Ohio

"CASCO" Waterproof Glue

Mixed Cold—Used Cold

COST

FOR JOINTING—very much less than the hide glues.

FOR VENEERING—A little more per pound than vegetable, but little, if any, more per GLUE LINE FOOT.

Hundreds of large manufacturers are using "CASCO" to produce the BEST veneered products, at no increase in cost.

The Casein Manufacturing Co.
Manufacturers of Casein Glues for twenty-five years
15 PARK ROW NEW YORK CITY
NOTE. Send for Casco Red Book. It contains much information on glue, veneer and panels.

"The Woodworker's Standard"

Write for Prices

Clean Fast Cutting—extremely flexible—uniformly coated with hard, sharp, pure Garnet—long lived—these are some of the qualities responsible for the pre-eminence of Carborundum Brand Garnet Paper & Cloth Products, stock carried in rolls, strips, belts and sheets. Can supply immediately from our large stocks.

Norman Macdonald

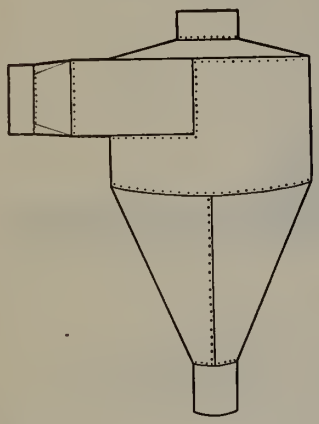
How about your Shaving Sawdust and Dust Collecting System?

Is It Right?

You cannot afford to equip your factory with a refuse collecting system that is always giving you trouble and out of order most of the time. It is a waste of money and a big expense for operating.

You will save money by consulting us. Our systems are scientifically designed and constructed to give continual and satisfactory service.



If your present is giving trouble or if you are contemplating a new one, write us for particulars.

MACHINE MOLDER PRACTICE

THE MOLDERMAN—Because he can find in it the best methods practiced by expert moldermen in plants working all kinds of patterns. Will increase his efficiency.

THE FOREMAN—Who sometimes is called on to operate or set up the molder can get suggestions to cut down his time spent at the machine.

THE SUPERINTENDENT—Being responsible for production, this book will enable him to find out if maximum results are being obtained, that no loss is suffered by poorly maintained equipment or injudicious handling of stock.

THE OWNER—Can get an idea from each chapter and see if applied to his own class of work whether production can be speeded and good lumber saved.

THE MACHINERY SALESMAN—Can get acquainted with the molder in a practical way—know what he is selling and offer helpful suggestions to the trade.

THE APPRENTICE—Can save several years' time required to learn what can be learned from this book in a week.

EVERY WOOD-WORKER—Can become a more all-around man if he knows more about the molder and molder work.

160 PAGES, 100 ILLUSTRATIONS. Flexible Imitation Red Leather Binding, $3.00 Postpaid. Remit by Money Order.

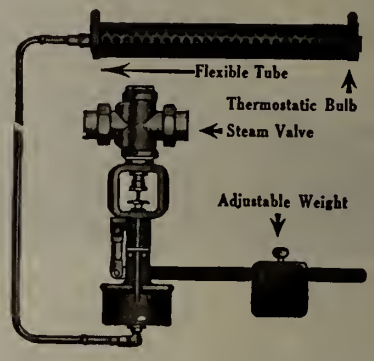
Make Better Use of Your Man-Power

You can relieve the labor situation by using machines on all automatic jobs, thereby releasing men for work machines can't do.

Automatic Temperature Control offers a big field for such labor conservation. Get posted on its possibilities as applied to your particular plant.



The Powers Regulator

No. 15

This is a self-contained regulator requiring no air or water pressure for its operation—adapted to the control of atmospheric temperatures.

Dry Kilns, Drying Rooms, Varnish Rooms, and other similar places offer opportunities for this Regulator to save money, as it is very effective on such operations.

Ask for Bulletin 138. It fully describes this Regulator and its applications.

30 Days' Free Trial

A Powers Regulator will save its cost many times every year, because it never forgets or fails.

Try one on a Glue Kettle, Dry Kiln, Varnish Room, Water Tank, or any other operation where heat is a factor. If it doesn't satisfy you, send it back inside of 30 days and we'll cancel the charge.

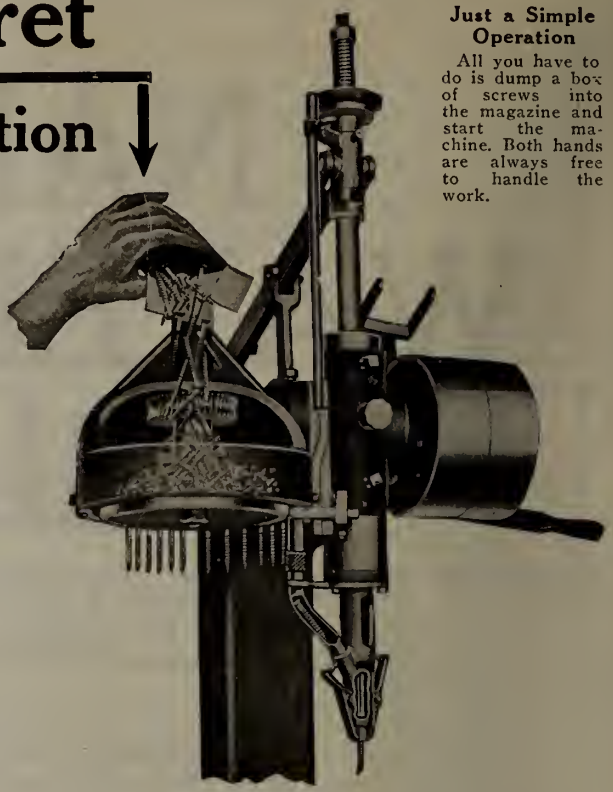
This Is the Secret

of the Automatic Operation ↓

The Magazine Feed of the Reynolds Automatic Screw Driving Machines is an invention that enables any inexperienced man or boy to drive as many as 8000 to 12000 ordinary screws in a day. What a wonderful step it is in advance of the old method.

These machines are made in many different sizes and types to do almost any kind of work where large quantities of screws are to be driven. Tell us what work you are doing, and we will explain the type of machine designed for your requirements.



Just a Simple Operation

All you have to do is dump a box of screws into the magazine and start the machine. Both hands are always free to handle the work.

SIMONDS
CIRCULAR AND BAND
SAWS

In every mill or woodworking shop in the land the demand for greater production is urgent. Devious methods to secure the desired results are being tried out. Some are making good—some are not. They have the man-power, but they can't get production. Many mills and woodworking shops have discovered one of the greatest hindrances to efficient operation are poor saws and knives. The saws dull easily and do not hold their tension, while the knives lose their cutting-edge quickly and this results in unsightly marks on the lumber, and consequently damage.

Inferior saws and knives are being discarded by many, and in most cases Simonds Products are replacing them. There is no question about Simonds Saws and Knives. They are made of the finest steel obtainable, hardened and tempered right and made mechanically perfect. They produce smooth lumber and cut down your operating expense.

Cut Miles without Grinding

A Characteristic Experience

Richmond, Indiana.

G. M. Diehl Machine Works,
Wabash, Ind.

Gentlemen:—

You may possibly be interested in an experience which we had recently in our factory with your Diehl Heads and Cutters.

Our Sticker man recently made a run of 10,000 stiles, each piece being 73 inches long, of hardwood, in which we cut a groove ¼ inch wide by 9/16 inch deep, and we made the entire run without taking the Heads or Bits off the machine and without resharpening, which makes a total run of a little more than 11½ miles. The Bits would, no doubt, have run quite an additional number of feet before it would have been absolutely necessary to sharpen them. We consider this a very good performance, especially in view of the fact that these stiles were all run from the rough wood and the Heads being used on a four-sided Sticker

Very truly yours,

RICHMOND FURNITURE MFG. CO.,

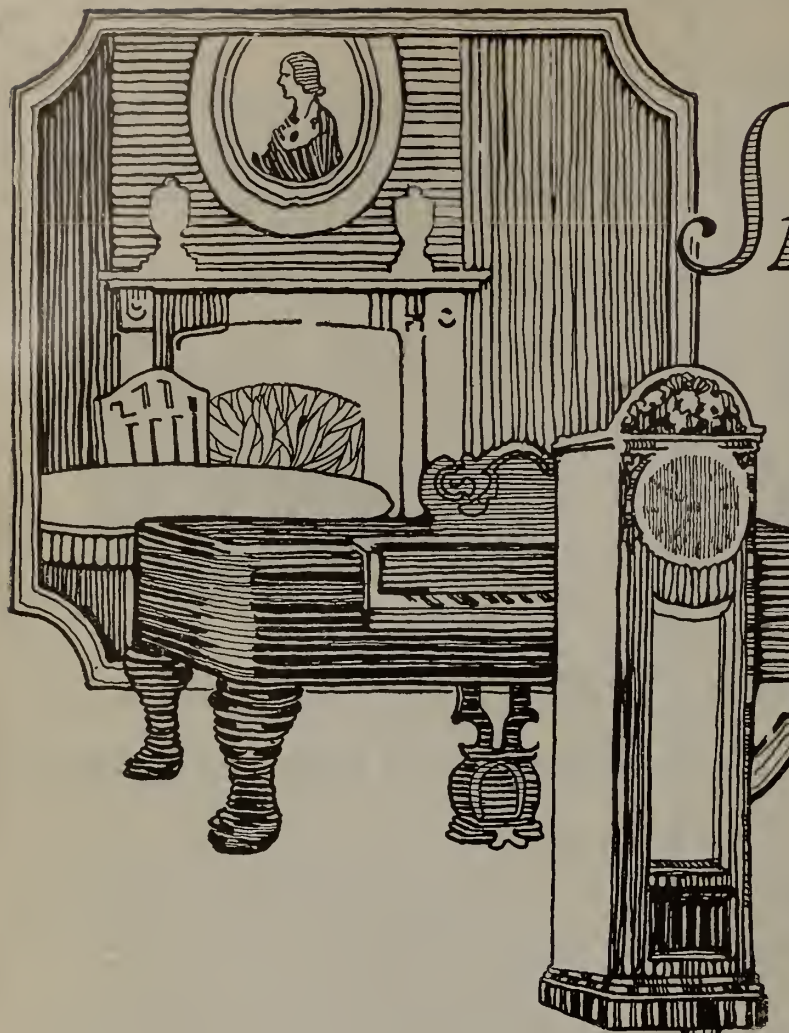
"International Electric Heaters are the best."



Since 1876 the best foundation for Varnish

The use of Wheeler's Wood Filler is not only country wide, it is world wide. It extends to practically every civilized country on the globe.

The reason is not hard to find. It lies in the form of special Silex used as a base. Most fillers are based on such ingredients as Silver White, Gypsum, Corn Starch, etc. All of these are more or less soft and permit of absorption and shrinkage—the two deadliest foes of good wood finishings.

Wheeler's Wood Filler is quite different. It has as a base, rock crystal quartz, which when pulverized is known as "Silex." When the filler is being rubbed in, these tiny, transparent prisms, with needle points so hard that they will cut glass, are forced into the grain of the wood and held there by the special Japan Binder, which is our exclusive product.

Wheeler's Filler stands more reducers than other Fillers; covers more surface per pound and fills the pores flush with a hard, transparent, unshrinkable material that will support the finishing coats without shrinking or pitting.

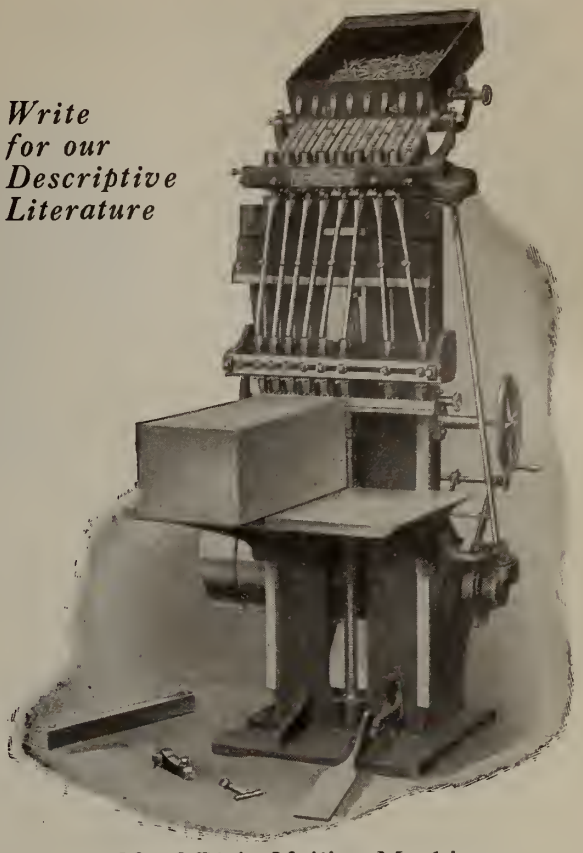
How do YOU Drive Nails?

Write for our Descriptive Literature

The Morgan Automatic Nailing Machine will prove a good investment for any woodworking plant. It drives nails anywhere and in any kind of wood, accurately, effectively and faster than it is possible to do it by hand. It makes money for Box Factories, Canning Factories, Cabinet Factories, Furniture Factories, etc.



No. 8 Plain Nailing Machine

Morgan Machine Co.

DEPT. A ROCHESTER, N.Y.

Increases Service — Reduces Costs

OLSON FRAME EXTENSION

OLSON FRAME EXTENSION -- When you desire to increase the carrying capacity of your Ford Truck, insist on having the Olson Frame Extension.

The perfect balance of the Olson makes the transportation of lumber, furniture etc , a simple matter, even for long distances.

Our nearest branch will be pleased to furnish you with all particulars.

Just a Few Users—

44 Yates No. 275
30 and 60-in. Automatic
Knife Grinders,
Brand New, at
One-half Price

Machines arranged for Motor Application as per cut, or regular belt drive, if wanted.

8 New Andrew Mutiple Vertical Borers, 20, 30, 42 and 60-in., any number of heads.

7 New Hermance Molders, 8, 10 and 12-in., stationary and slip-on heads.

Band rip saw, Fay & Egan, 42-in.
Band saws, 32, 36 and 38-in.
Borer, Andrew, 10-ft., 13-spindle, power table.
Borers, Andrew mult. vert., 20, 42 and 60-in., new.
Carver, 5-spindle, Moore.
Door clamp, Fay-Egan, heavy.
Edgers, two, three and four saws.
Glue cookers and retainers. Glue spreaders.
Hogs, two, Mitts & Merrill.
Jointers, 8, 12, 16, 20, 24 and 30-in.
Knife grinders, two 32-in., F. & E.
Lathe, Ober spoke and handle, almost new.
Lathes, Mattison, No. 8 auto; No. 6 block mach.
Lathes, speed, eight, mounted on iron bed.
Lock-corner machine, Morgan No. 8, full set.
Matcher, American Northwest, 24x8-in., 3 sides.
Matcher, end, Sherman, fine condition.
Matcher, 24x6-in., 3 and 4 sides.
Automobile spoke machines, Defiance, complete set.
Band resaw, 50-in., Fay & Egan, tilting rolls, full set of filing room tools.
Molder, Smith 14-in. outside, latest style, practically new.
Molders, 4-side, 9, 10 and 12-in. American.
Molder, Fay & Egan No. 184, 12-in. outside.
Molders, inside, 13-in. American and Woods.
Mortiser and router, Fay & Egan No. 124.
Mortiser, chain saw, New Britain No. 1, 25 chains.
Mortiser, chain saw, New Britain No. 7, new.
Mortisers, F. & E. vertical, hollow-chisel; also plunger type.
Nailers, two, Morgan No. 8, used three months.
Nailing machines, 2 closed back, 4-track, 4d, 15-in. spread.
Pony planers, 16, 20 and 24-in.
Relisher and mortiser, Greenlee.
Rip saws, self-feed, Hoosier, F. & E., Greenlee.
Router for stair stringers, H. B. Smith, flexible arm with adjustable table and forms.
Sand belt, closet seat and similar work.
Sander, H. B. Smith, spindle and disc, practically new.
Sanders, 30 and 42-in. Columbia; 30, 42 and 48-in. Invincible; 30-in. double Invincible.
Saw, 8-ft. double cut-off, roller table.
Saws, combination and variety, single and double arbor, also tilting arbor, stationary and tilting table, 24 and 30-in. circular resaw.
Saw, circular re-slab, 40-in. blade, power feed rolls.
Shapers, Fay single-spindle reversible, also Shimer single with overhead routing attachment.
Surfacer, 30-in. double, cabinet, B. & M., practically new.
Surfacer, Whitney 30-in. double, sectional roll and sectional chipbreaker; American No. 4½, 36-in. sectional and solid; Fay & Egan No. 140, 27 and 30-in. double divided rolls; also 18, 20, 24 and 30-in. single cylinder panel planers.
Tenoners, B. & M. double-end, also several single-end tenoners with and without copes.
Timber sizer, Fay-Egan s4s, 17x12-in.
Window frame machines, Smith & Phillips combination.
Wood-worker, universal, Fay & Egan and Bentel & Margedant. One lot of glue room machinery.

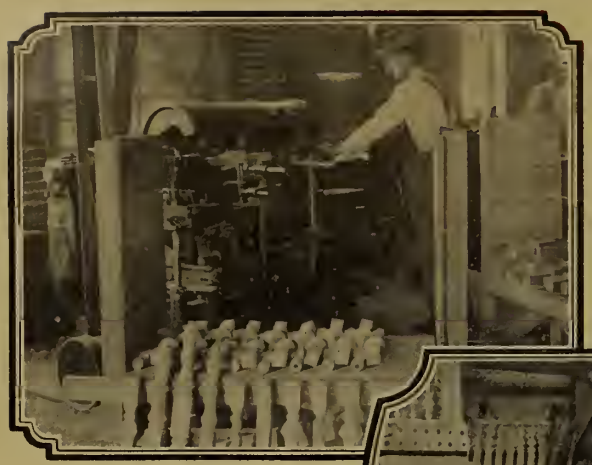
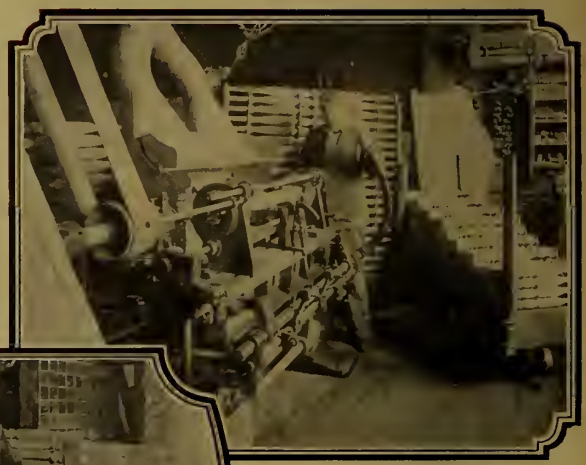
MATTISON
"Automatic"
The Standard Shaping Lathe



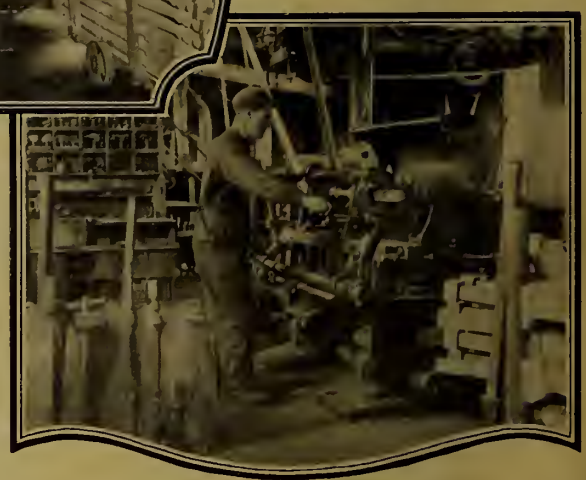
A Practical, Economical Machine Turner



Provides unlimited capacity and minimizes Labor Cost.

Allows the designer free play in the creation of elaborate or complicated patterns.

Efficient and dependable — requires but an ordinary mechanic to operate.



Thru the various stages of its development, the "Mattison" has given profitable service to its users

Conditions faced in 3,000 installations brought problems, the solving of which showed the way to the improvements now designed into the latest model "Mattison."

Model 1-D Portable Drill

HANDY—ECONOMICAL—EFFICIENT

Specifications:

Length—10 inches.

Weight—4¾ pounds.

Capacity—Steel, 0 to 3/16". Wood and alloys, 0 to ½".

Motor—Universal, on either direct or alternating current.

Diameter of Motor—3⅜ inches.

Spindle—Offset from center ⅜".

Helical Gears.

Aluminum Handle.

Complete with 10-ft. cord, plug, switch and chuck.

Jacob's Chucks used as a regular equipment.

FOR speed in drilling and countersinking small holes, this tool is just what you need. It can be used on any kind of material—steel, iron, brass, aluminum or wood—and gives lasting service.

If your dealer cannot supply you with the Model 1-D, tell us about your requirements.

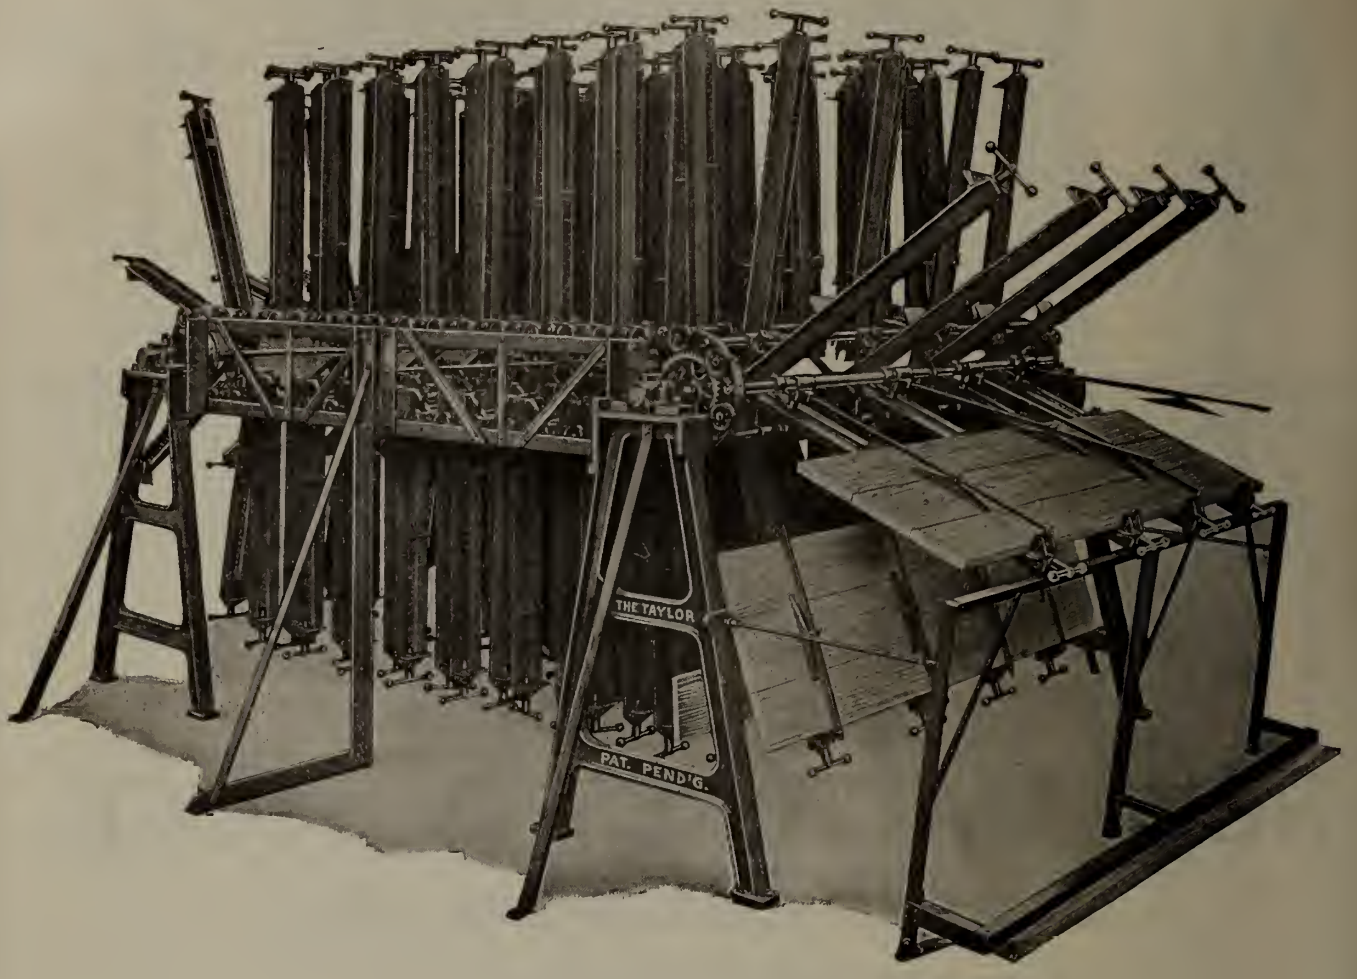
CLAMP The Taylor TRADE MARK CARRIER



Forty section machine carrying 160 clamps, measuring 8 ft. 2½ in. between shaft centers.

The clamp is one of the most interesting features of the clamp carrier. A remarkable strain can be applied with greatest ease; the work it turns out—both thick and thin stock—is 100 per cent. perfect.

An Engineering concern recently wrote:

"I am recommending Taylor clamps to the Germain Mfg. Co. because I have proven the clamps more efficient through scientific time studies on both and all existing types of gluing-up machines and devices."

As a result of the above recommendations, The Germain Mfg. Co. referred to bought two Taylor carriers. They installed them, and tested them and have since purchased two more. We can tell you numerous instances where customers are using from two to nine Taylor carriers each as a result of similar experiences.

Let us prove the truth of these claims by showing you one of these carriers in operation, or you can try the clamps out on your own work. Ask for C. C. Folder and further information.

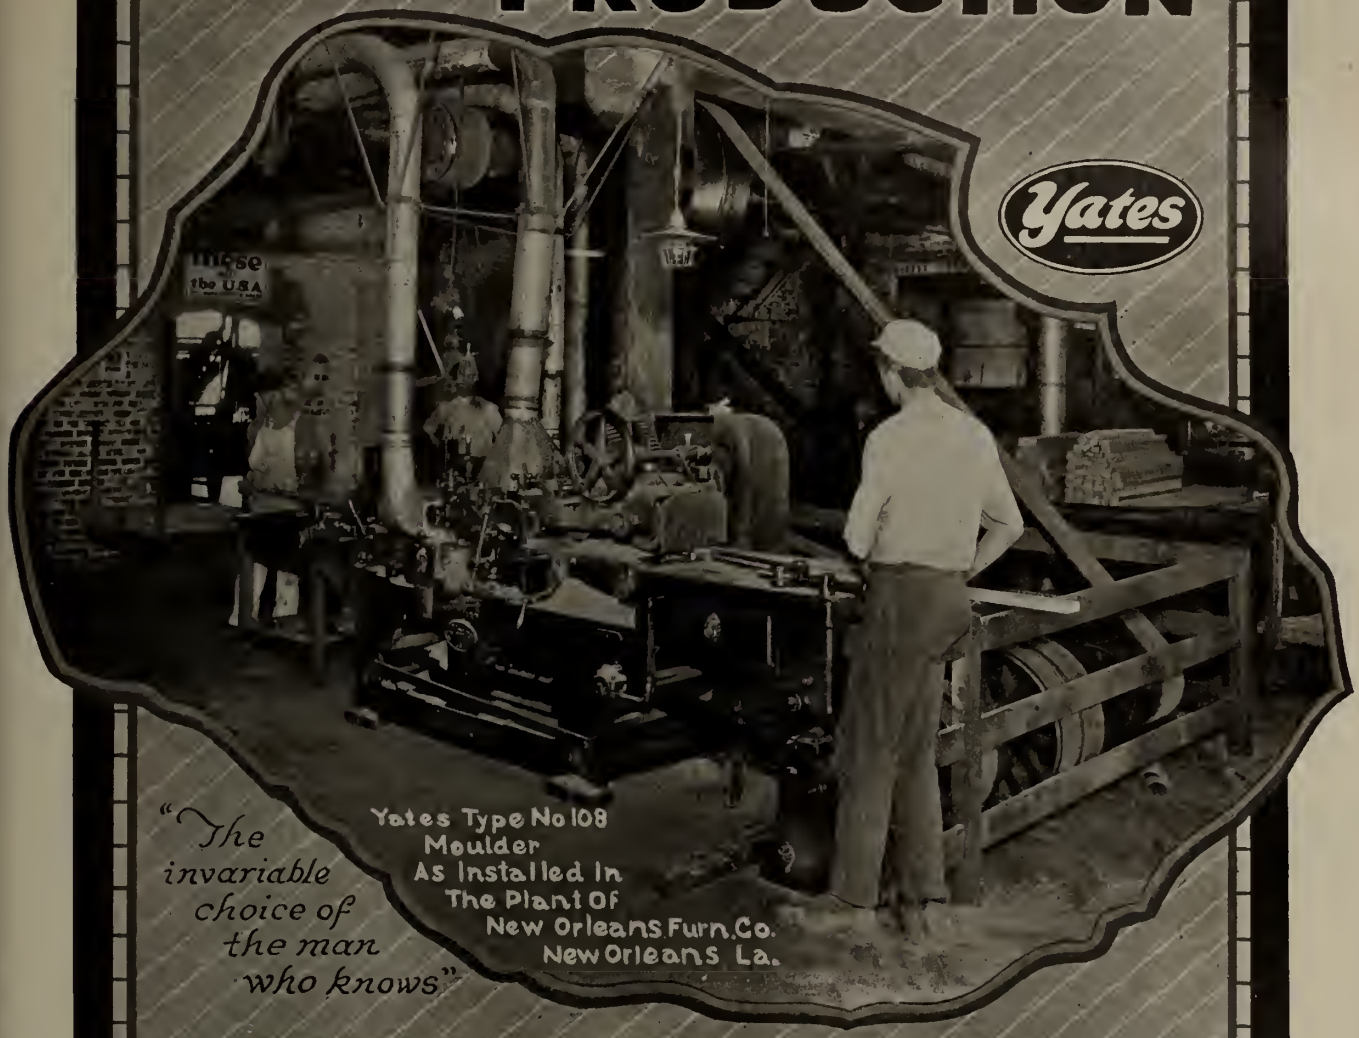
POUGHKEEPSIE, N. Y.

LESS MEN, MORE PRODUCTION



"The invariable choice of the man who knows"

The Yates No. 108 Moulder

is built for strength and speed and it sure does get the work out. Is just the machine progressive mill men are looking for. They cannot afford to be without a No. 108. This is the big reason. By actual tests, in many mills, under all conditions, the Yates No. 108 got out more mouldings and better mouldings with less men. Write a letter for detailed information and circulars.

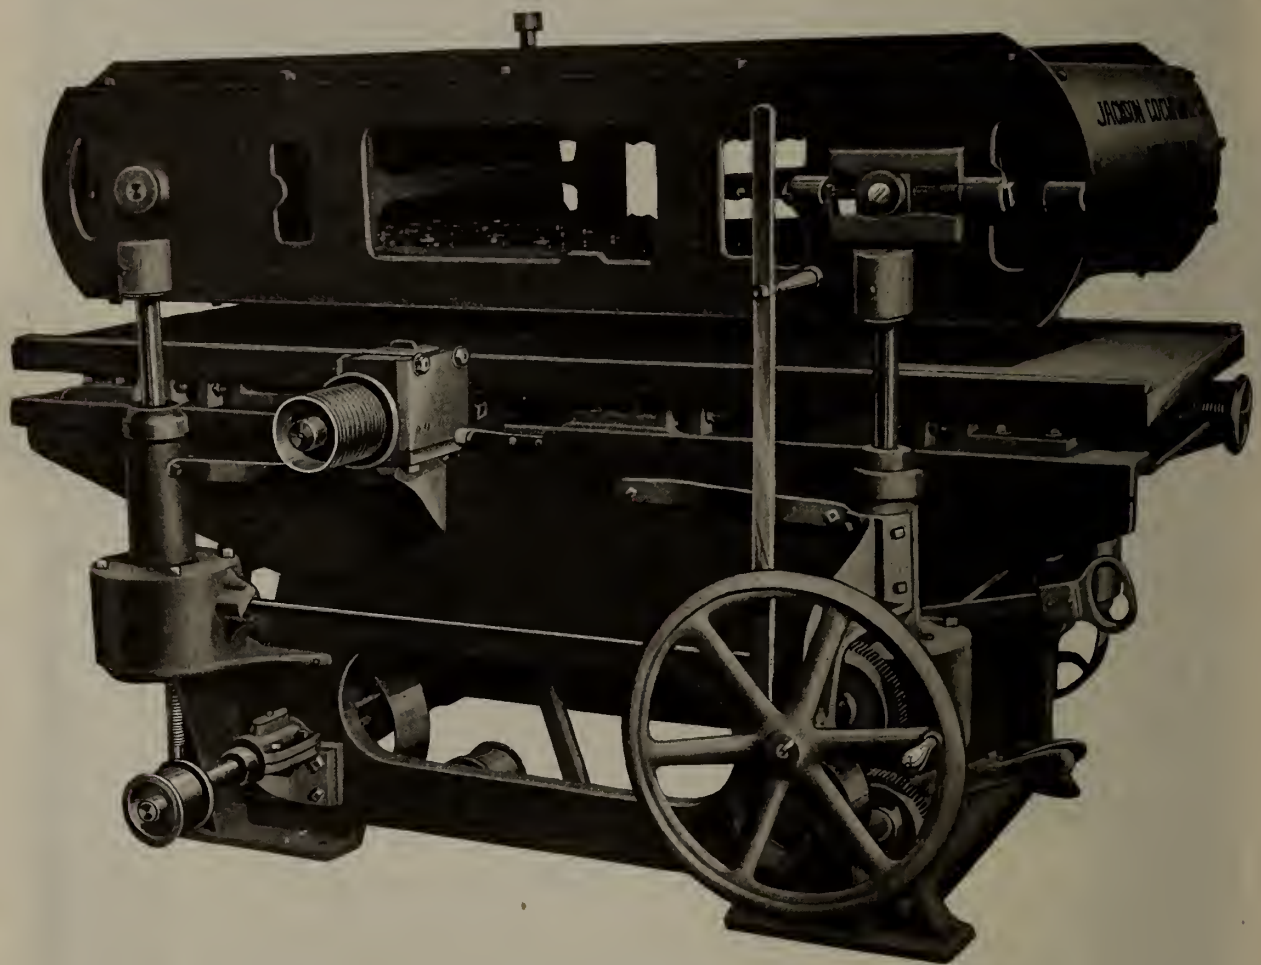
The

Herzog Self-Feed Jointer

means

Increased Production
Small Floors Space
Simplicity of Operation
Safety to Employees

Does Four Times the Work of the Hand Jointer



Our No. 34 Herzog Jointer, illustrated above, is one of the most efficient machines on the market to-day. It is appreciated by the manufacturer and employees alike, because, while it will produce from three to five times as much work as the hand jointer, it does not require skilled operators, but eliminates the danger so common to other makes. It can be operated by two boys. It will handle stock varying in width from 1 inch to the full width of the jointer, will feed fast or slow, takes only one-fourth the floor space of hand jointers, and requires only one-fifth of the sharpening of the knives. It is fitted with power feed raising and lowering attachment, with cylinder double belted and driven from both ends.

If interested in reducing your costs, write us

Jackson, Cochrane & Company

KITCHENER - CANADA

The Shimer Round Safety Cylinder with High Speed Knives

A Round Safety Cylinder that will Appeal to the Buyer and the User for Three Reasons:

The first is our adjusting nut for setting the knives. It is the only cylinder with properly located adjusting nuts for setting the knives, which, with our way, can be set to 1-1000 of an inch.
The second is our way of holding the knife without tapping into the head.
The third is the correct angle of cut for the knives.

Made for Any of the Different Makers' Machines and in Any Length Cylinder.

THE

Money Maker Adjustable Rod

and

Dowel Machine

The machine that is sent under a guarantee to show you a gain of from 100 to 400 per cent. before you buy it.

The improved dowel machine that 90 per cent. of the largest and oldest machinery builders and dealers now endorse and recommend in preference to the solid chuck machines they themselves previously built.

One cutter head turns from 1/4 in. to 2 in. diameter.

Turns hard or soft wood equally well.

Handles heavy, oversized squares.

No choking of the cutter head.

Smooth stock.

Accurate sizes.

Works stock as short as five inches.

Rolls automatically centre variations in squares.

Machines built to turn from 1/8 to 6 in.

We want to hear from every user of a solid chuck dowel machine.

We can save you from one dollar out of every two, to four out of every five, that the operation of solid chuck machines costs you.

Engagements for competitive test solicited.

Formal orders not solicited. All sales made after demonstration.

The only question is, are you willing to cut cost of your dowel turning to one-half or one-third of what it costs with any make of solid chuck machine?

Machine delivers the goods before you buy.

State conditions of stock closely.

Special conditions require special equipment.

THE

Quicksharp Grinder

Wherever this machine has been installed it has been found to live up to the claims made for it. The ease of attaching and detaching, the speed with which it will grind a set of knives without removing them from the machine, the perfect work it performs and the time it saves make the Quicksharp Grinder an indispensible machine in every woodworking shop.

It has many unique and highly commendable features—in fact will do all and more than the expensive automatic, yet it is reasonable in its first cost and operates from a lamp socket.

It wouldn't take it long to pay for itself right in your own factory, and if you are dissatisfied with your present grinding equipment you should investigate it. We will gladly send full particulars.

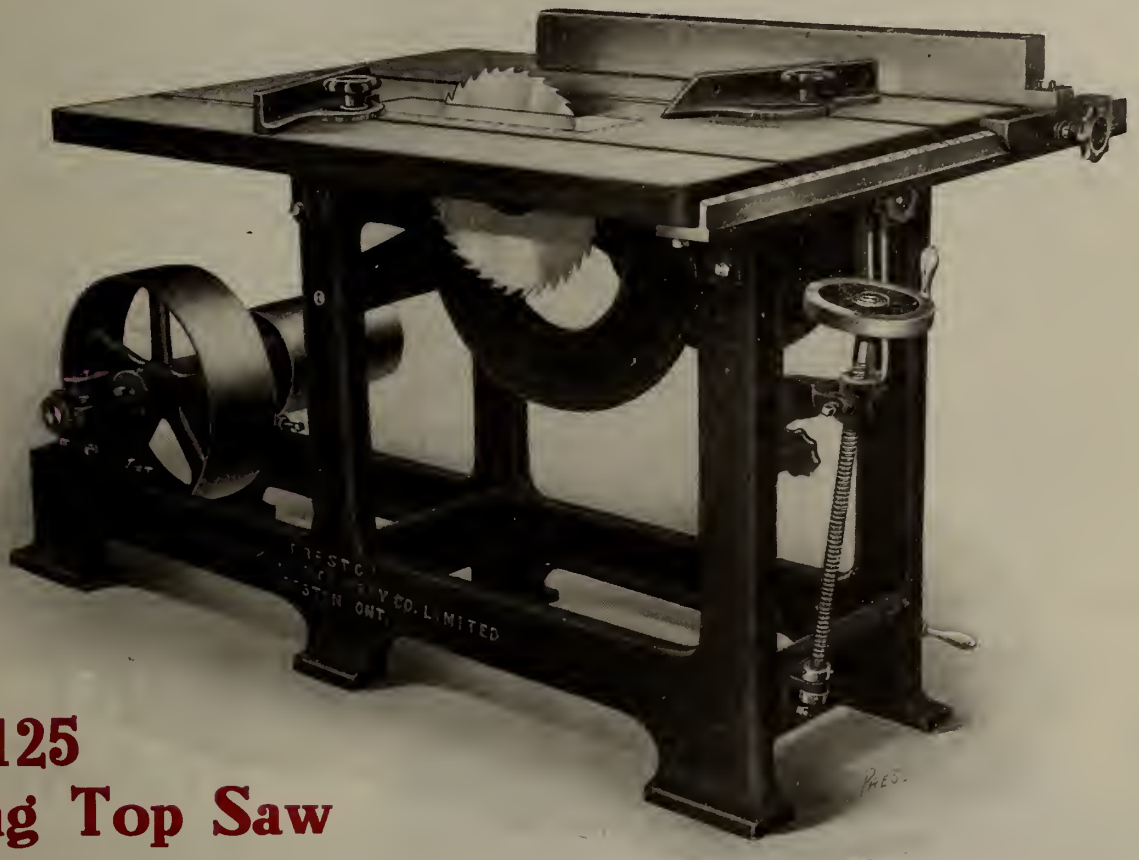
Preston Woodworking

PRESTON

You can always depend upon a "PRESTON" for quality



No. 125 Tilting Top Saw Table

A medium sized machine, well adapted for the Furniture Factory, the Sash and Door Factory, the Cabinet, Pattern and General Woodworking Shop. It is designed to give the greatest amount of efficiency and to take up as little space as possible.

The one piece cast frame makes it a substantial, rigid machine, and the easy and rapid adjustment of the saw makes it a simple matter to change from one operation to another.

For dadoing, grooving, bevelling, mitring and rabetting it cannot be beaten. You'll be interested in a complete description of this machine. Send for it.

Power is expensive—SAVE IT

—but not by reducing production.

In fact, by the use of ball bearings, you can largely increase production and consume no more power than formerly, for in the average plant friction destroys at least 25 per cent. of all the power produced or bought.

High grade ball bearings, such as S K F and Hess-Bright are almost frictionless. Not only is less power required, but belting life is lengthened, wear is practically eliminated, bearing renewals are postponed almost indefinitely, frequent tying up of equipment is avoided, oil costs are lower, and hot boxes are unknown.

Ball bearings, by conserving the energy formerly wasted, benefit the whole power line from the machines back to the boilers.

CANADIAN SKF COMPANY, LIMITED

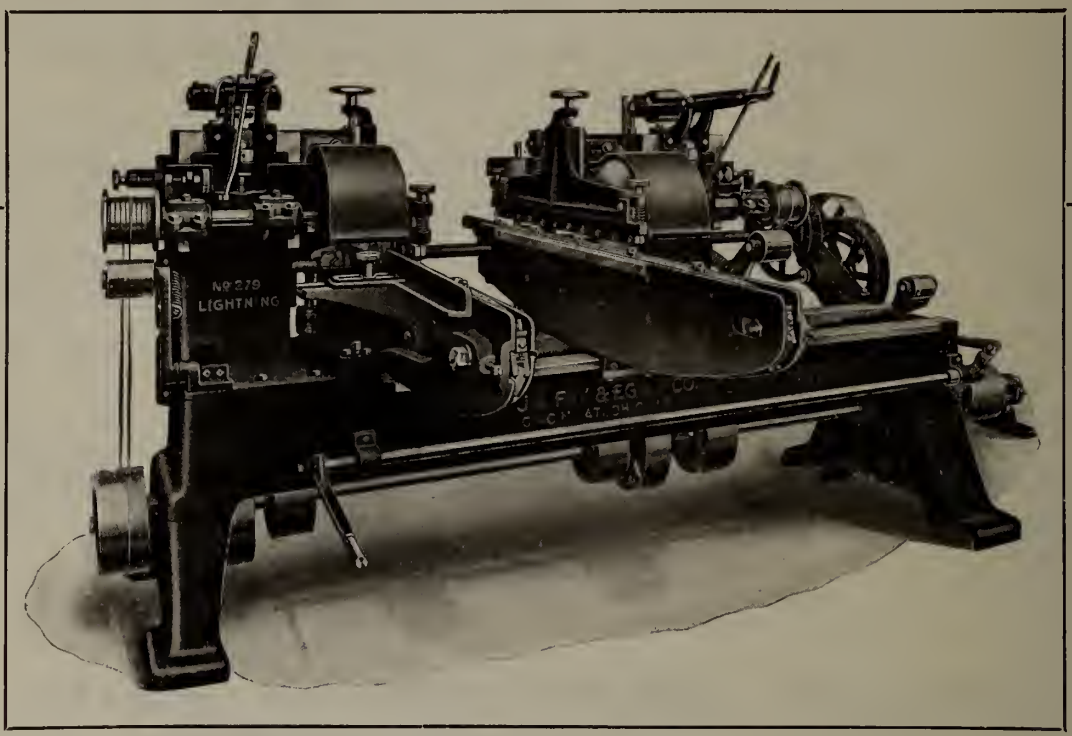
Control Your Manufacturing Costs

by installing a

No. 279 "Lightning" Double End Tenoner



There are many jobs now being worked on Shapers, Gainers, Saws, etc., which could be done better and more cheaply on a No. 279.

No. 279 was designed for cutting tenons, coping and cutting off to exact dimensions both ends of material at one operation.

This machine is not only a modern fast-feed Tenoner—it is an up-to-date Automatic Double Cut-Off and Equalizing Saw as well.

As a Tenoner, it is distinctive in that it is entirely self-contained, all operating parts being driven from a single countershaft in base of the machine, greatly economizing floor space.

Send for Special Bulletin I-16 for full information about this wonderful and labor-saving machine.

MAGIC
VENEER TAPE

is made of highest quality Kraft Paper that peels off your veneer in one piece, thus eliminating that tedious and expensive work of sanding or scraping.

YOUR especial needs of Veneer Tapes, whether Paper or Cloth, can be furnished by

The Gummed Products Co.

Troy - Ohio

Chicago Minneapolis New York

There's no use arguing

Veneer Tapes may all look alike to the man in the office, but the shop foreman knows how they differ. When he points out the advertisement to you in the Woodworker, be sure to order the genuine

Nashua Veneer Tapes (Made in Canada)

Write for samples and prices.

Whether you require Kraft, Hollands or Coarse Cloth, Nashua Quality tapes will fill the bill.

You will swear by them—and not at them.

OUR MOTTO

REASONABLE PRICES - that you can afford to pay.
EFFICIENT SERVICE — that you have a right to expect
FAIR TREATMENT — that you can depend on getting

We would appreciate an opportunity of furnishing a portion of your lumber requirements.

"Hartzell's Choice Walnut"

Are you a believer in the fact that

"Quality Counts"

Have you ever experienced that delightful sensation of accidently overhearing a person speaking in a complimentary way of the "Quality of your Product."

"We emphasize Quality"

If your finished product is made from Hartzell's American Walnut Lumber and Veneers you will have the last word in "Quality"

There is a difference and it will pay you to think it over.

Samples submitted and quotations made upon application.

Our Motto is
"Satisfied Customers."

Geo. W. Hartzell - Piqua, Ohio

The Hotel Pennsylvania Used Walnut

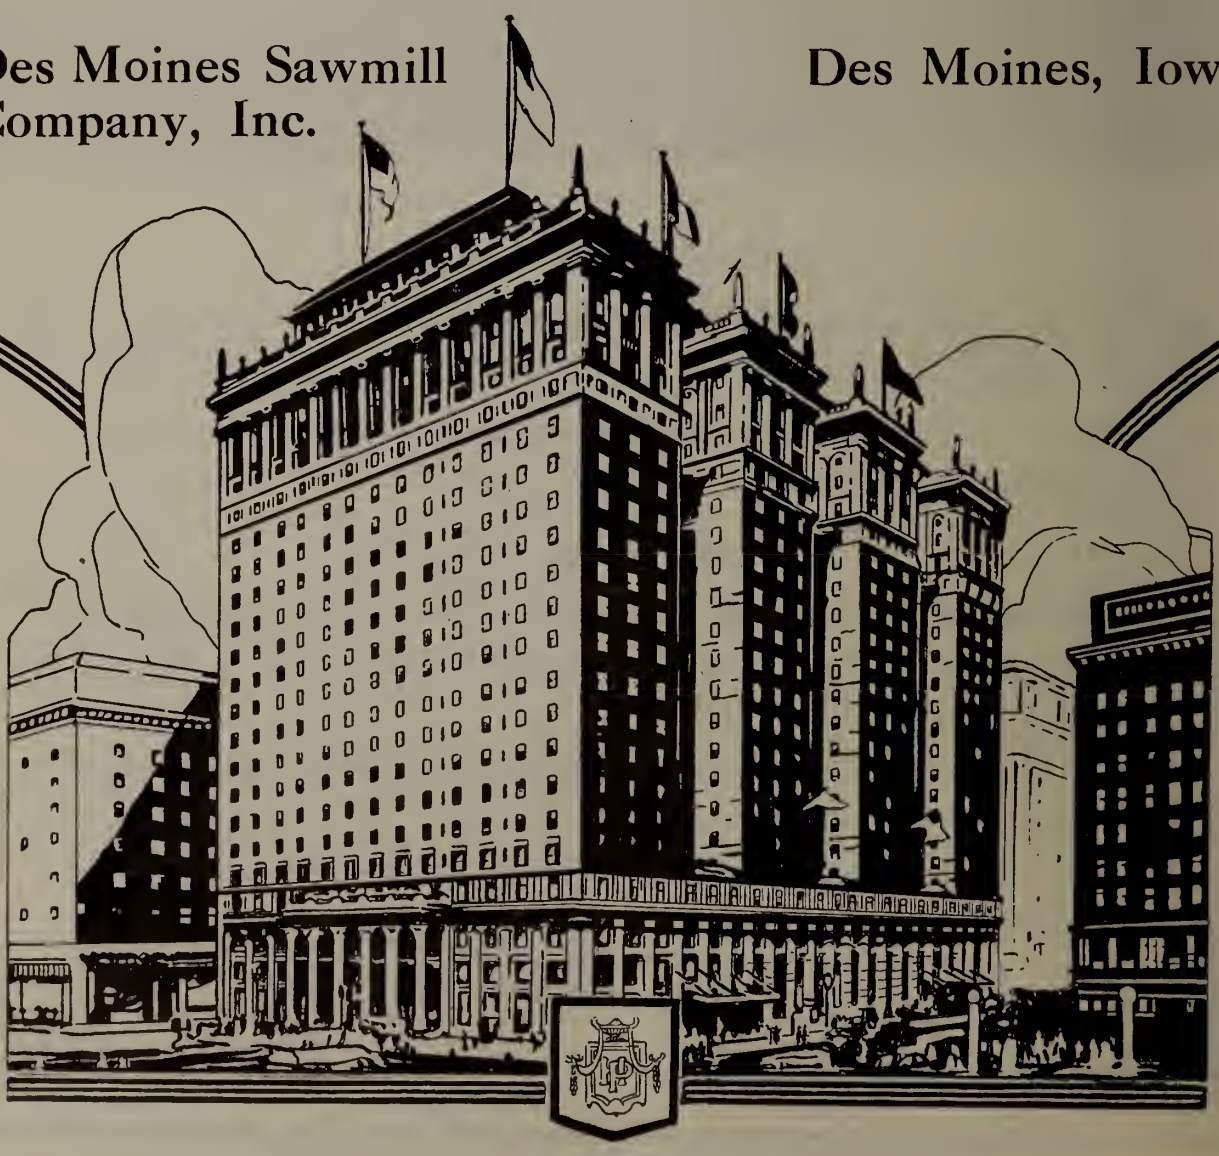
They selected American Walnut because they believed it to be the most practical and yet the most distinctive wood obtainable. Later they confirmed their own judgment by consulting the preferences of the public they serve. The management in a recent statement say:—

> "The fact that we have chosen Walnut as a furniture wood and for the interior trim for the largest hotel in the world, and a hotel which is designed for New York's most discriminating hotel patrons, speaks for itself. Could we say more?"

Use Walnut for all furniture and interior trim and especially insist upon the Iowa variety in both lumber and veneers.

Des Moines Sawmill Company, Inc.

Des Moines, Iowa



GLIMPSE NO. 2 INTO THE SPIRIT OF AMERICA'S SECOND GREATEST INDUSTRY

Pride in *First Class Work* is the Label of Leadership

Nowhere else in the world does the science of *Lumbering* equal modern American methods. And no *hardwoods* in the world surpass the superb cabinet-woods of our own great eastern and mid-southern forests. (Knowledge of their extent today gives a sudden joy to people of cultured taste in *furniture* and *interior-trim*, some of whom had almost been led to actually believe in the early exhaustion of our native supply! Yet generations to come will share our present lavish privileges.)

The vista shown above is *two miles long*—a solid bed of *superior hardwood logs*, of *many species*, which in due course will yield over 12,000,000 board-feet of the best furniture, trim and specialty woods in the world today.

Notice the obscure *temporary railroad* at the right—laid (at heavy cost) to convey the thousands upon thousands of selected logs from their neatly arranged "stop-over" to the great mills which are to convert them into form for your most intimate and life-long uses.

It is a fascinating thought—as to *just which* of the logs seen above may contain the material for *your own new dining room set*, your new *phonograph cabinet* or the *interior trim* (or floors) of your *new home*—perchance this year, or next year (or even the year after.)

No matter when it happens, however, *you never will forget this photograph* of the superb logs, superbly "logged" and so proudly and skilfully handled, parts of which *some day or other* are to be *your very own.* (Really, the notion is distinctly interesting!—Isn't it?)

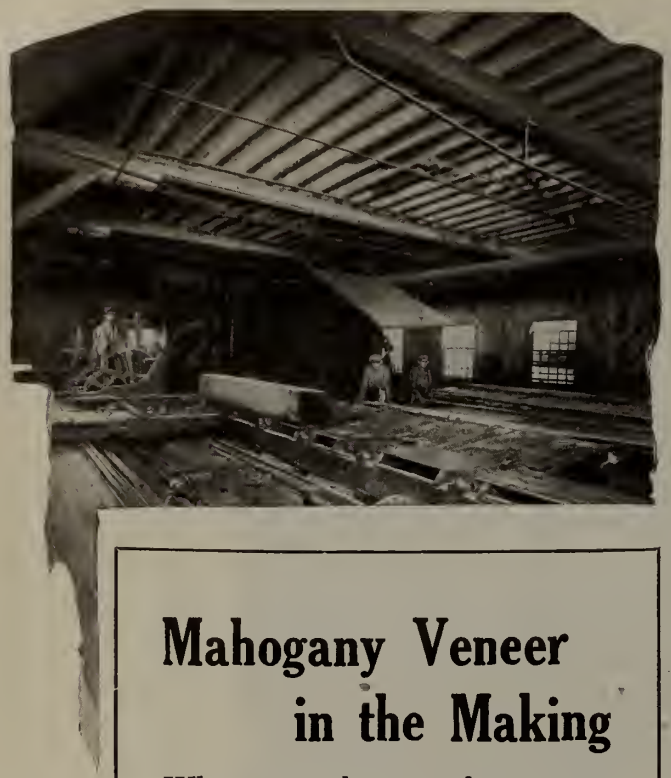
ASTORIA MAHOGANY
LUMBER & VENEERS



Mahogany Veneer in the Making

When a mahogany log comes up to the standard set by our veneer experts, it is "quartered" in the manner which will ensure the full beauty of figure. Then away it goes on roller conveyors to the steam vats for softening, preparatory to being sliced into veneer.

The perfect co-ordination of man and machine has contributed greatly in making this the largest mahogany lumber and veneer mill on the Atlantic and Gulf Seaboard.

Wake-up, Mr. Furniture Man!
Walnut is Plentiful!

AMERICAN WALNUT

"The Cabinet-wood Superlative"

Corners That Stay Square

Chests and cabinets, tables and chairs—how satisfying it is to have their corners stay tight and square, their drawers continue to slide smoothly, their legs remain true and firm through the years.

The corners and drawers and legs of WALNUT furniture have been doing these satisfying things for centuries.

Our museums show multitudes of beautiful examples which have really improved with age. (The Walnut Brochure de luxe shows engravings of many of these. *May we send it?*)

The cabinet maker worthy of the name cannot help but love AMERICAN WALNUT, that superlative cabinet-wood which has almost been the parent of his art and craftsmanship.

So it is your good fortune that there is made every day in America *FURNITURE* of AMERICAN WALNUT which will carry the lesson of your discriminating taste "even unto the third and fourth generation."

You are not forgetting that you want the pleasing Walnut Brochure? Are you? Just drop a line. (*Now* is the best.)

AMERICAN WALNUT
MANUFACTURERS' ASSOCIATION

Room 1019, 616 S. Michigan Blvd., Chicago

ALL BRANCHES OF THE FURNITURE TRADE

are feeling strongly the Effects of the series of tributes to our American Walnut which are running continuously in most of the Best Publications in America. Above is an example.

There are still a few Furniture Houses in the Country

who are giving some of their better-posted competitors a great advantage over them with the Best Trade. WHY? Simply because they "heard somebody say" that American Walnut was getting scarce. Let them ask us for THE FACTS! (See address above.)

Hardwood Lumber

Thirteen Band Mills
Six Planing Mills
Eleven Flooring Units
} ***Annual Capacity, 130,000,000 Feet***

It is an expensive process to convert the standing trees into lumber and deliver it to our patrons in the sizes, grades, and kinds adapted to their every need.

Not only does it cost enormous sums to buy the timber and to build mills to manufacture it into lumber but there are costs and items of expense of which the average consumer has probably never thought.

The trees must be felled in the woods and cut into logs; this requires annually 800 axes and 1000 crosscut saws.

The logs must be snaked down the mountain sides to points accessible to the skidders and loaders. This requires 270 horses.

They must be skidded and loaded and the upkeep of machines for these purposes is enormous.

They must be hauled in to the pond at the mill; this requires 350 miles of logging railroad, many locomotives and innumerable logging cars.

These costs,—to say nothing of wages,—in a short time run into millions; yet we must make the expenditures, for not otherwise can we render our patrons

AN UNMATCHED SERVICE

in supplying their needs for more than 150 varieties of lumber and kinds of stock,—the products of our unexcelled hardwood forests.

GOODYEAR

MADE IN CANADA

For Outside Drives— KLINGTITE—An All-Weather Belt

The service given on outside drives by Goodyear Klingtite Belting (formerly Extra Power) is unusual enough to be of interest to every belt user.

Not because there are a great number of outside drives—but because the outside drive is just about the ultimate test of a belt's ability.

The specially designed fabric of Goodyear Belting gives it the strength to withstand brutal outside service.

But the best of cotton will rot and whip to pieces outdoors if not protected.

So we have forced generous quantities of high-grade rubber through and through the plies of Goodyear Klingtite Belting, forming one solid unit, proof against weather and ply separation, yet flexible, pulley-hugging, efficient.

The special friction surface on Goodyear Klingtite Belts (formerly Extra Power) grips through dust or moisture and prevents slipping.

How well these belts serve is evidenced by this letter from the Beaver River Lumber Co. regarding their Extra Power Belt (now Klingtite). At last report (June, 1920) **this belt was still in service after 32 months' use,** when this mill was burned recently.

In their letter the Beaver River Lumber Co. say: "The belt driving the conveyor runs direct from a small engine to the conveyor drive. It is subject to steam and heat in the engine room and to cold and dampness on the outside. Under these conditions, there is no sign of deterioration and there is no slippage."

The same testimony is advanced by hundreds of farmers and threshermen who bought Goodyear Klingtite Belts (under their old name of Extra Power) for severe outside service on the farm.

If you have an outside drive, by all means investigate Goodyear Klingtite Belts. If you have **any** transmission drive, let a Goodyear Belting man show you how Goodyear Belts, which are good enough for outside service, will render heaping value on inside work. Phone, wire or write the nearest Goodyear Branch and a man will call without obligation to you.

The Goodyear Tire & Rubber Co. of Canada, Limited

Halifax, St. John, Quebec, Montreal, Ottawa, Toronto, Hamilton, London, Winnipeg, Saskatoon, Regina, Calgary, Edmonton, Vancouver.

KLINGTITE BELT

Improved Glue Heater

No heat controllers or other safety guards are necessary with this heater, **because it cannot injure glue.** It's simple, substantially made of copper and costs less than any other.

Let us tell you more about it.

We make any size desired.

Cincinnati Glue Heater Company
Cincinnati, Ohio

"CASCO" Waterproof Glue

Mixed Cold—Used Cold

COST

FOR JOINTING—very much less than the hide glues.

FOR VENEERING—A little more per pound than vegetable, but little, if any, more per GLUE LINE FOOT.

Hundreds of large manufacturers are using "CASCO" to produce the BEST veneered products, at no increase in cost.

The Casein Manufacturing Co.
Manufacturers of Casein Glues for twenty-five years

NOTE. Send for Casco Red Book. It contains much information on glue, veneer and panels.

"The Woodworker's Standard"

Write for Prices

Clean Fast Cutting—extremely flexible—uniformly coated with hard, sharp, pure Garnet—long lived—these are some of the qualities responsible for the pre-eminence of Carborundum Brand Garnet Paper & Cloth Products, stock carried in rolls, strips, belts and sheets. Can supply immediately from our large stocks.

Norman Macdonald
62 and 64 Temperance Street
TORONTO - - ONTARIO

Carborundum Brand Garnet Products Make Good with the Men

"It's up to the men and they seem to want Carborundum Brand Garnet Products. If we give them something that doesn't do the best work we soon hear of it."

So says the general manager of a live, busy Western New York furniture plant.

His men think pretty well of Carborundum Brand Garnet Paper and Cloth.

For instance, G. D. Danielson, foreman, says of that flexible belt he is using for sanding gumwood table supports—

"Mighty good stuff. Will by far outlast and cut a whole lot more than any cloth I ever used."

You get the same story all through the plant. The men appreciate what it means to work with such uniformly clean, quick-cutting, long-lived paper and cloth. So will the men in your plant.

Vol. 20 Toronto, September, 1920 No. 9

Fire Prevention Week

All woodworkers, both owners and workers, should take an active interest in "Fire Prevention and Clean-up Week," October 9th to 16th. The manufacture of wood products, owing to the inflammable nature of the raw material used, is beset with many hazards. The yearly toll taken from this industry by the destroying fiend reaches appalling proportions.

A large part of this loss is preventable. A few simple, common-sense precautions, on the part of employer and employee, would result in a worth-while reduction in the number of fires. Just think that in Ontario alone over thirty-two thousand dollars worth of valuable property goes up in flames each day. It is nothing short of a crime that this should continue when the exercise of a little care and the ordinary rules of cleanliness would check this daily reduction of our national wealth.

The owner of a plant is inclined to rest content when he has installed certain fire protection and prevention appliances and when he has a number of insurance policies stowed carefully in his safe. That is not sufficient. All such equipment should be checked regularly to make sure that it is in working order and every precaution taken to eliminate all fire hazards and danger spots. Insurance money may help replace a plant, but it will not make up for lost business and profits or help to retain customers.

As a workman in the plant you may not realize that you are vitally interested in fire protection for not having an interest in the plant you have nothing at stake. Just stop a moment. Is not your job at stake? Is that not worth trying to save ? If the plant which gives you employment were to go up in flames to-day, where would you look for employment? It is your problem as well as that of the owner or manager.

Fire prevention week is a move in the right direction, so let us boost it. Let us go a step further and make the next twelve months a fire prevention year. The effort required is not onerous, while the object aimed at, elimination of fires, is one that touches the pocket book of each individual in Canada.

Standardization of Millwork

In his article on knock down trim for residential work, which appears in this issue, W. H. Shaw touches on a question that is engaging the attention of progressive millmen on both sides of the international boundary. Standardization of millwork such as doors and door frames, window sash and frames, mouldings and other forms of detail work has been a topic for lively discussion at different gatherings held in recent months. Little real progress may have been made, yet the fact that such a subject is considered of sufficient importance to be discussed at association meetings, indicates that many woodworkers realize the value of such a step.

Someone may suggest that as far as mouldings go, there are a number of designs which are followed by the majority of millmen and which might be called standard designs. That may be so, but an examination of these same mouldings, made at different plants, would quickly convince one that they are far from being uniform. If samples of a 3½ inch "ogee" moulding were to be gathered from twelve different factories it is extremely unlikely that two out of the twelve would agree in size and contour. This is not standardization.

The development of special heads, with solid, milled cutters, for moulders and stickers has paved the way for standardized mouldings. With these milled cutters a woodworker can reproduce a design, without the slightest variation, as often as he wishes. Another woodworker operating a plant in a different part of the country could by using similar cutters make an exact duplicate of that moulding. One that would conform in every detail. The manufacturer of the cutters would work to templates to ensure absolute uniformity in every cutter sent out.

Another suggestion that would assist in standardization would be the working out and general adoption of a set of standard gauges and templates for checking the sizes and shapes of the different mouldings. Using standard gauges and milled cutters should result in uniform product.

In the article mentioned the author suggested standard-sized openings for doors and windows. This would enable a millman to cut the trim and heads for the frames and by making up large lots take advantage of quantity production. This is an application of the ready-cut house principle in a small way. Certain economies in stock and methods would be effected that would lower manufacturing costs and tend for a cheaper product. The opinions of a number of woodworkers on this subject would be welcomed.

Economy and Use of Knocked-Down Trim

Standardization of Patterns and Sizes as a Means to Increased Production and Lower Manufacturing Costs—Stock Cut to Size at Plant—Service That Will Increase Business and Profits

By W. H. Shaw

One of the subjects, which this coming year will receive special attention by builders and supply men is "The Small House." The large house is quite out of fashion. Yet the problem in the small house "Most house for the least money" doubles because in it must be embodied all the conveniences and practically all the accommodation found in the larger dwelling with the newer ideas in sanitation and conservation as well.

What was yesterday a luxury expected only by the people of wealth, has become today a necessity demanded by every working man for his family. Money making is now generally ascribed to the Canadian people as the great motive of existence. Yet there is no people to whom a dollar once possessed, has less value of itself. It is not money ,but what money will buy for which this struggle is made. We are not a miserly or even a saving people. The comforts and the luxuries of living loom so large in the public eye that no effort is too great, no endeavor too strenuous for their attainment. Possibly the spirit of competition is at the heart of the matter. "Own your home" is probably not so much that the people require these things for themselves as they are not willing that their neighbors and friends shall seem to have more, when they themselves are at the mercy of the landlord.

Smaller Dwellings the Rule

In no other line is this so apparent, with the possible exception of the automobile, as in living accommodations. The big handsome "home" has been sacrificed, even by people of wealth, to the more accommodating small house. There has been a shrinkage in the cubic contents of the family house, with a distinct sense of relief both to the man of the house, and its mistress, overworked with the care of help and a large house.

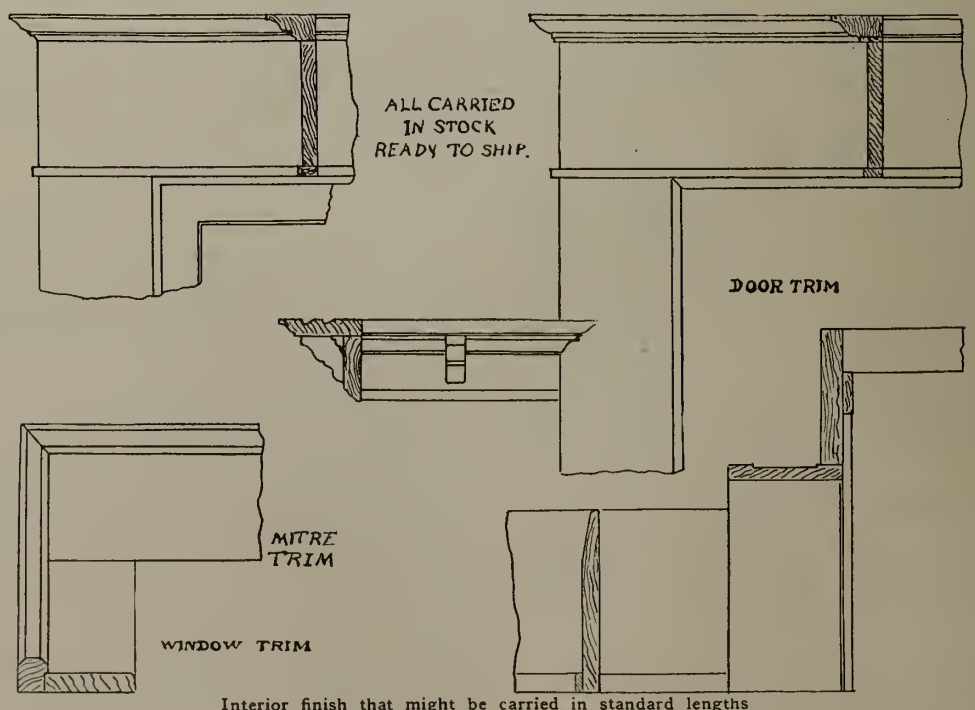
There is much building all over the country which is only waiting the final word of the owner, the capitalist and the speculator, to keep in motion all of the busy wheels of the building industry. The people must be fed, on charity if their normal work is not forthcoming. Capital has no right to retire into safety and shut off the supply of honest homes needed everywhere.

When a railway magnate propounded as his motto "Let the public be pleased" he marked the turn of the tide. The public are pleased with the "Own your own home" idea. A house is a place where we eat and sleep; a home is the place where we really live and enjoy living. That expresses the difference between the house rented and the home owned, and supplies the reason why Canada is fast becoming a nation of home owners.

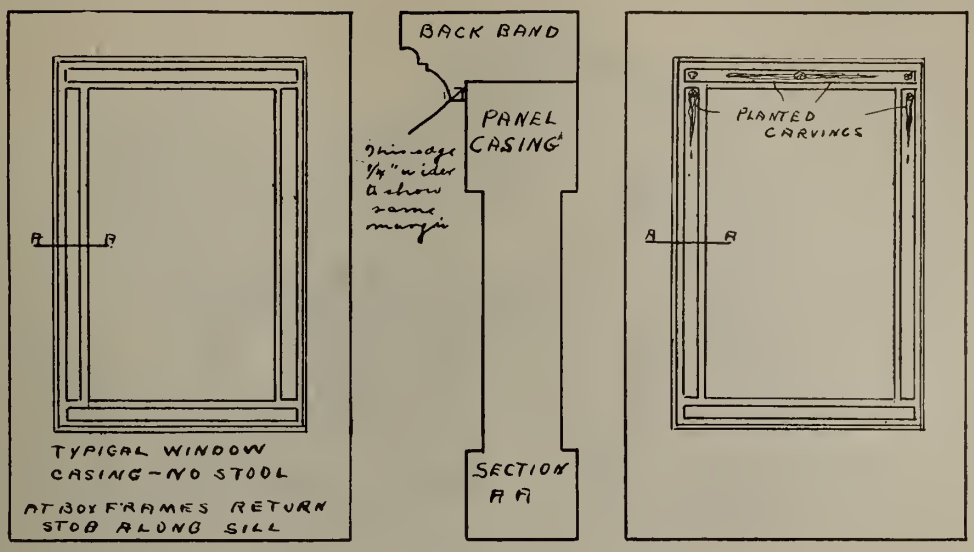
Co-operation Better Than Competition

The economic theory that competition is the life of trade is passing. The thought which has been creeping into the lives of men everywhere, that co-operation is better than competition, is not altogether altruistic. With it is the thought that in giving much we will also receive much. It comes as almost a sense of shock that business may accept the Bible mandate. Yet a big business is freely giving what has not been demanded of it and finds economic returns.

How can the millman and builder, one operating



Interior finish that might be carried in standard lengths



New design in paneled trim proving very popular

his own machinery, co-operate in this demand for homes? By economy in standardization. For instance, there are certain standard lengths, widths and thicknesses of lumber, and certain standard styles and sizes of windows, doors, window frames, door frames, in fact of every kind of millwork. Standard items can be manufactured in tremendous quantities at very low cost while special styles and sizes require readjustment of machinery and entail a waste (sometimes 33 and 1/3 per cent.) of standard sized material to meet special requirements. An appearance as artistic as one may wish can easily be produced without resorting to the expense of special materials.

Economy of Standard Designs

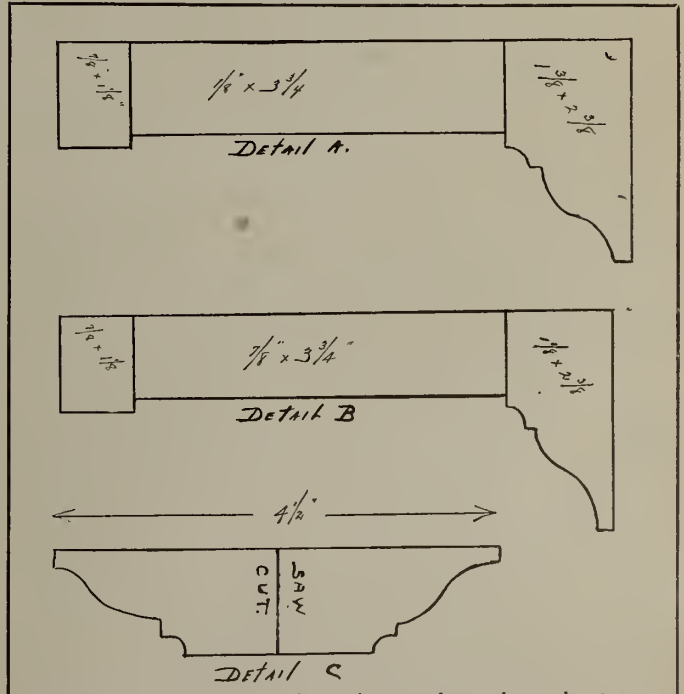
Co-operation today in one sense is "How to avoid all the usual delays, waste, disappointments. What will cut the cost of building a home. Science says, simplicity—standardize—eliminate waste.

This is the day of brain that plans for thousands at a time instead of one. Why is it necessary to manufacture individual trim for every house that is built. There is a wiser, more economical way, decide in a design, try it out and if proven true, use it many times over. Let hundreds of people reap the benefit of your design. And as this is the age of machinery, the day of producing in quantities, produce in minutes, what would take hours by hand labor.

In the matter of interior trim, would it not be better both from an economical and profitable standpoint for millmen to consider putting this on the market in an assembled form? Economy in the last few years has reduced door sizes to 2-2 x 6-6, 2-4 x 6-6 and 2-6 x 6-6 and corresponding in width in 6-8 height. If window sizes were similarily made to standard sizes, why not quote a customer on so many sides of window trim complete, so many inside jambs, with trim two sides complete? If this was carried out would the average millman have as many rippings along side his saw, or as much moulding consisting of a few feet of different designs, to be entered in his stock cards as of no value? Besides these cuttings and ends, by going into full stock for each individual job, would be producing dollars and cents instead of finding their way to the fire hole.

True we have practically only two kinds of trim to choose from—mantle head, and mitred trim, or what has become popular of late a combination of both, a square cut casing for sides and heads and mitred back board.

The mantle trim, as a stock proposition is the most acceptable, although from a material cost is slightly higher. It also has its advantages, as any shrinkage in the walls and material is not nearly so noticeable. And shrinkage is one thing that must be considered in these times, with unseasoned construction material, and since builders have been reducing the storey



Illustrating how back band can be manufactured to advantage

length to 8-6. It is a common practice to use studs cut 8 feet with a single stringer at the bottom and a double stringer at top, which is bound to show considerable shrinkage. The simpler the designs, the less labor in cleaning up. In addition simple designs seem to

Perspective view of house designed for Winnipeg Housing Scheme

Homes Built Under Winnipeg Housing Scheme

Terrace Houses Most Economical, but Difficult to Sell—Description of Semi-Detached Cottages—Permanent Class of Construction—Exceptionally Well Planned Embodying Labor Saving Features

By F. H. Parr, A.M.E.I.C.*

Many schemes have been submitted to the city of Winnipeg to meet the demands of small houses at a reasonable figure, but owing to the cost of land in the first instance, and the increasing cost of labor and material this year, the adoption of a small house with reasonable accommodation and cost to the prospective owner has been a difficult problem.

It was felt that a small house built within the means of the ordinary man would appear too small altogether, and would not convey from the exterior the excellent accommodation provided within, therefore, while adopting exactly the same plan, prices were considered and arrived at for the house as a single one, semi-detached and in terraces of six.

In the first instance it was considered more economical to build in terraces of six cottages, but the builder encountered such serious difficulties in the sale of the individual cottage that a general antipathy against terrace houses became evident in Winnipeg, although very popular in the East, so much so that he changed his plans to shingle and semi-detached cottages, however, the idea of building in terrace is not by any means given up, and it is hoped to accomplish the same this year.

Early in the year the writer undertook to design such a home as would meet the exigencies of the case, and having regard to economy of construction and cost of heat in the winter evolved the plan illustrated, and which is now being erected in three or four districts of the city.

A full basement is provided with cement concrete walls 10" thick rendered in cement and stucco, lighted from the rear with three windows, containing a furnace and a coal bin to store five tons, the quantity considered sufficient for an ordinary winter.

The first floor contains a small entrance lobby, a 4 in. by 10 ft., pantry 3 ft. by 4 ft. 6 in., and a hat and coat lobby at the head of the basement steps and cut off from same by a door 3 ft. by 5 ft. 6 in. The height of the storey is 8 ft. 6 in.

The verandah extends across the whole front and is 7 ft. wide, and there is a back landing and steps in the rear.

The second floor contains two bedrooms, that in the front being 12 ft. 4 in. by 11 ft. with closet 3 ft. by 4 ft. 6 in., a back bedroom 10 ft. by 9 ft., and a bathroom with full plumbing 6 ft. 3 in. square; the height of this storey is 8 ft. 6 in. at the slope line.

The outside walls are 17 ft. high and together with the party wall are being constructed with 6" by 12" by 12" hollow clay tiles with studs 3 ft. apart, and are finished with cement render and stucco on the outside and rough plaster, strapping, empire wall board and two coats of plaster on the inside.

The partitions and ceilings are lath and plaster.

The rafters are covered with shiplap, tar paper and slate shingles as manufactured by the Standard Paint Co.

The floors are carried on 2" by 8" joists which together with all studding, rafters, etc., are spaced 16" centre to centre.

The dormers to the second floor windows are thoroughly well sheathed, and covered with paper and shingles similar to the above.

Fir in doors, windows and trim together with edge grain in the floors is used throughout, and will be

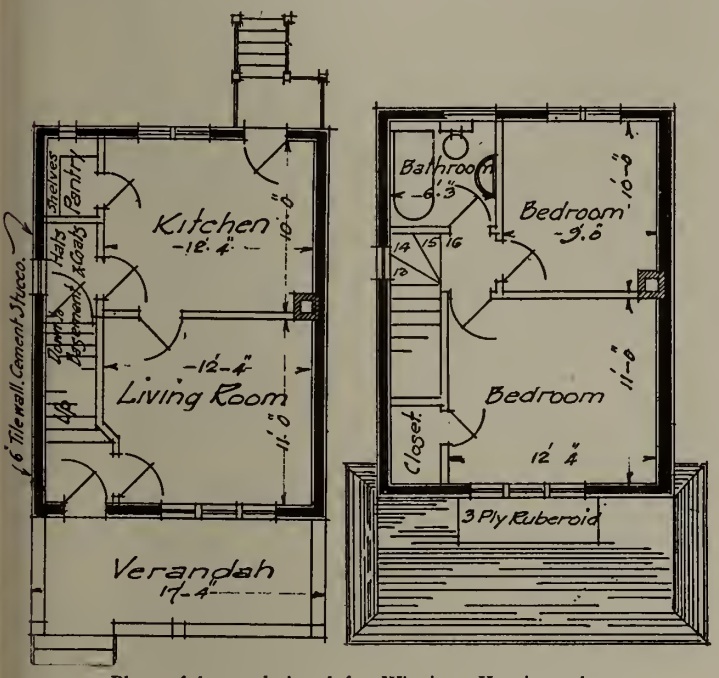
*Registered architect, Manitoba and Saskatchewan.

stained, shellaced and varnished with Manders varnish, the floors will be dressed and oiled.

The stucco coat is to be colored before being put on and the outside woodwork will be painted two coats.

The houses can be built on the following frontages: —single houses, 25 ft.; semi-detached, 50 ft.; and terraces of 125 ft. In this latter case the middle house will have 16 ft. 6 in. frontage and the end houses 29½ ft.

The city of Winnipeg grant the loan at the rate of 85 per cent. of the value of the house and lot, the



Plans of house designed for Winnipeg Housing scheme

latter not exceeding $20 per foot, and the repayment of principal and interest is spread over a period of 20 years with a combined monthly payment of $7.13 per $1,000.00 per month, the owner has the option of paying any further sum at any time without notice or bonus.

Statement of Cost

	Total Cost	City Loan	Cash Paym't	Month Paym't
Single Cottages	$4350.00	$3697.00	$653.00	$26.35
Semi-Detached Cottages	4150.00	3527.00	623.00	25.14
Terrace Cottages, Four Inside Cottages	3880.00	3298.00	582.00	23.51
Two Inside Cottages	4140.00	3519.00	621.00	25.09

No charge is made by the city for inspections, and the cost of transfer, etc., is included in the above cash payment, of course., to the above must be added the yearly taxes and insurance.

The scheme was worked out by the writer for Col. Norman J. Lindsay, of 402 Bank of Nova Scotia Building, Winnpeg, who will complete a number of the houses this year.

The writer has had considerable experience in municipal work and administration in connection with sewerage and sewerage purification particularly on the septic tank system, water supply and pumping, roads, etc., together with town planning and municipal housing schemes, which experience has proved of considerable value in connection with the plans described in this article.

Economy and Use of Knocked-Down Trim

(Continued from page 57)

suit the public demand. We are living in an age of almost "white interiors" and the plainer the surface of all wood work the better for an enamel finish.

Details A and B show the sections of plain trim with different sized cap moulds. C illustrates a very economical method of producing a cap mould. Material of 1½ x 5 in. or 1¼ x 5 in. stock as desired is run in long lengths to any required pattern, with corresponding double edge, then cut off in suitable lengths to work on square heads of doors and windows. Return heads to pattern on shaper, and then rip on fine rip saw, thus eliminating any bench work on mitre return, and also less fear of endwood being torn.

Panel Casing New Feature

Another very economical trim, one which is used very extensively by one of the leading young architects of this city, is the "panel casing," both in hard wood and trim for enamel finish. This casing is all square cut, and is very easily cleaned. As both sides are moulded, one is always sure of getting good edges. Used in special bedrooms, with the addition of a few compo crestings planted in the panels, corresponding with the bedroom furniture, a very neat effect is accomplished.

The greatest contribution, lumbermen, millmen and contractors can make towards satisfying the demands of their customers for homes is knock-down millwork.

Each millman who avails himself of the knock-down millwork service is serving the home builder and himself, eliminating delays, waste, disappointments, and above all cutting costs.

Market for Pianos in Egypt

Pianos, phonographs and other musical instruments are said to be in good demand in Egypt and other far eastern countries.. The present is the time for manufacturers of these instruments to introduce their goods into Egypt under most favorable circumstances, and it is pointed out that the market undoubtedly presents one of the most promising openings for the industry, in view of the greatly increased purchasing prosperity of the inhabitants as a result of the country's immense prosperity during the last few years. Turkey is another market which offers an undeniable scope. This market cannot be captured, however, unless something more substantial than catalogues be used. Articles de luxe find a ready sale at present among those who made money during the war.

Joint Rates Have Gone Into Effect

The order of the Railway Commission authorizing increases in the joint rates on traffic across the international boundary, has gone into effect. This order was made on the application of the American Railway Association, which represented to the Railway Commission that increases had been authorized by the Inter-state Commerce Commission on the United States roads, and that the rates authorized by that body should be made applicable to international joint rates. The order applies to all rates and charges which were increased under the order of the Inter-state Commerce Commission.

Are Lower Furniture Costs a Probability?

Labor and Material Controlling Factors—Demand Slack at Present—Retailers May be Playing a Waiting Game—Outlet for Surplus Overseas

By R. W. Wells

It is always interesting, and at times profitable, to speculate on the immediate future and to endeavor to forecast the trend of events, with their probable effect on general conditions, manufacturing costs and the different markets. Two questions of vital interest to furniture manufacturers are manufacturing costs and the probable demand for their product.

Is a decline in manufacturing costs, with a consequent reduction in selling prices, a probability in the near future? The three chief items entering into the cost of an article are, those of labor, and of raw materials as well as production. Let us examine each item separately and see if any declines are probable.

Efficiency of Labor Not Improved.

There has been no recent reduction in wages in any of our furniture factories. In several producing centres increases, averaging about 10 per cent., have been put into effect in the past few months. Production per man apparently has not increased, showing that there is not any marked improvement in the efficiency of labor. On the whole it would appear as if it would be safe to assume that labor costs will not show any decrease for some time to come.

Uncertainty marks the raw material markets. The different items entering into the manufacture of furniture are fluctuating from time to time. Lumber and finishing material have dropped in value, lumber about 5 per cent. and finishing material 8 to 10 per cent. A closer examination of the material list indicates that other items such as glue, hardware, packing and upholstering materials, are still on the upward trend. The increase in the latter articles more than offset the drop in lumber and finishing material. Again it is doubtful if many furniture makers stocked up heavily with lumber or other items when prices were at their peak, so that a slight drop in certain lines would not have any effect on present costs. Even on a falling market, and that does not seem probable, it would be some months before the lower values would show in cost figures.

Lessened Demand Means Higher Costs.

The question of production is a little more involved. If the amount turned out drops off, the cost to produce increases; for the ratio of overhead is higher as production falls. Production depends primarily on demand. At the moment the furniture market is quiet, in fact, buying has been slow for several months.

A survey of the retail field shows that business is fairly good in the smaller towns and rural districts and quieter in the larger centres. July and August are usually slack months so that a falling off in orders should not occasion any alarm. In spite of the prevailing slackness some of the larger retailers have been doing a good volume of business. As near as can be ascertained these same merchants have not been making any efforts to replenish their stocks. This may mean that they are playing a waiting game or they may be of the opinion that furniture prices are going to tumble. With a few months' orders on their books, the manufacturers can afford to sit tight and calmly await results.

In the ordinary course of events business should pick up during the coming weeks. Good crops, at good prices, seem to be the rule. This usually precedes an increased volume of trade. Should trade continue quiet for the fall months, it is to be hoped that no attempt will be made by the furniture manufacturer to stimulate sales by cutting prices, especially when such reductions are not warranted by lowered manufacturing costs. Such a movement, even in a small way, would demoralize the market for furniture and tend for even greater uncertainty.

In the event of a prolonged lull, it would be far better for the manufacturer to seek an outlet for his surplus by catering to an outside market. Good furniture, well made and well finished, is in strong demand in Great Britain and other European countries, and is commanding good figures. Other markets that are short of furniture are South Africa and South America. Australia is fast becoming independent of outside assistance as far as furniture is concerned. These markets can be worked to best advantage through a live, overseas agent. Finding an outlet for any possible surpluses would tend to stabilize the Canadian market. As an indication of the demand in outside fields, the British furniture manufacturers exported furniture to the value of $3,500,000 during the first six months of this year, this in spite of a shortage at home. This stock went largely to France, Belgium, South America and Egypt.

If business picks up before Christmas the retailer who refrained from buying did not play his cards correctly. If it remains dull, the manufacturers would simply play into the hands of the retailers, if they attempt to cut prices and compete for business. In any event as near as one can judge, lower manufacturing costs will not rule for the balance of this year, at least.

Furniture Manufacturers' Association in New Offices

The offices of the Furniture Manufacturers' Association have been moved from the Bank of Hamilton Building, Yonge St., to the Bank of Hamilton Building, Annex at 8 Colborne St. The new offices are very much more commodious than the old stand and will give ample space for the carrying on of the work of the association with a greater degree of comfort and efficiency. In laying out the offices a sliding partition has been installed so as to provide for an assembly room where the general meeting may be held. The offices vacated by the association have been taken over by the Home Furnishings Bureau.

Don't step over running belts if you have tails to your coat, or you may become part of the moving machinery.

Keep the bearings clean, free from oil, dust and fluff, as it is very likely to get alight during this hot weather.

Keeping Close Tab on Orders and Shipments

Simple System Facilitates this Work—Gives Perpetual Inventory—Triple Check on Outgoing Shipments and Invoices—Indicates How Lot Should be Finished

By Furniture Manufacturer

A very necessary part of the office work in any furniture factory is to keep an accurate and convenient record of all orders and shipments. The simpler the system can be, provided that the necessary information is promptly available, and that there is no sacrifice of accuracy, naturally the better.

I will outline a system I have used for many years, not with the idea that it is the best—for there may be better methods for all I know to the contrary—but with the hope that if any reader has had any difficulties in this department, he may be able to find something in this article that will be of some assistance to him. In the first place then when an order is received, it is at once copied on to an order sheet. This sheet which is given a serial number, is ruled in such a way as to provide spaces for all the information required, somewhat as shown in the accompanying illustration.

Using Indexed Cards Advantageously

When the orders for the day are copied on to these sheets (and of course the sheets may be ruled in any way you like to provide for information not specified in this sample) each article on the order should be entered on a card. These cards, an outline of which is shown, are placed in a card index tray, each in its indexed position, so that you can tell immediately how many unfilled orders you have for each article in each finish, and where they are to go to, also how many you have in stock in each finish available for sale.

As soon as the 6 No. 99 were shipped to Jones & Co. a line would be drawn through the "6" in the quantity column and the "12" in the last column but one. A "6" would be placed under the "12" in the last second column, showing the number of No. 99, in No. 20 finish in stock available for shipment.

Gives Perpetual Inventory.

The details of this plan will readily be grasped, I hope, by anyone interested and I shall not elaborate upon them, but one point I want to make is that you can instantly tell from the cards what orders you have on hand for any article. Whom they are on order for, and any other detail you may care to put on the card. The card also serves as a perpetual stock record for each article, if you record in the proper column the quantity and date started, the finish, when benched and change and figures in the quantity and the finished column when goods are shipped. Another purpose is served by these cards; we will suppose the 48 No. 99 started on July 20th (as per card) are benched, the card gives you information as to how the 48

99

Our No.	Their No	Customer	Quan	Col.	Fin.	Started	White	Finish #20	Finish G.O.
1000	954	J Jones & Co.	6	20	Dull	48	10	12	10
1009	72	B Smith	4	G.O.	"	July 20			
1017	2700	H Brown	6	#20	"				

Indexed card containing details of orders

should be finished, and you can have your finishing instruction made from it.

Now when we come to shipments; you have a list of the goods sent from the finishing room to the trimming and packing room each day, and you find amongst others 12 No. 99 in a No. 20 finish. You turn up card 99 and find 6 are for Jones & Co. and 6 for Brown & Co. You turn to order sheet No. 1000 and No. 1017, both located promptly because they are in serial order, and shipping tags are made from the

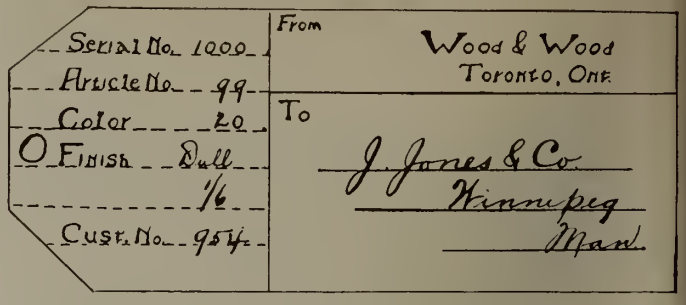
order sheets and handed to your shipper. At the end of his day's shipping your shipper hands a list of goods shipped to the office and as he has only shipped goods for which he had tags, and these tags were made from the order sheets, it follows that his list must correspond with your order sheet, and this serves as a double check.

Allows Triple Check on Shipments

Needless to say your shipping bills are also made from the order sheet, as well as your invoices, and as "things which are equal to the same thing are equal to each other," your invoices must correspond to your shipping tags. Your shipper's list will be compared to your invoice. In this way you have a triple check. In an experience of over twenty years of shipping, I do not recollect a single instance of an article being wrongly shipped under this system, or of an article being shipped (and this is of the most vital importance) without being invoiced.

Just a word in reference to the shipping tags. I stated above that shipping tags would be made from the order sheets, and would also say that it is well to have the shipping tags ruled in such a way as to provide for all necessary information to the shipper.

The space containing figures 1/6 is for the purpose of showing the quantity of this particular article in this shipment, viz., 6, of which this tag goes on the first, hence 1/6. The next tag would be 2/6 and so on.



Special shipping tag used

The advantages of this system are that you have your customers in alphabetical order, that you have all your orders serially numbered, that you have each article you make card indexed and both orders and stock lists on the cards, that you have a triple check on shipments. Further, there is very little duplication of work.

What Constitutes Adequate Fire Protection

More than Chemical Extinguishers, Sprinklers and Hose—Woodworkers Have Many Special Hazards—Careful and Constant Supervision Required —Bicarbonate of Soda and Sawdust Good Extinguisher

By F. T. Daniels

From the standpoint of the insurance underwriter, fire protection means much more than sprinklers, chemical extinguishers and hose streams. It is difficult for him to separate protection from the details of construction and the general fitting up of the plant. To him it means much that boiler house and shavings vault shall be well separated from the main work rooms, that dry kilns shall be of fire resisting construction and with ample spaces around and above the lumber. He also desires that the processes shall be properly located relative to each other and that in all cases there shall be ample room and proper facilities for the maintenance of clear aisles and excellent conditions of order and neatness.

For present purposes we may assume a plant well constructed and arranged in its main features and pass to the more specific items of protection. The matter of power is well worthy of a passing word. No doubt up to within a comparatively short time, the steam engine as the prime mover with shaft and belt transmission, has been most in favor. It is necessary that every reasonable means be taken to avoid friction, Shafting should be carefully maintained in alinement and ample room left at passages for belts, to avoid trouble. It should also be easily possible to reach all parts for cleaning and lubricating; of course good lubrication is very essential. Electric motors are coming into favor and there is no reason why electric power, properly managed, may not be entirely acceptable. It is not usually advisable, however, to employ individual motors, though some of the more modern enclosed types of motors present little hazard .

The heating system should preferably be steam coils or hot water radiators. In any case pipes should be kept at good distance from floors and walls and provision made against resting any materials on the tops of coils or radiators. It should be easily possible to clean thoroughly below and around all heating apparatus. There are many cases on record where steam pipes have for years passed near wood work without causing fire. Finally, fires have resulted under apparently no new conditions. The fact is, that a very long time may be needed for the wood to be reduced to a charred state, but having reached this point it is set on fire with comparative ease.

For the lighting of a woodworking factory, electric incandescent lights are satisfactory. The wiring should be done in the best manner, using conduits for the important lines. Fuse boxes should be made of non-combustible materials and so placed as to be free from dust and inflammable gases. Fuses of a correct voltage should be used. The same care should of course be exercised with respect to switches. Keyless lamp sockets are no doubt safest but not always practicable. Key sockets, if used, should be well constructed. The cost of good sockets is so slight that there is no excuse for using inferior devices. Where there are inflammable vapors, as in dip rooms, vapor-proof lamps should be used. In places where lamps are especially liable to be broken they should be protected by strong wire guards. Many accidents to lamps may also be avoided by connecting them through flexible electric cord an inch or two long instead of making a hard connection to the circuit.

Dipping Tanks Extra Hazardous.

Dipping tanks are well worthy of special attention. They should be provided with covers held open by fusible links and so arranged as to close by gravity in case of fire in the contents of the tank. The tanks should also have drain pipes of ample size leading

*Blackstone Mutual Fire Insurance Co., Providence, R. I.

from the bottom to some safe place of discharge outside the building. A quick opening valve should be placed on the drain pipe and located at such point as to be readily and safely accessible.

Glue pots may be heated by steam, hot water coils or by electricity. Gas should be avoided if possible. If it must be used, rubber tubing should in no case be employed, but all connections should be made with iron pipe. Guards should be provided, if necessary, to prevent inflammable materials from coming into contact with the flames. If electric heaters are used, the circuit should contain small red "pilot-lights" which shall show while the heat is under the pots. These lights should of course be so placed that they will be visible from all points in the room so that there may be no excuse for leaving the heat on at improper times.

Special Receptacles for Waste.

In well ordered plants there will be standard metal cans for the reception of oily rags and waste, and close supervision to see that these possible sources of spontaneous combustion are not left where they can do harm. For the same reason, overalls and jumpers of workmen will not be placed in wooden lockers or hung against partitions. Metal lockers should be used and these will be placed well away from partitions and preferably on a floor of non-combustible construction. Some careful managers will not allow the use of any lockers, but require that clothing be hung on metal racks. This has an advantage, for lockers are too often the receptacles of much objectionable material. A recent fire of considerable magnitude showed plainly that greasy clothing should be hung far enough away from other combustibles so that the clothing may be consumed without doing further damage.

Automatic sprinklers are too well known to need description and their value has been so amply demonstrated that no one should need to be convinced that they should be installed in every factory where there is combustible construction or occupancy. They should be supplemented, however, by an ample supply of fire pails or chemical extinguishers. There is considerable difference of opinion as to which of these is better, as "first aid." The fire pail is the simplest, and immediately suggests its use at the start of a fire. Quite often it appears desirable that both fire pails and extinguishers should be supplied. Another important adjunct is the small hose. This is usually 1¼ inch unlined linen with ⅜ inch nozzle.

Treated Sawdust Good Agent.

It should be remembered that water, however applied, is not a good extinguishing agent for fire in such materials as gasoline, paint, varnish and japan. For this kind of fire, the sand pail is also discredited. It has been found that a good extinguishing agent is sawdust mixed with bivarbonate of soda in the proportion of ten pounds of the latter to a bushel of sawdust. This mixture should be kept in bins near the point of possible need and a part of the outfit should be a long-handled shovel ready for instant use in applying the sawdust.

Another excellent means of extinguishing such fires is found in the use of extinguishers of the usual form charged with the constituent elements of "foamite." On applying this to the fire, a thick blanket of foam is produced which floats on the surface of the burning material and gas is liberated which smothers the fire. It is highly important, however, that for any given service, the extinguishers shall be provided in numbers and capacity sufficient to entirely smother the fire which may result from the amount of the combustible material to be used.

Lastly, it must be kept constantly in mind that no protective system can do itself credit unless it is maintained in perfect condition, and that no factory is running at maximum safety unless all combustible waste materials are promptly removed to points where they cannot do damage. The greatest danger to the protective system is that valves controlling the water are so often left closed after repairs to the piping system or for a variety of other reasons. The most careful and constant supervision should be given by the factory management to see that all protective agencies receive perfect maintenance and that those who are concerned in their use understand their construction and the conditions under which they can best perform their mission. Perfect order and neatness of the plant added to a proper fire protective system, will go very far to insure that the plant will not be interrupted by fire.

Workmen Lose As Well As Owner

Fire Prevention Vital Problem of Employee—Closer Co-operation Between Owner and Workman—Care and Cleanliness as Antidote—Large Proportion of Loss Preventable

By Geo. F. Lewis, Deputy Fire Marshal of Ontario

Self-satisfaction and contentment with present conditions is a most dangerous factor in the life of an individual, a business, a community or a nation. No great thing has ever been done without a vision and there exist in every community the forces and the ability to solve that community's problems. They may be and frequently are, undeveloped, but they are none the less there. These forces must be sought out, stimulated, trained and developed, and then applied to problems of the community. Efficiency follows organized effort.

A normal man or woman is bound to be vitally interested in the health, happiness and general welfare of the community in which he or she lives; and, according to the laws of nature every man is equally interested in the progress and prosperity of the business with which he is connected and which is functioning to give him a livelihood.

The lumber and wood-working business from a fire prevention standpoint has peculiarities of its own and these conditions should be carefully studied and corrective as well as preventive measures adopted to protect and safeguard the individual business from fire so as to insure its continuity as well as its permanency as a going concern, one which has probably taken many years to establish.

Stand on Common Ground.

Here capital and labor stand on a common ground, for while capital may be partially protected against

loss by fire insurance, labor has no protection and quickly finds that its means of support has vanished. To the man behind the bench, therefore, I most strongly appeal for co-operation in the Fire Prevention Campaign now sweeping broadcast throughout the land. Causes run in parallel lines. The great cause of fire and the great cause of disease are the same. Care and cleanliness are the antidote for fire as well as the antidote for disease. Eighty per cent. of the fire disease is preventable.

Wastefulness is one of our besetting sins, and fire waste is an economic crime, caused principally by carelessness and indifference. The fire waste in Ontario, not including forest fires, during the year 1918 amounted to $15,673,240. Caused by 9,740 fires. In 1919 the loss in the province was reduced to $10,514,-232 or 33% less than the year before. This saving of over five million dollars to the province was largely due to the support and co-operation of the magazines, the press, and the people, in the work of "fire prevention."

The enormous fire loss of the North American Continent amounting to more than three hundred and fifty million dollars annually, is one of the most important contributing factors to the high cost of living. What is burnt is irretrievably lost. To make up this stupendous amount of money an indirect tax is levied on every man, woman and child in the country. It is assessed on everything we eat, drink and wear through insurance premiums, collected and distributed by the insurance companies. The more fires we have the more the insurance companies must collect to pay the losses, and the less we have to spend for other things. The bread you eat and the coat on your back are insured through all their transitory stages; and finally you pay the cumulative premium when you buy the wholesome loaf and the suit of clothes.

Enormous Economic Waste.

Let me emphasize in the strongest manner possible that millions of dollars' worth of our substance is going up in smoke every month. Warehouses, grain elevators, factories, dwellings, lumber yards, mills, boots, dry goods, the products of the farm and of the forest are being destroyed by fire at the rate of thirty-three thousand dollars a day in this Ontario alone.

Two out of every three fires occur in our homes, which is a serious matter to contemplate when we consider the housing problem and the high cost of building material. It is yesterday's dirt that always starts the fire. The factories and industrial plants are, however, responsible for the big losses. Approximately five per cent. of the entire number of fires occur in this "Classification" and are responsible for nearly fifty per cent. of the total amount of the annual loss.

More than four times as many people are burned to death every year in Canada than are killed on steam and electric railroads. It is estimated that thirty thousand human beings are sacrificed yearly to the fire demon on the North American Continent. Fire is a good servant but a bad master.

Is there anything more important for us to do than help stop this wanton destruction of life and property, eighty per cent. of which is preventable. When the people decide to put the same energy into production and the conservation of necessities that animated them during the war, social unrest will be dissipated and high cost of living problems will be quickly solved.

This direct loss of millions, and an indirect loss of millions of dollars more, can be prevented and the money thus saved used to build up the resources and assets of the country if our merchants and manufacturers would but stop and think what precautionary measures should be taken in their individual cases. In your business the necessity of taking preventive measures, and the need of adequate protection are paramount. Study out your requirements, diagnose the case, and adopt the best and most practical methods of preventing fire. Avoid accumulations of rubbish, shavings and litter as you would the devil. If there is nothing to burn it is hard to start a fire. Next to order and cleanliness, inspection, automatic sprinklers and watchman service should be adopted.

Maintain Adequate Protection.

Have a reliable, mechanical check on your watchman that cannot be tampered with. Let him make his rounds every fifteen or twenty minutes. It will keep him awake and prevent thieves, firebugs, and boys playing with matches, from taking advantage of long periods of time elapsing between rounds.

In addition to having chemical fire extinguishers, of approved design, located at convenient points, it is well to have fire buckets, filled with water also scattered around. For effective work in quenching a fire add three-quarters of a pound of bi-carbonate of soda to each gallon of water in fire pails and casks. In unprotected places these may be kept from freezing by adding calcium chloride in varying quantities; ranging from half a pound of calcium chloride per gallon of water at twenty-nine degrees Fahrenheit to five and a half pounds where the temperature goes down as low as 50% F.

Automatic sprinklers are always on the job and when properly installed with sufficient water supply at proper pressure, and the equipment maintained in a constantly operative conditions have proven to be the most reliable and satisfactory fire extinguishing device in use. Out of fifteen thousand fires tabulated by the National Fire Protection Association where sprinkler systems have been installed, eighty-five per cent. were extinguished by one sprinkler head.

Forbid smoking in your premises unless in a room of fire-proof construction especially set apart for the purpose.

Forestall Spontaneous Combustion.

Spontaneous combustion frequently takes place in oily waste or heaps of rags soaked with oil; also in piles of sawdust, especially if it is very fine. Standard waste cans with self-closing lids should be used as receptacles for oily waste or oil-soaked material and as these become useless they should be burned in the furnace every day before closing.

Fire doors should be kept closed when not actually in use, especially at night, and they should always be kept free from piles of merchandise or other obstruction.

Faulty construction, an important topic in itself, is a serious fire menace. Openings in fire walls or small apertures made for pipes should be properly protected or closed up. Through these small openings fire travels very quickly.

No matter how young, how inexperienced, how insignificant our physical strength may be, or how small a part we may be assigned in the cast of life's drama, we have potential resources that can be applied in the work of conserving the lives and resources of our people. Especially is this obvious with regard to the prevention of fire.

The Art of Perspective Drawing

The Ability to Make Perspective Sketches is an Asset to Every Woodworking Employee—Obtaining Sizes From Photograph or Perspective Sketch—Securing the Perspective

By Arthur Kirkpatrick*

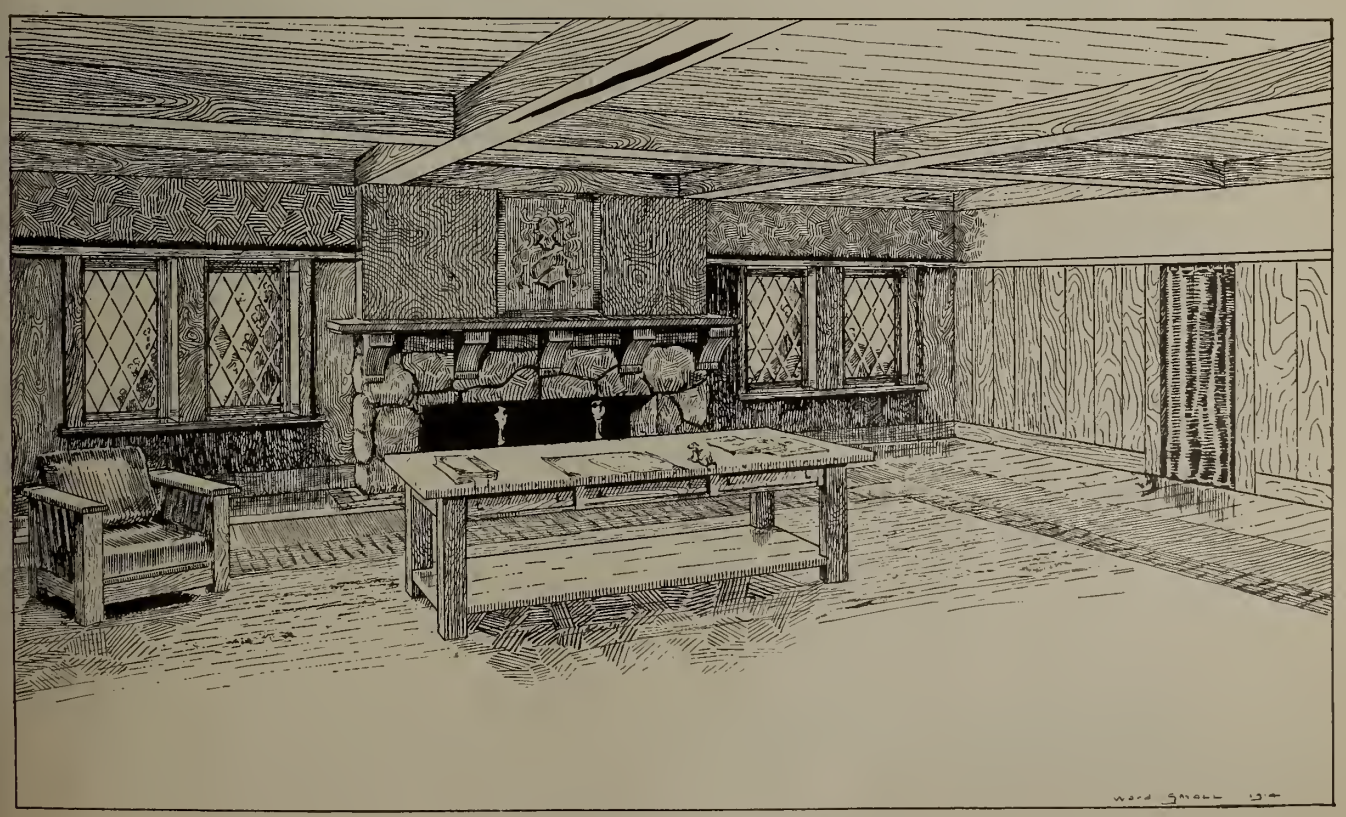
There is no manufacturer of furniture, no superintendent nor foreman of a furniture factory who has not found it necessary, at some time, to illustrate, or to make plain his ideas by drawing, thus saving long verbal explanations. The ability to make a quick pencil sketch in correct perspective requires some knowledge, and a study of the rules of perspective will repay these men manifold.

There are a few fundamental laws of perspective which are easily understood, and when one works in accordance with these laws, he will surely produce results. There are still other laws, beautiful to comprehend, but not absolutely essential to practical sketch application as used in the furniture factory. For instance, all light, shade and color are different degrees of vibration which proceed from the object viewed by the eye. There is no power in the lily which goes out to the sun, the sun's heat and light come to the lily. As it is buffeted about by the worldly winds, the lily reaches up, nods, and breathes out its perfume as if in praise and adoration. Neither is there a power in man which goes out to the landscape. The landscape comes to him, it enters through the windows of the soul, and is recorded by the law of the great Artisan on the scroll of character. The burning of incense shows man's first faint effort at emulating the lily, for the upward drift of the smoky odor gives the outward and visible impression which natural law performs in secret. Man, too, is buffeted about by the desires and passions of the world, and must needs return some beautiful thoughts of good character—equivalent to the lily's perfume. Thus even in such a mechanical study as perspective drawing, one may "consider the lilies of the field—how they grow."

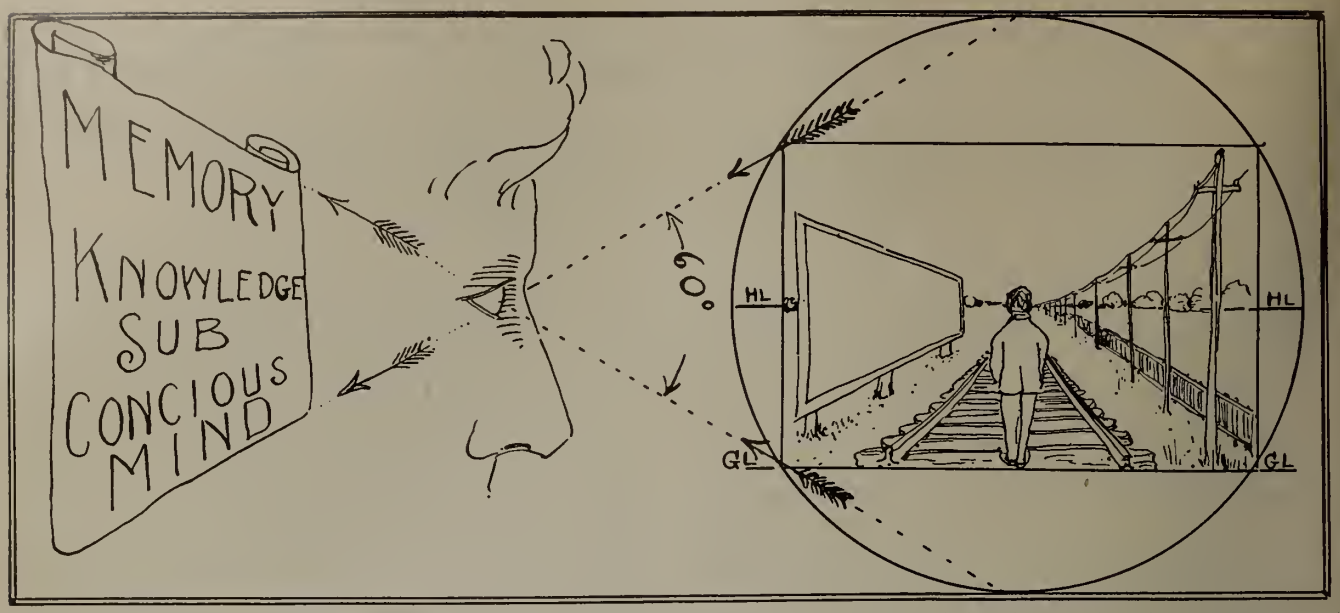
The method nature uses to aid us to visualize distant objects with a relative knowledge as to their size, shape and color is called perspective. A drawing or diagram made for the purpose of illustrating this method is called a perspective drawing. Perspective drawing is usually described in two divisions, ariel and lineal perspective. Ariel perspective pertains to the drawing of clouds in their different formations so that the required distant effect in landscape drawings and painting is secured. Lineal perspective refers to all diagrams and drawings made up of lines, showing objects varying in position, shape and apparent distance from the eye. Lineal perspective is the kind furniture workers are most interested in on account of its application to the many problems of the furniture factory.

One will note, in beginning a study of this kind, that erect or vertical lines which are parallel and appear to coverage should never be drawn as they appear, but vertical. All horizontal lines not at right angles with the observer will meet on horizon line and the places of meeting will be designated as Vanishing Points or V. P. The horizon line is always on a level

*Instructor, Grand Rapids School of Designing, in the "Furniture Manufacturer and Artisan."



Drawn by student from instructions given

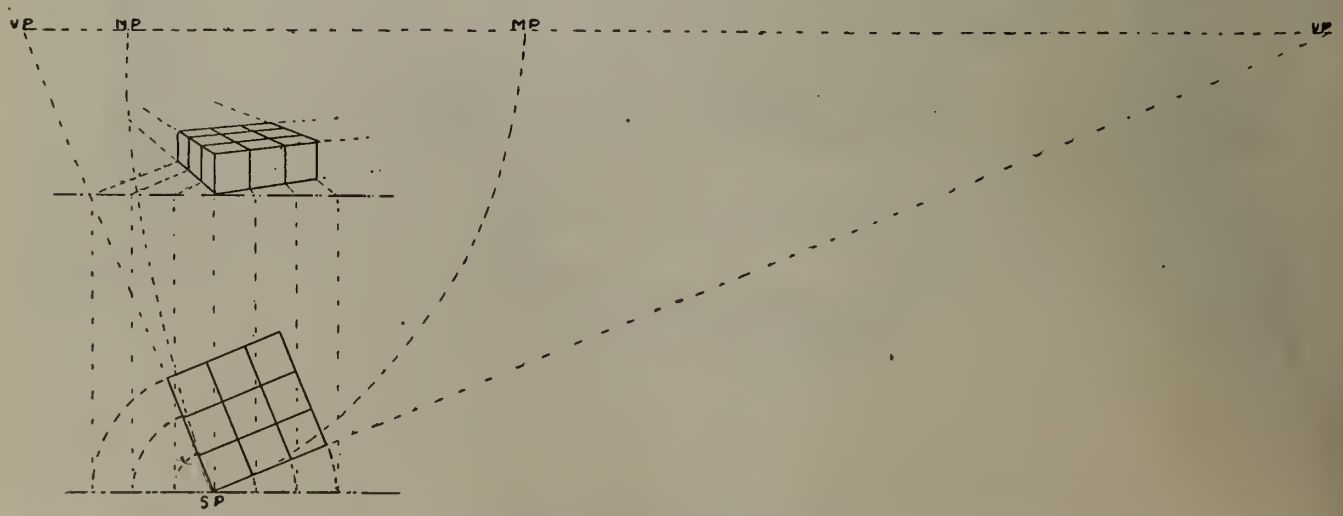


The scope of man's vision is about 60 degrees, and a picture drawn or painted must be represented within this scope in order to appear natural to the observer

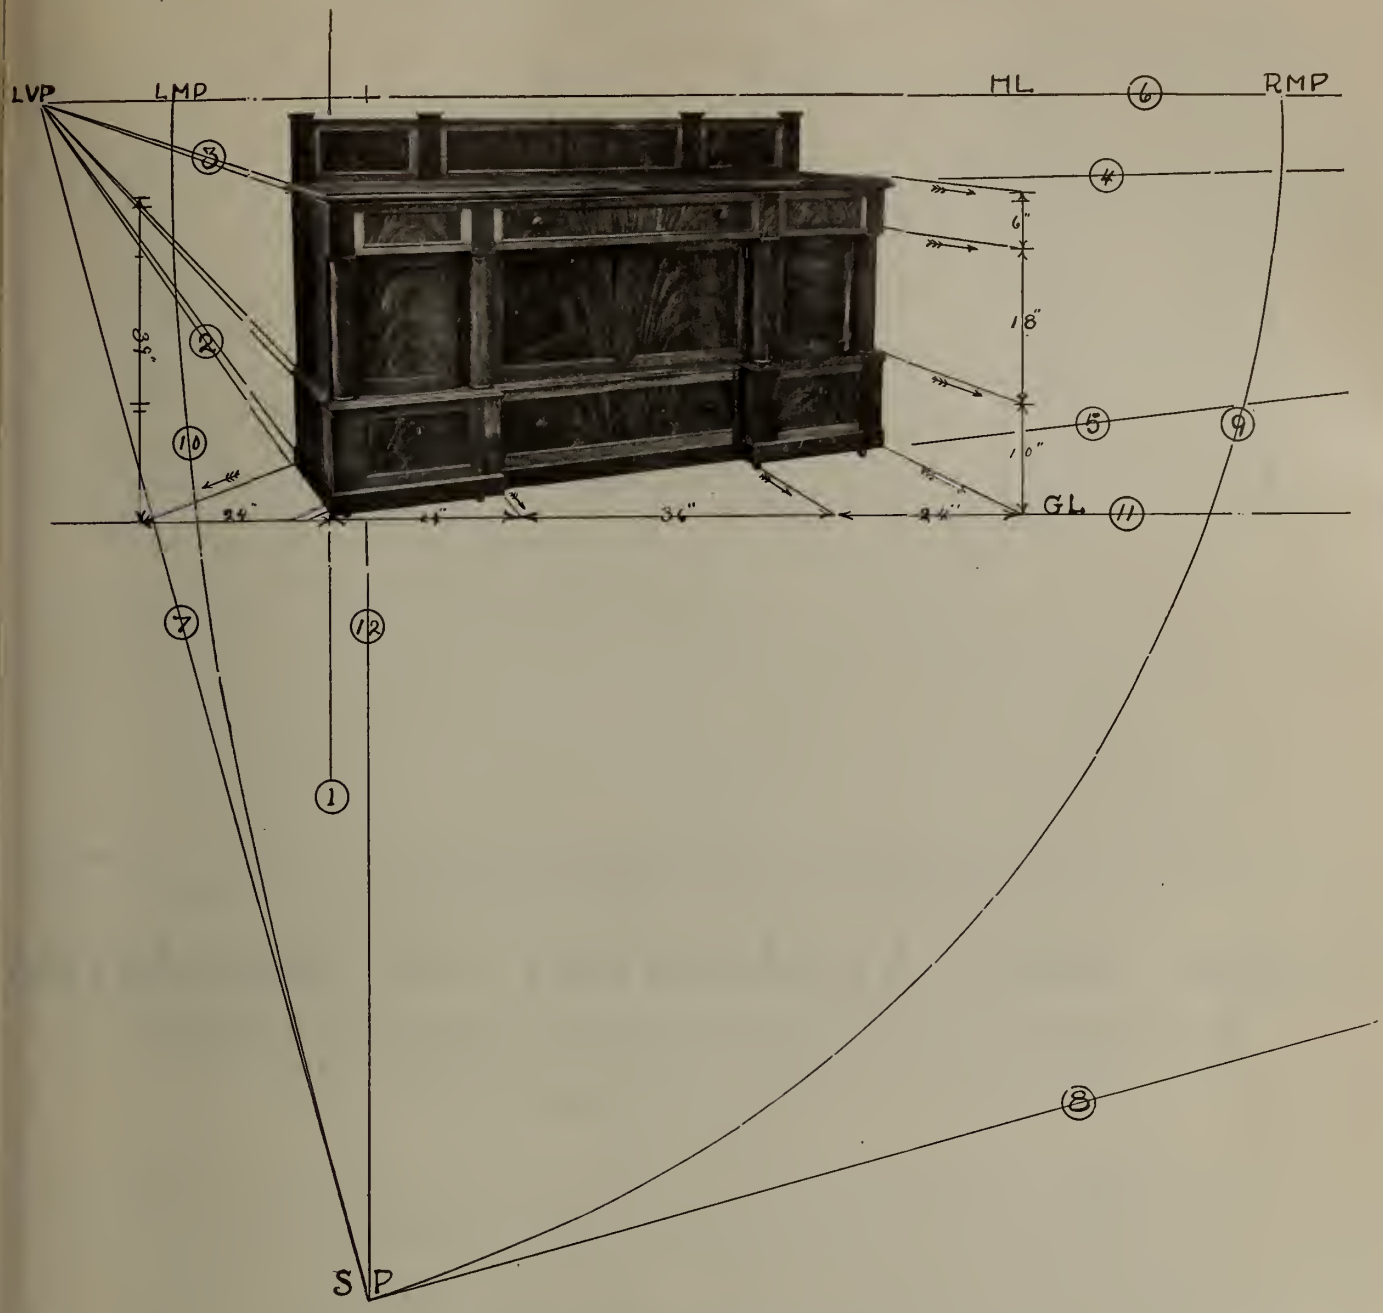
with the eye, that is, it represents the eye height in the picture of drawing. In a landscape, this line is formed where the sky and earth appear to meet. The horizon line will be marked on the diagram as H. L The lower edge of the picture is called the ground line or G. L. All measurements which pertain to heights of objects are taken from the measuring lines. The ground line must be the base for all measuring lines. The apparent height and size of an object depend upon the square of the distance represented between the object and the observer. Measuring lines and measuring points will be designated as M. L. and M. P., respectively. In a general way, one will notice that all lines above the level of the eye tend to fall toward the horizon line, while all lines below this level will rise to the same line, and will have a common place of meeting, at the vanishing points.

These few rules, jotted down in apparent confusion, will be more easily nderstood if studied with explanatory diagrams. One will find it interesting and instructive to take a paper and pencil and work out a perspective drawing with the purpose in mind of aiding one's self to a better understanding of the working laws back of this study. Commence by laying out a plan of the object to be drawn, next place a station point below the plan and mark S. P. This station point represents the point one stands upon when viewing the object. As the scope of human vision is about sixty degrees, be sure to place the point far enough below the plan so that the plan will easily come within the sixty degrees. Next draw lines from tha station point to a line representing the top edge of the picture, which is called the picture plane, and marked P. P. These lines should be parallel to the sides of the plan, and if the plan is square the lines will be at right angles with each other. These lines are called parallel lines, and are market P. L. upon the diagram. The parallel lines will meet the picture plane directly over the vanishing point, V. P. When you have established these lines to your satisfaction, follow the instruction lines marked with arrows to complete the drawings.

One will find it very difficult to put the fundamental laws into intelligent order without many examples explaining special features of this many-sided study. Suppose some customer has a photograph of a certain piece of furniture which he desires reproduced. He does not know the length, width or height, still he likes the general proportions as represented in the pitcure. To work out a whole detail of this piece would hardly be considered a task by one understanding the laws of perspective drawing. If he can draw a picture from a sectional plan, he can, by reversing his operations, draw a detail sectional plan from a picture. If any reader of this brief synopsis of the art of perspective



Showing method of drawing pile of blocks



Illustrating method of obtaining sizes from photograph or perspective drawing*

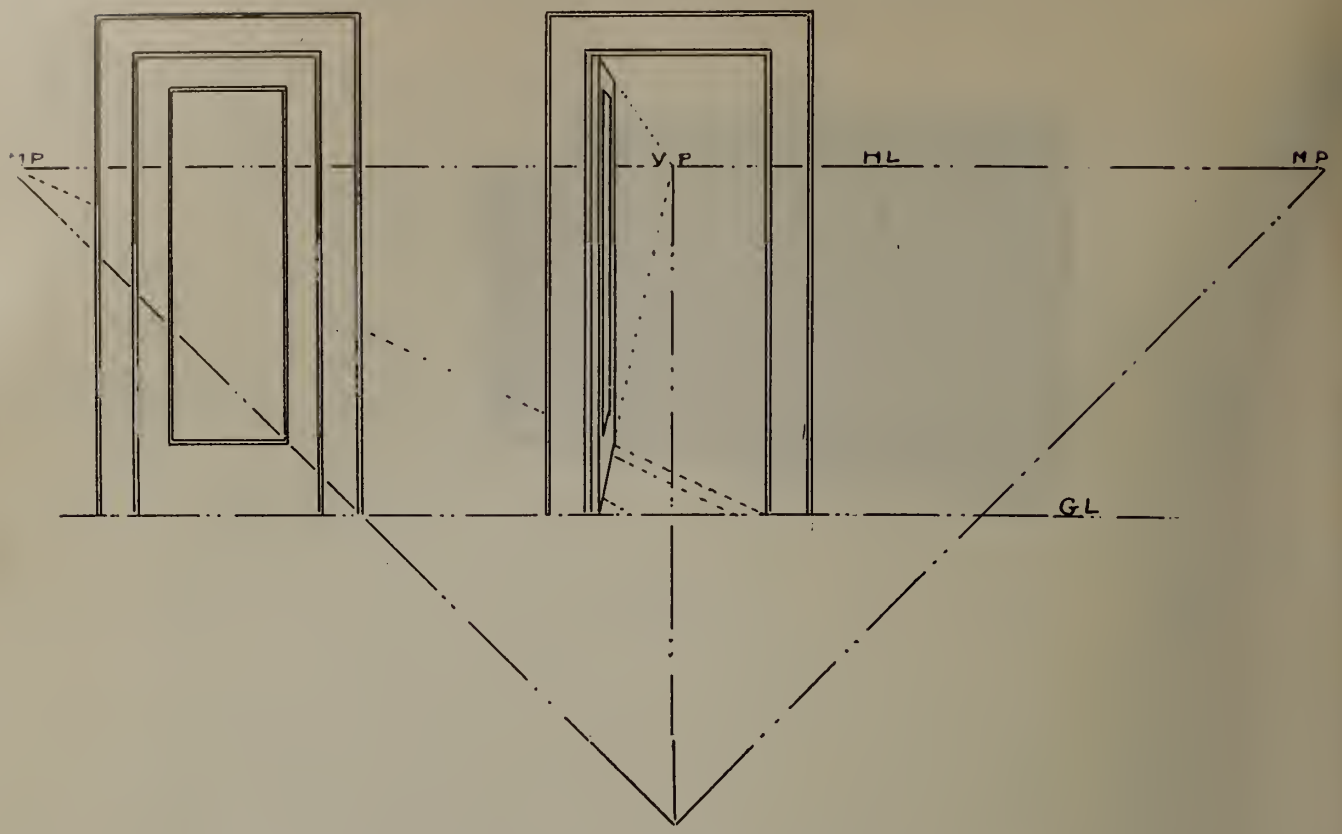
drawing be inspired to further study, he should endeavor to work in such a way as to lead him from the simple to the complex by a series of plates which are progressive in their subject matter.

As the student receives more light on this subject, he will see that pictures are not alone in the working of the law, for there is a perspective of evolution of history, of man's character, and of the growth of language from our most remote ancestors apeing at natural sounds down to the wonderfully complex but comprehensible methods of learning now in use.

Horace Dodge, an American automobile magnate, is building a yacht that is to cost in the neighborhood of $1,000,000. When completed this will be one of the most expensive private yachts in service on this continent. The boat is to be 250 feet long and is built for both inland lakes and ocean travel.

*First place the picture on a drafting table in accordance with the perpendicular line marked 1. This line should be drawn in line with the nearest corner of the object. Next draw lines, 2, 3, 4, 5, extending same to the right and left until they meet, and unite the two meeting points to a line marked 6. Line 6 is called the horizon line, and the places where the returning lines meet are called vanishing points. From the vanishing points, draw two lines at right angles to each other. These lines, marked 6 and 7, should meet under the nearest corner of the picture, and the place of their meeting is known as the station point. With the left vanishing point as a center and the station point as a radius, strike an arc or curved line and mark 9. Where line 9 intersects the horizon line (6), it furnishes the right measuring point marked R.M.P. Duplicate the operation from the right vanishing point and it will give you line 10 and the left measuring point (L.M.P.). Next draw the ground line marked 11 on the diagram. This line will be parallel to line 6, the horizon line, and will touch the lower edge of the picture. This line 11 is the base line for all measurements. Use the measuring points as centres and draw lines indicated by arrows, and the result will be that you obtain spaces on the ground line that represent sizes of the different parts of the picture.

By a general comparison, we find the base mould to be three inches wide, and using this measurement as a scale, we are able to determine the other measurements. The top is 24 by 84 inches, allowing for casters and top it is 39 inches high without the back, that it has an 18 inch column turned from 3 inch stock, that it has an offset in the base of 2½ in. Line 12 is called the vision line, and by it we are able to figure that the camera was nine feet from the object, and that the lense was 52 inches from the floor. With this knowledge at his disposal, any good draftsman can detail in full the object thus unfolded.



The lines on top and bottom of closed door are parallel and at right angles with the observer, while the lines on top and bottom of open door are retiring and therefore converge at a vanishing point upon the horizon line

Value and Application of Standards

Figuring Standard Time—Allowance Made for Rest Period—Calculating Percentage of Efficiency—Team Work Desirable Asset

By James J. Martindale*

(Second of series)

Consider the Indian with his pack making the portage. As far as the path over which he makes his journey is concerned, this has probably been in existence for many years. The Indian has no control over his route except for the occasional chopping out of some fallen tree obstruction. His track maintenance cost is nil. Nature supplies the footing, renewing it from time to time by her ever-bountiful supply of grass here, fallen leaves and twigs to cover up this sharp point of rock, or fresh moss on the side of that large stone where it was torn off last year in a nasty fall.

However, the Indian has control over his own dress and the load he is to carry. He can plan, schedule, route and dispatch himself. Firstly, as far as his dress is concerned, he is always ready for the job. Whoever heard of an Indian having tight and painful mocassins or boots or clothes? His footwear and the looseness and support of his clothing are all helpful to his task and not a hindrance—he has standardized his clothing to his own particular requirements.

Comfort and Efficiency Go Together.

The load will be placed most carefully. The heavy articles will be put at the bottom of the pack and the corners of any sharp pointed substance will be well protected by the plentiful use of socks, clothing, etc., so the load will feel comfortable to his back. When the packing is completed the load will be "hefted." It may be pounded on the ground two or three times in order to settle it and probably tried on the back to see how it fits. The load will then be picked up, carefully adjusted as to the location of its supporting straps and the journey commenced.

A pace which could be kept up for hours if necessary would be started. At certain intervals, a relief to tired muscles is obtained. When desiring to rest, the pack would not be removed from the back but a log would be found against which the Indian might sit, with the bottom of his pack resting thereon.

In the case above mentioned, the Indian has standardized his operating conditions in so far as he is able. He knows he can maintain a pace of 2½ to 3 miles an hour over the uneven path, provided he has a load comfortable to carry. He finishes the task in a comparatively fresh condition.

Analyzing Plant Conditions.

The problem of the manufacturer is similar to that of the Indian. He has no control of the troubled road over which he has to travel today. He, himself, cannot prevent coal strikes, switchmen's strikes, lack of steel or scarcity of wood. But he can control to a considerable extent his own immediate plant surroundings which have so much to do with the success or failure of his enterprise.

How should the manufacturer go about this problem? 1. Analyze plant conditions to discover plant

*James E. Morrison Co., Industrial Engineers, Detroit, Mich.

troubles. Find the congested (tight shoes and clothing) which hold up the flow of production. 2. Ascertain the best manner in which to control and move the material—is the trucking adequate and proper—does it function at the right time or is it generally late? 3. Are the plant conditions such—considering light, sanitation, air, etc., that the worker feels in a good frame of mind? Can he do his best—is the "load" he has to carry made comfortable for him—has he no distracting, disturbing sharp points of worry to prevent his continuous efforts?

Perhaps it is necessary to spend months in bettering conditions before a beginning can be made in the setting up of marks of accomplishment, or it is at times possible to make a start on the work of standardization in some well developed department and devote needed attention at the same time to other departments which are out of date in the conditions surrounding the worker.

Not to be Done Haphazardly.

In any event, in taking up betterments of this nature, it is most essential that the official in charge be relieved of his usual routine duties, to devote his entire working time to the problems in hand. Where industrial work has been inaugurated by the home organization, failure has marked many such attempts, principally because such work has been considered just as an additional burden to an official already well loaded up with his regular duties.

When this work has been accomplished, an acquaintanceship among the workmen has been made which is most important. They have been benefited, Vexatious troubles have been reduced—the spirit of the department or shop improved—"Individual Responsibility" is being experienced. The men gain faith in the company and their bosses.

Did you ever sit in an "eight" or play on an "eleven" and notice how those awkward actions, those faults due to inexperience, slowness or over-zealousness are slowly overcome and in time the men made to work as a unit? But to accomplish that change, the conditions of action or work must be right. The seat runners of an "eight" have to be well oiled,—the foot rests adjusted to each oarsman—the oar locks made to fit the man using the particular oar. The movement of all backs and legs and arms and wrists of the crew of an "eight-oared shell" must be synchronized. Any obstruction to the properly timed slide of one man can throw the whole boat off its keel and disrupt the swing of oars and the "run" of the shell.

Teamwork and Individual Responsibility.

The conditions to be striven for in the shop are similar to those exhibited in a well-trained "eight"—teamwork. Individual Responsibility, lack of annoying discomforts — everything so planned that the worker can do his best for the success of his department and company—is able to devote his mind continuously to the task in hand.

Assuming the betterments necessary and preliminary to the study of the jobs themselves, under way and substantial improvements obtained, what is the next step? It is a matter of recording facts and using horse sense in analyzing the information obtained for the purpose of setting standards.

In figure 1 is shown a sample time study form. It will be noted that observations of each elemental operation have been made and set down making a total of 100 observations in all. At the left under the column heading Sub. Oper., are noted the symbols applying to each elemental operation. The symbols are used as a means of shortening labor in naming the operations. At the right is shown a column for "low" time and one for "allow" time. The "low" time column is used to record the low time appearing in each operation. It is merely a guide to the observer in setting up his "allow" time.

The judgment of the observer is displayed in the times set down in the "allow" time column for each

$\frac{6.24 \text{ Min} \times 100}{60} = 10.4$ hours per 100

Time study card showing how operations are analyzed

sub-operation for the purpose of building up a standard time of the whole operation. The splitting up of an operation into its elements as shown, permits the observer to form a close estimate of the time necessary for each elemental operation, which built up with the other elemental operations into a complete operation, is more representative of the true possibilities of the job than if times were observed only on the complete "floor to floor" operation. The summation of the elemental times in the "allow" column gives a total time for the complete operation of 5.20 minutes per piece. This figure is compared to the totals on the horizontal line marked "total," as a check upon the judgment displayed in setting up the supporting figures for the "allow" time column.

Rest Period a Factor.

A standard time is that time which an average man after a reasonable period of instruction and experience can equal. It therefore must include, in order to be just, a reasonable allowance for rest periods and personal necessities of the worker. This allowance is in the form of a percentage and ranges from 10% up. On light work such as sewing where the operator can sit down most of the day, 10% or 12½% is sufficient. On work requiring greater effort and therefore resulting in more fatigue, a higher percentage must be allowed.

Frederick W. Taylor, in his Masterpiece, "Shop Management," gave a 30% allowance for shovelling. In moving pig iron or carrying very heavy loads, a greater allowance would probably be necessary. In the case illustrated, the allowance percentage being 20%, a total standard time of 6.24 minutes per piece is obtained. For convenience, this is changed to an hour per 100 basis by multiplying by 100 and dividing by 60 and the final standard time is 10.4 hours per 100 pieces. If one operator turned out 70 pieces in 8 hours, his standard hours would be 7.28 and his efficiency 91%. It is expected that the average operator after experience, can attain and continue to equal this figure of 10.4 hours per 100 pieces while the expert will exceed it. This is as it should be.

Application of Ball Bearings to Shapers

Enables Higher Spindle Speeds to be Maintained—Smoother Work and Increased Production—Lower Power Consumption and Freedom From Trouble—A Few Timely Suggestions

By G. C. V. Hewson

Few developments in recent years have so completely revolutionized woodworking machinery as the application of ball bearings. The primary cause for this remarkable change has undoubtedly been the ever increasing cost of labor. To compensate for higher wages, it became necessary to increase production and this could be accomplished most readily by increasing the speed of the individual machine. It was soon found, however, that there was a very definite limit to the speed at which bronze and babbit bearings could be operated. What was more natural than that the more enterprising designers should turn to ball bearings in an effort to eliminate this difficulty.

The first attempt to apply ball bearings to woodworking equipment on a commercial basis, was made in Sweden in 1907. The scheme proved a success from its inception and ball bearing equipped woodworking machines rapidly developed into an accepted standard in Europe, as well as on the North American continent. The success of this movement was marked; for

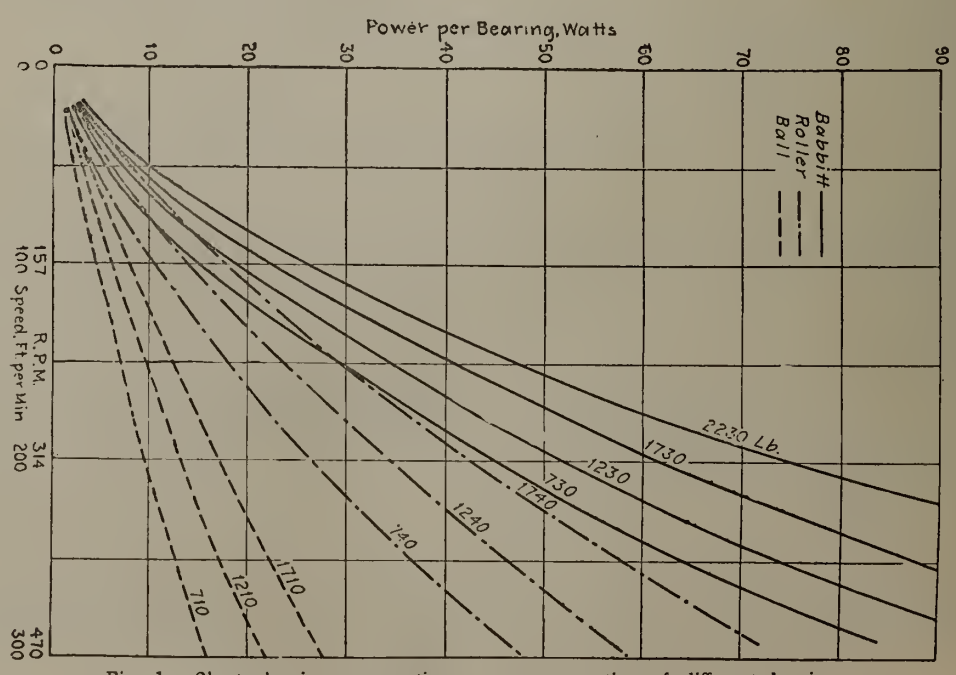

Fig. 1. Chart showing comparative power consumption of different bearings

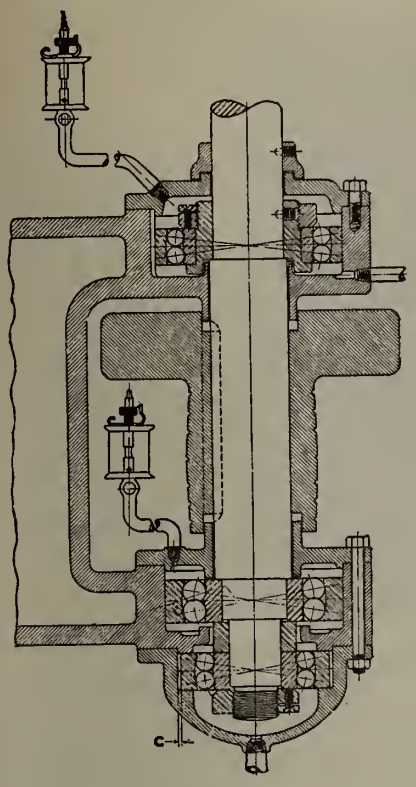

Fig. 2

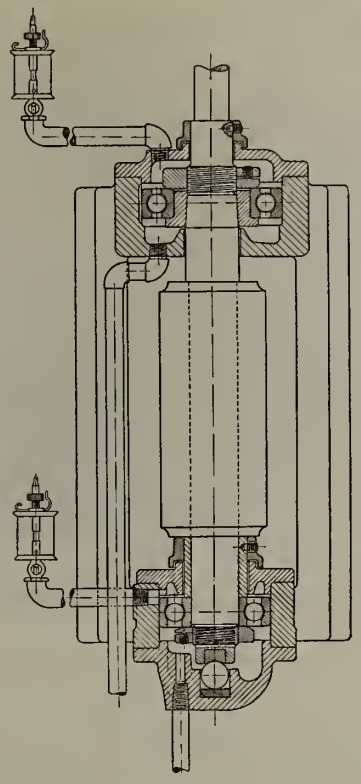

Fig. 3

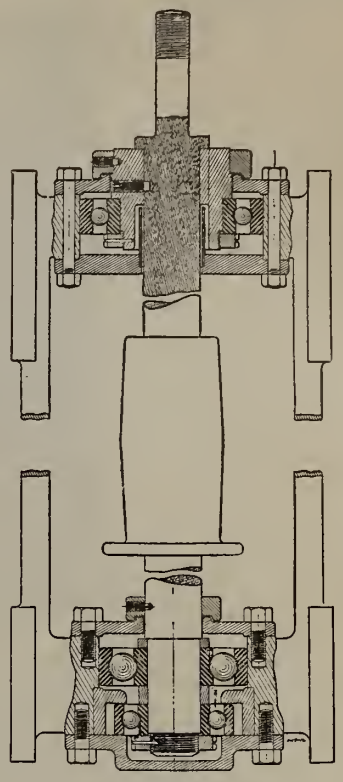

Fig. 4

not only was the primary essential of high speed obtained, but numerous other advantages were secured as well, such as: better work, less power, less oil, cleanliness, accuracy of alignment and freedom from hot boxes with the consequent reduction of fire risk and saving of time through the elimination of shutdowns.

Effects Saving in Power

One of the machines to which these advantages apply most effectively is the shaper, because of its necessarily high speed, and the fact that the friction loss in shapers with plain bearings is from 60 to 70 per cent. of the power delivered at the belt. About 65 per cent. of this lost power can be saved by the use of ball bearings. This means a saving of from 40 to 45 per cent. of the total input power.

The difference in power consumption between plain bearings and ball bearings is shown in Fig. 1, each curve giving the power required per bearings (of the kind indicated), to run a shaft, under the load, and, at the speed, shown, and it will be seen that the excess of power for babbitt over ball bearings increases for all loads with the increase of speed.

The lowest coefficient of friction of well lubricated plain bearings is about .025, whereas good ball bearings have a coefficient of friction of approximately .003 and within very wide limits, this is independent of speed. As an illustration, a machine which required five horse power to overcome the friction of well lubricated plain bearings would require 5 x .003/.025= 3/5 horse power when equipped with ball bearings.

But of far greater importance than this saving in power is the extent to which the spindle speed may be increased. The result of this is two-fold. In the first place, the higher the speed, the greater production becomes. A well designed ball bearing shaper will turn out about twice the work of a plain bearing shaper with the same number of spindles, secondly, the higher the spindle speed the finer the finish that is given the product, irrespective of whether it is cutting with or against the grain, so that very often sanding is not required. This is of importance, because sanding usually means considerable expense and in shaper work it often amounts to twice the cost of the work itself.

Mounting of the Spindle

In designing a spindle mounting, it should be remembered that the shaft is short or medium and its speed is high. The radial load carried is light, but in addition there exists a small amount of end thrust, due to the weight of the spindle, which must be taken care of.

Fig. 2 shows a mounting where SKF self-aligning bearings are used and it is a design which has proved extremely successful in practice. The upper and middle radial bearings carry the radial load, whereas the lower bearing is held only for thrust. It may seem curious, at first sight, that a radial bearing should be used for this purpose instead of a thrust bearing, but a little consideration will reveal the reason.

If a thrust bearing be run above a certain speed, governed by the size of the bearing, the centrifugal force will cause so much strain and wear on the ball retainer, that fracture soon occurs. Thrust bearings with ordinary pressed steel retainers, may be operated to speeds giving a centrifugal force not in excess of 8.8 lbs. A radial bearing, however, is not effected in this way and serves the purpose of a thrust bearing admirably, where the thrust is not large. In this design provision is made, for a separate drop sigh:

Fig. 5. Preston double-spindle ball bearing shaper

feed oil cup for each bearing housing. A light grade of oil, free from either acid or alkali, should be used.

Drive Pulley Provides Momentum

The drive pulley on the spindle of Fig. 2, has a certain amount of extra metal, so distributed about the shaft, as to form a flywheel. This provides sufficient momentum to carry the spindle through an extra heavy cut, such as a knot, without any appreciable drop in speed and renders the speed fluctuation in such a machine very small.

In the fourth illustration, a spindle is shown mounted on Hess-Bright rigid annular bearings and in this as well as the former cases the upper and middle bearings are merely subjected to radial loss, while the lower one takes the thrust. The same general conditions obtain when rigid bearings are used as when self-aligning are employed, so that the question of relative merit is a difficult one. The self-aligning bearings has the advantage of a ball retainer which is quite open at the sides, thus permitting a freer circulation of the lubricant around the balls than in the rigid type. The latter has a closed side retainer and at high speeds, such a retainer tends to throw the oils off again. But this is merely a matter of opinion, as the whole question of proper lubrication of vertical spindles at high speed will probably be reconsidered. It seems possible that some scheme of forced circulation with a centrifugal pump at the bottom of the shaft could be cheaply and effectively employed.

The two applications just given may be used for what might be termed medium speeds; that is up to about 8000 R.P.M. Above this speed, some arrangement similar to that illustrated in Fig. 3 should be adapted, as certain stresses, negligible at low speeds, become great enough to warrant attention when the velocity of rotation is very high. This matter, however, is too complicated to be considered here. The point to be noticed, however, in this case is that the thrust is taken on a ball at the lower end of the spindle instead of a bearing.

The pulley in this application is held on the shaft, not by a key, as in the former case, but by being pressed firmly against the shaft shoulder at the top, by the nut at the lower end, and the intervening sleeves and bearings. In this way the balance of the spindle is maintained. Where a key is used, it tends to cause vibration, as no method of balancing will completely offset the key at the R.P.M. usually employed. For the same reason an endless leather belt, shaved down to a uniform thickness, should be used on the spindle pulley. Any type of belt lace or fastener is bad, and is likely to cause trouble.

Two Typical Applications

The machines shown in Fig. 5 and 6 have both been on the market for several years and have amply demonstrated that the claims of the makers have been more than fulfilled. Fig. 5 gives a machine built by

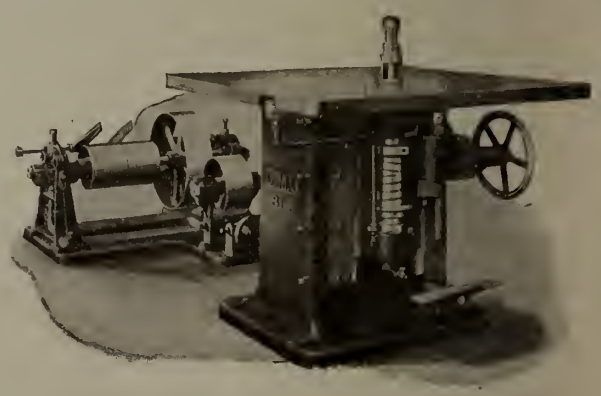

Fig. 6. C. M. C. ball bearing shaper

a company which was the pioneer in Canada in the application of ball bearings to woodworking machinery. It runs at 7000 to 8000 R.P.M., and the spindles are mounted on bearings of the self-aligning type. They are driven by spindle pulleys with sufficient metal properly distributed, to give the necessary flywheel effect. It will be noticed that these pulleys have also a spiral air groove which has proven quite effective in maintaining cool running. The shaper in Fig. 6, is very similar to the one illustrated in Fig. 5, and is also a Canadian product.

How Long-Bell Manufacture Oak Flooring

High Temperature and Humidity in Kiln—Left in Cooling Sheds 72 Hours—Conveyor Belts Help Lower Costs—Edgings Utilized for Dowels

By C. H. Murphy

During the winter months it is necessary, in order that we may properly kiln dry our lumber, to put it on stocks and let it stand on the yard for at least four months. In the summer time we can easily put it through our kilns in proper shape after it has been air-dried for ninety days.

In the loading end of our kilns we carry about 90 per cent. humidity, which we get from live steam blowing through perforated pipes. By using humidity, we thoroughly heat up and saturate the lumber before the drying process starts in. The temperature at the loading end is approximately 160 degrees. As the lumber works itself through the kiln the percentage of moisture that comes in contact with the lumber lessens, and at the discharging end we carry 175 degrees of heat and 50 per cent relative humidity. This dries the stock down to about 6 per cent. moisture content.

Low Moisture Content Not Advisable

Experience has taught us that it is not wise to kiln dry lumber below a moisture per cent of 6 per cent., for the reason that it will absorb moisture after standing in thoroughly dry sheds, to the extent of 6 per cent to 8 per cent. So if it is dried below 6 per cent., you naturally have more expansion to take care of after the flooring is worked. We operate twelve dry kilns, and it takes from seven to nine days for the lumber to go through.

The lumber is carried in the cooling sheds, and after about 72 hours it is run into flooring. We find it is necessary to hold it that long so as to prevent having what we term oversize flooring when it goes on the job, which is caused by the lumber taking on more moisture after being run, and naturally expanding.

After the lumber has been out of the kilns the proper length of time, it is sent into the factory and put through the rip saws, ripping the widths that the board will make most advantageously. From the rip saws the strips drop on a traveling chain, and the different widths are pulled in behind the proper machines. Those pieces with large defects go to the knot saws, where the defects are cut out, and the pieces laid where the side-matcher feeder can easily handle them.

Stock Matched on Milling Machines

The strips are placed in bins behind the side-matchers, where the side-matcher feeder picks them up and places them on an automatic feeding table which feeds the side-matchers. From the side-matchers the flooring, tongued and grooved, goes to the end matchers, where the defects are cut out, and the end matching done.

Our side-matcher equipment at the present time consists of three Yates machines and one Wood machine. We believe we are the only oak flooring manufacturers using the Yates milling machine, and we feel that the work done on the milling machine is far superior to anything that can be done on the old style machine. With this machine the stock is fed through edge-ways instead of bat, and it is absolutely impossible to find a knife mark. We also think that the side-matching machine on these machines is much better than can be done on the old style machine.

Conveyors Lower Handling Cost

After the stock passes through the end- matchers, it is graded and dropped into a conveyor running into the bundling room, where the stock is sorted for grade and length, each grade and length being put into a box When one bundle is accumulated it is taken out of the box, put on benches and racked up, 12 pieces to the bundle in 13/16 and ⅝ and 24 pieces to the bundle in 5/16 and ⅜. All flooring is tied with wires, and after being tied is placed on trucks and sent to the storage sheds, where each grade is kept in a separate pile.

When shipment is made, the stock is laid in the car and tallied with an adding machine. The lumber and flooring is never exposed to the weather from the time it is put into the kilns until it reaches the customer. Care is taken in selecting good roofed box cars in which to load our flooring, so as to prevent the stock being damaged by getting wet in transit. In the manufacture of flooring the utmost care is used in seeing that the stock is properly manufactured, both as to side-matching and end matching, and extreme care is used in the grading.

Complete Check on Each Operation

As you know, every piece of flooring carries our trade mark "Long-Bell Forked Leaf Brand" and each machine is numbered so that we know exactly what operator produced the flooring. Different colored crayon is used in marking the grades so that we know for a certainty which grader graded it, what unit of men bundled it, and in fact we have a check on the manufacture all the way through, and can easily tell who is responsible for flooring of excellent manufacture, as well as for any mis-manufactured or improperly graded stock.

In the factory, in addition to the flooring equipment, we operate a dowel unit, which produces about 1,500,000 dowels per month, ½-inch in diameter, 5 inches long. The dowels are made from edgings we get from the rip saw in ripping our stock to the proper widths.

Oak lumber is manufactured a little differently from pine. We have all kinds of widths to contend with, where pine is manufactured on specified widths. For example, we may get a board to the rip saw that is 5¼ inches wide, and the next one may be 10⅞ inches wide, or it may be any width up to 36 inches. The average width of the boards is about 9½ inches.

Extreme care is used in selecting lumber of a uniform color, and so the trade is assured of a very uniform color and texture in our flooring.

According to reports recently issued there are several thousand mahogany stumps in Nicaragua that could be taken out at a profit. These run from 3 to 6 feet in diameter and from 10 to 12 feet in height. The grain is very close and has a fine figure, thus making them the most desirable part of the tree for the manufacture of fancy veneers for high-grade furniture.

"What I Saw at the Canadian National"

Displays Both Interesting and Instructive—Wood Working Machinery and Equipment—Fine Work of Techical Schools—Furniture and Other Wood Products

By W. E. Clarke

With more to see, learn and enjoy than ever before the 1920 Canadian National Exhibition held in Toronto, August 26th to Sept. 11th, was, taking all things into consideration, one of the most successful exhibitions ever held in Canada. While the attendaance record set up last year was not equalled, the number of paid admissions were well over the million mark, to be exact 1,152,000.

Naturally when the editor of the "Canadian Woodworker" asked me to prepare a descriptive article, covering this stupendous affair, I gasped. One could fill a good-sized book without exhausting the material supplied by the countless, varied and interesting exhibits. However, when he explained that I was to deal with the exhibits from the viewpoint of a woodworker, covering only those of special interest to the woodworking industry, I gladly accepted.

Interesting Machinery Exhibits

Machinery Hall with its many displays of new and improved wood and iron-working equipment should have first call on the attention of the manufacturer and workman who prides himself on being up to date in his ideas and methods. Entering from the east one was confronted by the booth of the P. B. Yates Machine Co., of Hamilton, manufacturers of woodworking equipment. Here they were showing their well-known type of G2 edging and jointing saw. This machine is fitted with overhead arbor with endless feed underneath to carry the work beneath the saw. A special safety kick-back is provided to protect the operator from flying edgings and slivers. Extremely accurate work may be done on this machine. If desirable, the stock may be glued without further correcting. Another machine shown was the C3 Yates moulder. This small machine is rigidly constructed and produces smooth work at fast feels. Samples were shown of oak picture mouldings, run at 50 feet per minute. These were so smooth and well-finished that sanding or cleaning up was not required. Special heads fitted with milled cutters is the secret of this fine work. The far corner of the exhibit was taken up with a Yates No. 431 endless bed 3-drum sander. The endless bed is fitted with specially designed rubber discs which enable narrow and short stock or stock showing slight variations in thickness to be sanded to advantage. A newer machine shown was the S2 edge sander. This was only recently placed on the Canadian market. It is a very handy machine and is capable of doing accurate, smooth sanding on straight and curved edges. In addition to the fine equipment, a number of special flooring, shiplap and moulder heads were on display, such as expansion flooring heads, square and round heads, heads with milled cutters, jointing heads, etc.

The Garlock Walker Machinery Co., Limited, of Toronto, were on hand with their usual display of high-class woodworking and ironworking equipment. The woodworking machines shown included as American No. 25 straight edging and jointing saw, an American No. 2 double cut-off saw, an American knife grinder and two pattern makers sanding machines. The No. 25 edging saw is of the well-known straight edging and jointing type, that does such accurate work. It is fitted with two feed chains and four feed rolls. Very short stock can be ripped on this machine. The American No. 2 double cut-off saw is made to handle stock up to 48 in. wide and 8 ft. long. The saws are adjusted for distance by means of a hand-wheel. This is a very handy machine where there is a lot of equalizing or sizing to be done. It can also be used for ordinary ripping and mitering. The knife grinder on display was of the automatic type and was designed to handle both thick and thin knives. It produces very smooth and accurate work. The two sanders, one disc and one vertical spindle, were made by the Canadian Sander Mfg. Co., Brockville, Ont., and were specially designed for pattern makers' use. They were fitted with direct-connected electric motors, enabling them to be placed anywhere in the shop. Ironworking equipment was on display in the shape of lathes, drill presses, shapers, milling machines, grinders, precision tool-room equipment and machine tools of many kinds. One drill press that attracted a lot of attention was fitted with special chuck and cutters for making irregular holes such as square, octagon, hexagon, triangular, etc.

The A. R. Williams Machinery Co., Limited, of Toronto, occupied a space facing the western entrance. They showed both wood and ironworking machines. The woodworking equipment was represented by a Preston double spindle ball-bearing shaper and a Beach combination saw with jointing and boring attachment. The Preston shaper is of the high speed, ball-bearing type, described elsewhere in this issue. Driving the spindles at high speed not only increases production but results in a smooth, better-finished cut. This reduces the amount of sanding required to a negligible quantity. The Beach combination saw was a wood framed machine rigidly constructed for motor drive. It consisted of rip and cross-cut saw, together with a 6 in. jointer and boring attachment. A wide variety of work could be executed on a machine of this type. Ironworking equipment was shown in the usual variety, including lathes, shapers, heavy duty miller, filling machine, drill presses, etc., together with tools and equipment.

An interesting booth that attracted considerable attention was that of the Elliot Machinery Co., of Belleville, Ont. Here was displayed the well-known Elliot combination woodworker, together with a number of supplementary machines. Two combination woodworkers, together with jig saw, drum sander and planer, comprised the exhibit. The Elliot woodworker is so constructed that two men may work on it at the same time. It can be used for such operations as ripping, crosscutting, mitering, dadoing, jointing, boring and many others. The supplementary machines are belt-driven from the motor or engine on the woodworker. The planer is a new addition to the line. It is a small, compact, efficient machine having a capacity of 16 in. x 6 in. It is fitted with friction

feed and worm gear reduction, thus doing away with the usual train of gears.

Varied Displays of Equipment

The Goodyear Tire & Rubber Goods Co. were showing a complete line of mechanical rubber goods and conveyor and transmission belting, including their well-known "Klingtite" brand (formerly "Extra Power") of transmission belting. The mechanical rubber goods consisted of steam, water and air hose, together with packing of all description and other similar products.

The Dodge Mfg. Co. of Canada, Limited, Toronto, Ont., made an attractive display, consisting of their line of transmission equipment, including such items as pulleys in wood, iron and pressed steel friction clutches, hangers and boxes, couplings and collars, transmission ropes, gearings and other forms of transmission equipment.

Two new features were included in the exhibit of the Bond Engineering Works, Limited, Toronto. One was the Bond loose ball bearing counter-shaft and the other a new Bond patent single adjustment friction clutch. In the ball bearing counter-shaft the shaft remains stationery, the idling and driving pulleys being mounted on S.K.F. ball bearings. The advantages claimed for this counter-shaft are a saving in power, freedom from vibration and bearing trouble, and the use of a lighter countr-shaft. The single adjustment clutch is so constructed that the different shoes may be adjusted singly or as a unit. Another feature is that the shoes may be removed and replaced without dismantling the whole clutch. Other articles on display included Bond hangers, pillow blocks, spiro and plate couplings, etc.

The Acme Steel Goods Co. of Canada, Limited, Montreal, in their display were showing a line of corrugated fasteners, both plain and divergent, the latter pulling the pieces together with a draw. Box-strapping and box and pail fasteners of different kinds, together with bale ties, etc., were also shown.

Attracted Large Crowds

One other demonstration held in this building which, while not connected with the woodworking industry, was of sufficient general interest to warrant a little space, was the cutting of steel by the oxy-acetylene method. Large steel plates, 1 in. in thickness, were cut in various shapes with blow torches. The work was done as neatly and smoothly as if it had been cut on a band saw from a 1 in. board. The cutting was carried out at a speed of about 2 ft. a minute, the flame making a clean cut, leaving a kerf or groove about ⅛ in. wide. By the use of a pantagraph arrangement, various designs could be worked out in the steel. It is needless to say a large crowd gathered whenever any cutting was being done.

The displays of the work of the different technical schools, shown in the Government Building, attracted my attention in my role of woodworker. The examples, on view, not only included the usual simple elementary models so common to manual training work but included many examples of fine furniture and other more pretentious articles, which showed a fair amount of skill on the part of the pupils, both in execution and in design. This display should tend to disprove the oft-heard statement that technical schools merely give a smattering of practical knowledge. If a pupil can construct an oak buffet or table or winding stair or make a beautiful carved taboret or chest having a well-matched, figured veneered top, he has acquired practical knowledge that should stand him in good stead in any factory. The technical and other similar schools should receive the whole-hearted support of every employer of skilled labor. Without institutions of this kind it is a question where the skilled mechanics of the next generation would come from.

An attractive showing of B. C. forest products was to be found in this same building. This was in charge of the newly-appointed British Columbia Lumber Commissioner for the east, Loren L. Brown. The display included samples of the different commercial woods of that province in various finishes, also samples of numerous products made from B. C. woods. Several pieces of furniture were on display, simply to show the variety of uses to which these woods might be adapted. One set, consisting of library table and upholstered chair, that attracted considerable attention was made of B. C. fir and finished in a dark driftwood effect, known as "Sugi" finish. Two fine examples of B. C. timber proved of general interest. One was a piece of clear fir 3 in. by 15 in. by 32 ft. and the other a clear Sitka spruce deal 3½ in. x 12 in. by 30 ft. The booth itself was nicely panelled in B. C. woods, making an attractive and educational display.

Hollerith Sorter Received With Interest

A stroll through the Process Building revealed the exhibit of the International Business Machines, Limited, of Toronto. This consisted of a wide range of time-recording and time-keeping clocks in different sizes and designs for different uses. Some were entirely automatic, changing at specified times from "in" to "out," also from shift to shift. The Hollerith electric tabulator and the Hollerith automatic sorter, were the subjects of unusual attention. With these machines a vast amount of valuable information is recorded on cards by a system of holes. These cards, when passed through the sorter, may be sorted to bring out any information required. After sorting, the cards could be passed through the tabulator, which would give various totals, covering the desired information. These machines are designed specially for cost-finding and keeping and figuring pay rolls.

Another exhibit of interest in this building was that of the Flint Varnish & Color Co. This was included within the display of the parent organization, the Canadian Explosives, Limited, of Montreal. The showing consisted of practically the full line of their well-known Flint varnishes and colors, including stains, enamels, dyes, fillers, varnishes, etc. The display was tastefully arranged and showed the line to good advantage.

Many Showings of Wood Products

Another phase of the exhibition that interested me in my role of woodworker was the displays of the manufactured wood products made by woodworkers themselves. The space at my disposal is too limited to attempt to describe in detail or even list these exhibits. Several well-known furniture manufacturers were showing lines of upholstered furniture and davenports. The same holds true of the number of makers of kitchen cabinets and refrigerators. Cedar chests were found in several booths while toys and woodenware were on display in others. Portable or sectional houses and garages were represented by several exhibits. Through standardization and the use of templets the sections of these structures are built so that the bolt-holes come together, thus making for easy and quick assembling. This one feature alone is doing a lot to increase the demand for sectional buildings.

General view of plant of Trenton Cooperage Mills, Limited, Trenton, Ont.

Would Reach from Toronto to Vancouver

Huge Quantity of Staves Manufactured by Trenton Plant—Production Costs Lowered by Labor-Saving Installations—Description of Manufacturing Operations

Little is written or heard about the manufacture of cooperage stock, yet this is a large and important branch of the Canadian woodworking industry. A number of large plants, employing many hundreds of men, are equipped for the quantity production of staves, hoops and heading. The size of the branch

W. A. Fraser, manager and proprietor of the Trenton Cooperage Mills, Limited, Trenton, Ont.

of the woodworking industry can best be judged by the value of its products which in 1919 ran from $4,000,000 to $5,000,000.

One of the larger of our cooperage plants is that of the Trenton Cooperage Mills, Limited, Trenton, Ont. This plant has a daily output of 45,000 staves, 30,000 hoops, 3000 sets of heading and 500 barrels. Figured in annual output, this would run approximately 5,000,000 to 6,000,000 staves, 3,000,000 hoops, 250,000 sets of heading and 120,000 barrels. In addition about 500,000 ft. of lumber is cut and disposed of each year. Some idea of the amount of stock produced may be gathered from the fact that if the 6,000,000 staves produced yearly were to be placed end to end they would form a continuous line which would reach from Toronto to Vancouver, B. C. The total amount of timber worked up annually is in the neighborhood of 2,500,000 ft.

The wood used is largely elm. Smaller amounts of pine, poplar and basswood are worked into heading stock and also made into sawn staves. It has been found that elm is admirably suited for the manufacture of coiled hoops, in fact, to date, a satisfactory substitute for this wood has not been found, and makes a good cut or sliced stave, so that naturally it is preferred by most manufacturers of cooperage stock. The clear, straight-grained material is made into hoops and the balance worked up into staves. Some of the American plants are using red gum for cutting staves, and while this makes a good stave, it is not at all suitable for hoops.

The raw material in the shape of elm, pine, poplar and basswood logs is purchased in the open market, largely from the farmers and owners of small timber tracts, and in addition a fair proportion comes from the company's own holdings in North Hastings. About six camps were operated last year in these limits. The mill at Trenton enjoys an almost ideal location as it has trackage and deep water frontage. This enables logs to be brought in from the surrounding county by both rail and water and also assists in the distribution of the finished product. Trenton itself is the hub of a network of railways. The C. P. R., G. T. R. and C. N. R. run through the town and in addition a number of smaller local lines serve the adjoining districts.

Efficient Handling of Material

The logs are all lumped in the booms and fed to the log haul-up. At the present time there are about 1,000,000 ft. of material in the water and on the bank. At the head of the log haul is a power drag saw. Here the clear stock for the hoops is picked out and bolted to length. This is sawn into 1½ in. plank. The balance of the logs are cut into planks and squares for staves. The sawyer must follow the grain closely for the staves must be sliced so as to show the edge-grain. The pieces drop from the rotary saw on to live rolls which carry them to a large trim-saw. This saw cuts the stock into bolt lengths.

These bolts, together with the hoop plank, drop on to a chain conveyor and are carried to the steaming and boiling vats. The hoop stock is piled in large, open tanks and boiled, while the stave material is placed in close retorts and subjected to steam for about twelve hours. The temperature and dryness of the steam is varied according to the condition of the wood. When the material is green and full of sap and moisture, a dryer steam is used.

The accompanying rough sketch will give an idea

of how handling is reduced to a minimum and production speeded up. The material is carried past the trim saw on live rolls, then drops on the endless chain conveyors which carry it to the tanks and steaming chambers. The long hoop stock is laid out on a wide table and then piled into the vats, while the stave material is picked right off the conveyor and placed in the steaming retorts.

Slicing Staves and Bolts

Each chamber holds about 2½ cords of material. About 25 cords of staved wood constitutes a day's cut for the slicer. This amount would about fill 10 retorts. As 12 retorts are provided, there is always one or more empty. Thus the men are filling an empty chamber at one side while on the other side a number of men are unloading another one. As the bolts are taken from the steaming chamber, they are piled on trucks and peeled. The bark comes off very readily when the wood is hot. The loaded trucks are run to the equalizing saws, which consist of two saws mounted on one arbor, together with cradle, where the bolts are cut to the exact length required. The saw operator piles the sized stock on a small table, which is within reach of the operator of the stave cutter. In this way excessive handling and lost motion has been to a large extent eliminated.

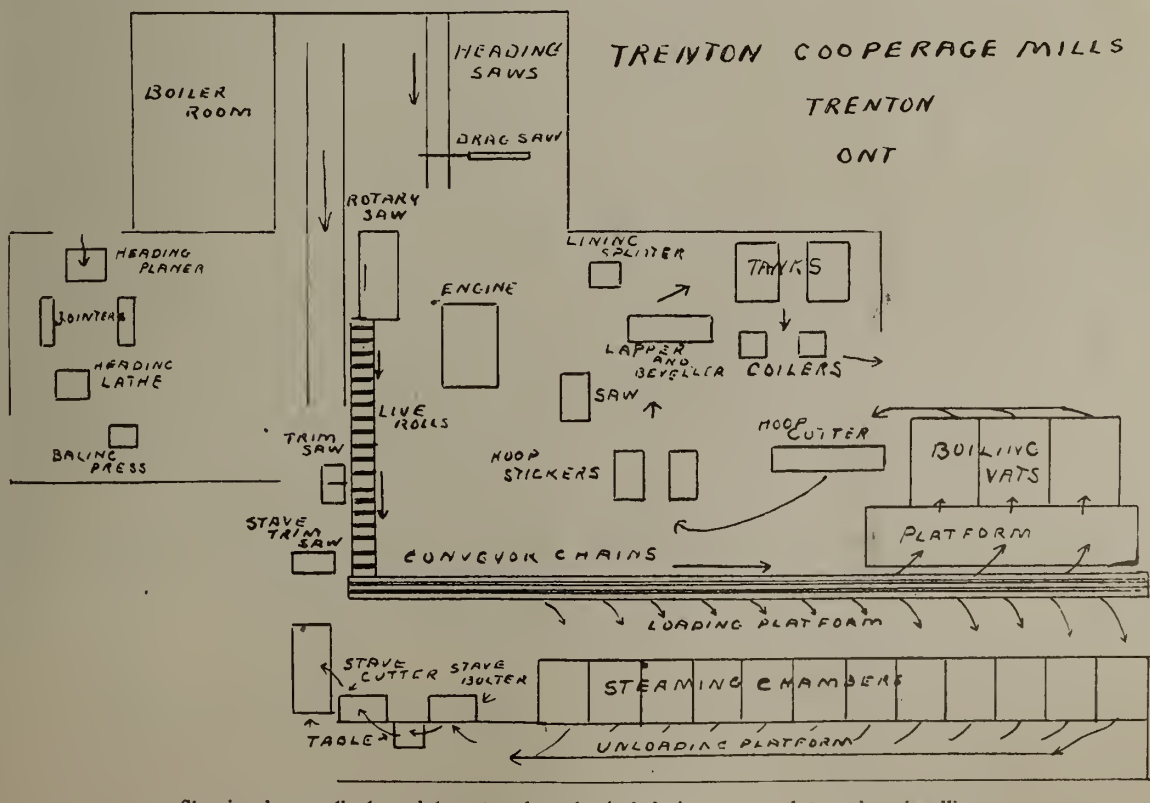
The staves are sliced on a large knife which works them to the radius of a 20 in. circle. This radius may be varied to suit the requirements of different sized barrels. With this machine one man can cut about 45,000 staves in a day's run, but to do this he does not lose very much time. A helper working behind the stave slicer sorts the staves as they are cut. The good ones are loaded on wagons and taken to the drying shed, while any that will make shorter staves, such as those required for kegs, are passed to a trim saw where they are brought to length. The very narrow pieces and the cull material go to the furnace room. It is not all burned, however, as the best is picked out and shipped to an American glass manufacturer who uses it for making crates. The stave cutter must be quick and must use good judgment as he is required to turn his material so that the staves will show an edge-grain. If cut on the flat there is a great tendency to warp and in addition they flatten out instead of retaining the curve.

Staves Air Dried in Large Sheds

The cut staves are hauled away to the drying shed and yards which embrace about 10 acres. Here they are piled so that the air will circulate freely. If the circulation is not good, there is a tendency for mildew to form. About 40 days is sufficient to remove all surplus moisture, though the time varies depending largely on the weather conditions. When dry, they are joined on foot jointers to the bilge required by the coopers and then packed in bundles. If the staves are required bevelled and crozed for the heading, they are run through an automatic machine which trims, bevels and crozes both ends This is usually done before they are joined to bilge. The stock is now ready for assembling or shipping.

The hoop material follows a different route. After being removed from the chain conveyor, the hoop stock is placed in large tanks where it is boiled. It then goes to the slicer, which cuts it into thin strips. These strips are made thin on one edge. To secure this taper, the plank is tilted automatically at every second cut. The hoop strips are run through a special sticker which dresses the two edges and rounds the outside corners. These machines are designed so that two pieces may be run through at a time.

The strips are now passed through an automatic machine which trims them to length, points one end and bevels the other end for the lap. They are next



Showing how well planned layout and mechanical devices are used to reduce handling

placed in tanks and boiled and then coiled on special machines. The hoops are made up in coils or rolls containing 10 hoops. These coils are piled in the yard and air-dried. Before being placed on the barrels, the hoops are again dampened. The boiling and subsequent air-drying tends to make the stock tough, strong and pliable.

Heading Made in Separate Department.

The heading material is bolted to short lengths, cut into ½ in. pieces on a swing cradle saw and then either air or kiln-dried. The dry material is taken to the heading mill where it is planed on one side, both edges jointed and then cut to shape on a machine which, if necessary, bevels both edges so as to fit the crozers in the barrel staves. The heading is placed in a press and wired in bundles containing 40 pieces or 20 sets.

In assembling, the staves are set up with temporary hoops known as "tresses," and placed over a barrel heater. The heat tends to dry out any moisture which might remain in the stave and also sets the stave in the shape of the bilge. If the staves used have not been bevelled and crozed, a special machine trims, bevels and crozes the whole end of the barrel. Permanent hoops are now forced on and the bottoms put in place which completes the assembling operations.

Both steam and electric power are employed. At one time a large motor was used to drive the rotary saw employed in breaking out the logs. It was found that this was not satisfactory, as there was not sufficient momentum or weight to maintain the speed when a long, heavy cut was encountered. A steam engine was installed to replace this motor and an adequate supply of power insured. The group drive is used in the motor installations. Thus, if an accident occurs to the transmission of any one department, it does not necessitate stopping the whole plant. One motor drives the hoop-making group, another the stave-cutting machines and a third the heading equipment, etc. Steam for the engine, vats and retorts is generated in two boilers. The fuel is sawdust, bark from the stave bolts and part of the cull staves. This leaves the trimmer blocks and slabwood to be disposed of for domestic fuel. The sale of this wood brings in a considerable amount of revenue. The sawdust and refuse from the saws is fed to one furnace by a chain conveyor. This material accumulates in sufficient quantities to keep this furnace going as long as the plant is in operation.

The Trenton Cooperage Mills was formerly operated by the Atlantic Sugar Refineries, Limited, but was taken over in 1918 by Messrs. Fraser & James, who operated under the name of the Trenton Cooperage Mills, Limited. Mr. W. A. Fraser recently acquired the interests of his partner and is now sole proprietor of this progressive concern.

The Sample Board Method of Testing Lumber

Simple Way of Figuring Moisture Content—Saves Necessity of Drying Sample Every Time Test is Made—Quick and Fairly Accurate

By J. B. Maas*

I is perhaps needless to say, with the present high costs of lumber, that in drying this stock it must be brought through the drying process in the best, easiest and quickest manner, for the modern idea of efficiency is "to arrive at some desirable end, you must do it by the best, easiest and quickest way." This definition most surely applies to drying lumber under the present conditions. The stock must be in the best condition; it must come out in the quickest time, and it must be put through in the easiest way.

The figure "3" seems to be related in some way to a dry kiln, for, in drying lumber properly, we have three principles that are fundamental. The three, when found together, put any kiln under absolute control, but with one of these missing, the other two are of little value. These three are :Ample heat or radiation, direct circulation and a method of controlling humidity. You can readiiy see, if heat and humidity are present, but circulation is absent, the result attained is practically nil. The same result will be attained if either of the other two principles is lacking.

It is the purpose, in this article, to take for granted that the operator does have the three factors mentioned above, and consequently will be able to follow consistently any good drying process which may be prescribed.

Simplifying the Operations

Every technical process seems mysterious to some people and extremely simple to others. I have noticed that the expert operator of any sort of machinery or apparatus invariably reduces his methods to the simplest terms. He seldom indulges in all of the phases of scientific research and data regarding the subject with which he may be dealing. On the other hand, by long practice and great familiarity with his work, he has reduced his operations to a few simple moves.

The drying of lumber offers great opportunities for a similar treatment on the part of the operator.

A great amount of knowledge regarding forestry and timber physics is undoubtedly worth while. Such knowledge increases the value of the operator's judgment and makes it easier for him to know his work. However, with or without such knowledge it is possible to reduce the proposition of kiln drying to a simple basis by what is known as "The Sample Method."

Selecting and Marking Samples

Now, in drying lumber, if you know at all times just the percentage of moisture present, half the battle of drying is over, for then it is but a question of using common sense to apply these principles. For example, in drying a charge of lumber, the practice consists of selecting two or three sample boards that are an average of those to be dried; then bring them to the cut-off saw; saw off one foot or so from one end and discard this piece. Now cut a cross section piece, about ¾ in. to 1 in. thick and mark it in this manner: K4T1SA. The significance of this symbol would be as follows.

Kiln 4	Truck 1	Left side (A side)
K4	T1	S.

K4T1SA

(The operator can use any other system of marking which will enable him to maintain the identity of the pieces).

The next cut on the board will be a piece two feet

*National Dry Kiln Co., Indianapolis.

long, which is marked the same as the one-inch disc. From another board repeat the process, marking each piece according to the place in the kiln it is go. For instance, the next piece may be K4T6B. Have some system of marking. I generally put the two-foot pieces marked "A" on the left side of its respective truck and those marked "B" on the right side. Use as many samples as you want. I generally find four to six in a kiln is sufficient, if they are representative pieces.

Weigh Disc and Sample

Now, weigh these discs up on a gram scale and mark the green weight on the chart headed "Green Weight of Disc," then place on heater to dry. Next paint the freshly cut ends of the two-foot pieces with a graphite paint, mixed with rosin. This is to keep the piece from drying out through the ends.

Weigh these pieces on a scale graduated to pounds and 1/100 of a pound, and record the weights on your chart, under heading "Green Weight of Sample." This done, place your two-foot samples in their respective trucks, about two-thirds the distance up the pile.

When the discs that are on the heater are thoroughly dry (that is, when they lose no more weight), weigh them again and mark this weight on chart under heading "Dry Weight of Disc." Now, by subtracting the dry weight of disc from the green weight of disc and dividing by green weight, we have the percentage of moisture, based on bone dry weight, but was present in the piece originally.

Example:

Green weight of sample ... ... 82 grams
Bone dry weight of sample ... ... 66 grams
Evident weight of moisture ... ...22 grams
22 grams ÷ 66 grams = 33-1/3 moisture content.

That is moisture content figured on percentage over bone dry.

Calculating Final Weight

Further, by assuming the wood itself to be unity, or one, and everything over that to be the percentage of moisture, we can readily figure out the weight that the two-foot sample will be when it is absolutely dry. This can be done by dividing the weight under heading "Weight of Green Sample" by one plus the percentage of moisture found in the green disc. This result is then marked under heading "Calculated Dry Weight of Sample."

Example:

Gross weight of sample . ...8 pounds
Eight pounds ÷ 1.33-1/3 = 6 pounds, or bone dry weight of sample

At this time the operator can also make calculation as to the future weight of samples when they are as dry as desired.

For instance, if it is desired to dry down to 5 per cent., the final weight of the above sample will be 6 pounds + 5 per cent. (4.8 oz.) = 6 pounds 4.8 oz.

With this result found in each different piece, the rate of drying or the current percentage of moisture at any time can be known by simply taking the two-foot samples from the kiln, weighing each individually and jotting down its current weight. When this is accomplished, replace samples in kiln again and subtract the calculated dry weight(as noted on chart) from the present weight of sample, and divide this by calculated weight, and the result will be the current moisture per cent. of lumber in kiln.

Application of Method

The following is an example of using the sample method of drying. In the first column we have the kiln and sample number. Taking K4T1A, for instance, this means Kiln No. 4, Track No. 1, A or left side of pile.

In the next column we see 44.40 grams, or the weight of green 1 in. disc. Adjoining this we see 36,20 grams, or the weight of the disc after being thoroughly dried. Now by subtracting 36.20 grams from 44.40 grams, we get an answer of 8.20 grams. Now, by dividing this by 36.20 grams we get 22.6 or the percentage of moisture that was in the disc originally.

In the next column, headed "Weight of green sample," we find 4.43—or this is the weight in pounds of the two-foot piece on the scale. The calculation oven dry weight of sample is secured by dividing 4.43 by 1 plus 22.6 per cent., or, figuring to nearest unit, 1 plus 23 per cent. The 1 is the unit of the wood itself and the 23 is tthe excess weight due to moisture. The result of dividing 4.43 by 1.23 gives us an answer of 3.60, or the weight of the two-foot piece when it is bone dry.

Now, supposing after ten days' drying the sample was taken out, and, after weighing, was found to be 4.00 pounds exactly. Then, by subtracting the calculated oven dry weight from the present weight, we get 40, and then by dividing this by 3.60 we get 11 as an answer, and this means at this exact time we have 11 per cent moisture in the sample. Suppose a few days later the sample weighed 3.80 pounds; then, by dividing by 3.60, we find the then present moisture to be 5.5 per cent.

Oak Barrel Not Strong Enough

The barrel in which the ill-fated Bristol barber, C. G. Stephens, unsuccessfully attempted to shoot Niagara Falls, was made byRoberts & Son, of Tottenham, Eng. This huge barrel was 6 feet high, 2 2inches heads and 32 inches in bulge. It was built of 10 years seasoned English oak, with convex heads to withstand external pressure of concussion. The barrel is bound by many massive hoops. The manhole frame and cover are similar to that used on large steam boilers, with bridge screwed down to tighten the joint. The opening is 18 inches by 12 inches. The air space would permit a man living only about 12 minutes, so a special breathing apparatus was installed to provide a supply of oxygen and purify the air.

That the attempt was unsuccessful is past history. The barrel was not strong enough to withstand the tremendous strains and pressure. One of the iron bands snapped shortly after it was placed in the water, probably due to the swelling of the wood. After the barrel containing Stephens went over the Falls it was never seen again, only a few fragments being picked up.

Sample Number	Weight Green Disc	Weight Dry Disc	Per Cent of Moisture	Weight Green Sample	Calculated Oven Dry Wt. of Sample	Current Date 4-20	Moisture 4-24	Pert Cen 4-30
K4T1A	44 gm.	36.20 gm.	22.6	4.43	3.60	11	5.5	
K4T3B								
K4T6B								

Illustrating how sample method is used

Distribution of Canadian Hardwoods

Stands of Different Woods Defined--Birch Most Important Native Wood—Conservation and Protection of Timber Resources—Greater Utilization of Waste

By R. G. Lewis*

Canadian manufacturers, using wood as a raw material, are no doubt well aware of the limited supply in Canada of such woods as hickory, oak, walnut, and cherry and they probably have a very good idea of the extent of the supply of the more common and more plentiful hardwoods, such as birch, beech, and maple; but it might be of interest to many manufacturers to outline the natural distribution in Canada of the more important hardwoods. In the first place it might be well to remind you of the fact that there are no woods of commercial importance found in Canada and not found in the United States. In most cases the supply in the United States of those woods which are common to both countries exceeds the supply in Canada.

On account of the rigors of the climate in the extreme northern part of Canada tree growth of all kinds comes to an end long before we reach the shores of the Arctic Ocean. The extreme limit of tree growth may be roughly indicated by a line drawn from the the mouth of the Mackenzie River, southeast to the mouth of the Churchill River on the Hudson's Bay and following the shores of the bay so as to include the greater part of the peninsula of Labrador. South of this line the treegrowth is represented by spruce, balsam, tamarack, poplar and jackpine; at first stunted and distorted by the extreme climatic conditions. Further south improving and developing into heavier stands which ultimately form the vast pulpwood resources of the Dominion in the East, and the local supply of saw timber in the northern parts of the Prairie Provincecs. The only hardwood which might be of interest to the wood turning industry in this type is the paper or canoe birch. This tree is abundant throughout Canada but only reaches commercial sizes on the most favorable sites. The popular species are also present and may in time become commercially important although they are at present looked on as tree weeds and are used only for firewood, rough construction and for wood pulp.

As we approach and cross the height of land dividing the waters of the St. Lawrence River from those of Hudson's Bay, we find a different type of forest. The white and red pines, the hemlock and cedar become important constituents of the forests and the more valuable hardwoods appear in turn as we proceed southward.

Commercial Hardwoods Confined to Southern Parts

It should be understood that the hardwoods of Canada are largely confined to the southern parts of the province of Ontario and Quebec and to the Maritime provinces south of the St. Lawrence River. West of the province of Ontario the commercially important hardwoods are almost entirely lacking from the existing forests. North of the Prairie Provinces the only deciduous trees are the poplars and birches. In the province of British Columbia, the forests are also almost entirely coniferous. There is a Pacific Coast oak, a birch and a maple which are sometimes sawn into lumber, but they do not occur in commercial quantities.

*Forestry Statistician, Ottawa.

We may therefore confine our attention to the Eastern provinces and commencing at the north we find the black ash and white elm the first important hardwoods to appear. These two trees are not found in quantity north of the Transcontinental Railway in Northern Ontario. In Quebec the northern limit of the black ash extends through the northern part of the province until it reaches the Gulf of St. Lawrence at Anticosti Island. The white elm in Quebec is not found north of the height of land. Both trees are found in the Maritime Provinces.

Birch Most Important Hardwood

The yellow birch which is Canada's most important hardwood at the present time and is more limited in its distribution than either of the preceeding species. It is not found in quantity west of Lake Superior. From this lake to the east its northern limits extends to Lake St. John in Quebec and also reaches the Gulf of St. Lawrence at Anticosti Island.

While the maple leaf is Canada's national emblem, the maple is not our most important hardwood. There are three species of maple of commercial importance in Canada, the hard or sugar maple and the two soft maples commonly called the white or silver and the red. The hard maple and the red maple are not found extensively north of Lake Superior in Ontario nor Lake St. John in Quebec. The white or silver maple is still more limited in its distribution, but is not so important commercially as the other two species

There are a dozen or more oak species in Canada, the most important of which is the red oak. This tree follows the same distribution in a general way as the yellow birch and the hard and red maples. The white maple, the beech, the white ash, the basswood, and the white oak are not found north of Sault Ste. Marie in Ontario nor the city of Quebec in Quebec Province. There are six hickory species in Canada, the most widely distributed being the butternut hickory which is found as far north as a line drawn from the neighborhood of Parry Sound through Central Ontario and Quebec to Three Rivers in the latter province. The hickories are unknown in the Maritime Provinces.

Butternut follows the same distribution in Ontario and Quebec but reappears in southern New Brunswick. Black walnut and sycamore are confined to the western peninsula of Ontario, and a narrow strip of territory along the north shore of Lake Ontario, and found elsewhere in Canada. The tulip or yellow poplar, the sassafras, and the chestnut are found only in the southern part of this western peninsula of Ontario, chiefly along the north shore of Lake Erie.

Have Limited Distribution

From these remarks it will be seen that the distribution of hardwoods in Canada is very limited. The extensive hardwood forest which covers the central eastern states, extends northward, across the border into Canada, but as it extends it loses tree after tree as the climate becomes more and more severe until the black ash, the poplars, and the paper birch, alone

(Continued on page 114)

Standard Specifications for Nailed and Lock Corner Boxes

Specifications of National Association of Box Manufacturers Endorsed by Society for Testing Materials—Specifications Canned Goods Cases Revised

Standard specifications for wood boxes has been the aim of the National Association of Box Manufacturers through their specification committee. This committee has been endeavoring to develop standard specifications that could be applied to boxes for different commodities. After much labor these specifications have been completed, except for two clauses, namely, a specific rule for outlining allowable defects in lumber and a general rule dealing with the reinforcing of boxes by attaching metal strapping, and have been approved by the association. The American Society for Testing Materials has endorsed these specifications:

This society at its recent convention in Asbury Park, N. J., adopted tentative standard specifications for wooden boxes (nailed and lock-corner construction), together with specific specifications for canned foods cases. These specifications are printed below.

The American Society for Testing Materials is an association of corporations and individuals, interested in industrial science and chemistry, formed for the promotion of knowledge of the materials of engineering and the standardization of specifications and the methods of testing. The society functions in creating its standards for shipping containers through its Committee D-10, of which John A. Newlin and T. R. C. Wilson of the Forest Products laboratory, Madison, Wis., are the chairman and secretary, respectively. The committee is made up of those who are engaged in various lines of research study on packing box construction, and of those who are most active in encouraging the work of standardization.

The following report of Committee D-10 was presented to the members of the society at their last meeting and was adopted as tentative standard for the society. A year hence these specifications will be voted upon and if then approved, will become permanent either in their present form or as modified.

Proposed tentative general specifications for wooden boxes, nailed and lock-corner construction.

These specifications are issued under the fixed designation D....; the final number indicates the year of original issue, or in the case of revision, the year of last revision.

Issued, 1920.

1. Types of Boxes Covered. These specifications are intended to apply to wooden boxes of nailed and lock-corner construction, and are directly applicable to all the styles of boxes.

1. Material

2. Seasoning. The lumber shall be thoroughly seasoned, that is, shall have an average moisture content of 12 to 18 per cent., based on the weight of the wood after oven-drying to a constant weight.

3. Defects. All defects in the lumber that materially lessen the strength of the part, expose contents to damage, or interfere with proper nailing, shall be eliminated.

4. Manufacture. Ends, sides, tops, bottoms and other parts of a box shall be well manufactured and cut true to size.

II. Grouping of Woods

5. Grouping of Woods. The principal woods used for boxes are classed for the purpose of specifications into four groups, as follows:

Group 1. White pine, Norway pine, aspen (popple), spruce, western (yellow) pine, cottonwood, yellow poplar, balsam fir, chestnut, sugar pine, cypress, basswood, willow, noble fir, magnolia, buckeye, white fir, cedar, redwood, butternut, cucumber, Alpine fir, lodgepole, jack pine.

Group II. Southern yellow pine, hemlock, North Carolina pine, Douglas fir, larch (tamarack).

Group III. White elm, red gum, sycamore, pumpkin ash, black ash, black gum, tupelo, maple, soft or silver.

Group IV. Hard maple, beech, oak, hackberry, birch, rock elm, white ash, hickory.

III. Dimensions of Parts

6. Thickness of Parts. (a) The thicknesses called for in specifications for boxes of any given commodity will, unless otherwise specified, be understood as applying to woods of Groups I. and II.

(b) When the material is specified (for Group I. and II. woods) of the thicknesses indicated in the following table, woods of Groups III. and IV. may be used with the following permissible reductions in thickness:

Specified Thickness of Parts (Group I and II Woods)	Allowable Reduction in Thickness if Group III and IV Woods Are Used
5/16 to ½ in. incl	1/16 in.
Over ½ tto 1 in., incl	⅛ in.
Over 1 to 2 in., incl	¼ in.

7. Permissible Variation in Thickness of Parts. The permissible variation below the thickness of parts specified in Section 6 shall not exceed one-eighth of the thickness of the part.

8. Width of Parts. (a) The maximum number of pieces allowed in any side, top, bottom or end of a box shall be as follows.

Width of Face	Maximum Number of Pieces
5 in. or under	1
Over 5 to 8 in., incl	2
Over 8 to 12 in., incl	3
Over 12 to 20 in., incl	4
For each additional 5 in. in width of face	1 additional piece may be used

(b) Two or more pieces Linderman-jointed shall be considered as one piece. No piece less than 2½ in. in width at either end may be used in any part, except for cleats or battens.

9. Surfacing of Boxes. The outside surfaces of boxes shall be sufficiently smooth to permit of legible marking.

10. Joining. (a) Ends 1 in. or less in thickness, if made of two or more pieces, shall be either (1) butt

jointed or matched and fastened with two or more corrugated fasteners; or (2) cleated.

(b) The size of corrugated fasteners to be used shall be as follows:

Thickness at Ends	Size of Corrugated Fasteners
7/16 in.	1 by 3/8 in.
3/4, 13/16 and 7/8 in.	1 by 5/8 in.
5/8 in.	1 by 1/2 in.

Schedule of Nailing

11. Kinds of Nails. (a) All nails specified in these specifications are standard coment-coated box nails.

(b) If other than cement-coated nails are used, 25 per cent. more nails shall be driven than specified for cement-coated nails. Plain nails driven through and clinched may be used for cleating.

12. Size of Nails. The size of nails to be used is determined by the species and thickness of the material in which the points of the nails are held, and shall be in accordance with the following table:

Size of Cement-Coated Nails for Different Species and Thickness of Material.

(The sizes of nails are given in "penny.")

Note: If the designated penny of nail is not available, the next lower penny shall be usesd, and the nails spaced proportionately closer.

13. Spacing and Number of Nails. (a) The spacing of nails holding the side, top or bottom to the ends of a box shall be as follows:

Sizes of Nails, "Penny"	Space When Driven Into Side Grain of End	Space When Driven Into End Grain of End
6 or less	2 in.	1¾ in.
7	2¼ in.	2 in.
8	2½ in.	2¼ in.
9	2¾ in.	2½ in.
10	3 in.	2¾ in.

(In order to ascertain the number of nails to be used, divide the width of the side, top or bottom [or length of cleat] by the spacing specified for the size of nails to be used. Fractions in the result greater than ¼ if the points of nails are to be held in the end grain, and greater than ½ if the points of nails are to be held in the side grain, will be considered as a whole number.)

(b) The spacing of nails holding the top and bottom to the sides of a box shall be 6 to 8 in. When material in the sides is less than ½ in. in thickness, side nailing shall not be used unless otherwise specified.

(c) No board shall have less than two nails at each nailing end. Where cleats of thickness not less than the thickness of the ends are used, approximately 50 per cent. of the nails shall be driven into the cleats.

14. Driving of Nails. Nails shall be driven flush.

(Overdriving of nails materially weakens the container.)

15. Strapping. Specifications to be supplied by the committee when the information is available.

Specifications for Canned Goods Boxes

Proposed revised tentative specifications for wooden boxes, nailed and lock-corner construction, for the shipment of canned goods.

Serial Designation: D 44—20 T.

These specifications are issued under the fixed designation D 44; the final number indicates the year of original issue, or in the case of revision, the year of the last revision.

Canned Foods Boxes. Issued, 1917; revised, 1920.

Wooden boxes of nailed and lock-corner construction for the shipment of canned foods shall comply with the tentative general specifications for wooden boxes, nailed and lock-corner construction (Serial Designation: D.... ..20 T) of the American Society for Testing Materials, except as otherwise provided in the table below:

Commodity	Type of Box Construction	Minimum Thickness of Material in Top and Ends	Sides†	Bottom†	Maximum Gross Weight of Box and Contents, lb	Permissible Variations in Inside Dimensions of Boxes
Canned Foods in Metal Cans (Fish, Meats, Fruits, Vegetables and Other Foods)	Nailed	5/8	5/16	5/16	90	Inside dimensions of boxes shall not exceed the exact length and width of contents by more than ¼ in., nor the exact depth of contents by more than 1/8 in.
	Lock-Corner	7/16	7/16	5/16	50	
		½	5/16	5/16	50	
		5/8	5/16	5/16	90	

*The thickness specified apply to boxes of Group I, II and III woods. When woods in Group IV are used the thicknesses may be 1/16 in. less than those specified.

†When one-piece sides and two-tops and bottoms of woods of Groups I and II are used, materially may be 1/32 in. thinner than specified. When rotary-cut gum lumber is used in one-piece sides and tops and not more than two-piece bottoms, the thickness may be 1/16 in. less than specified for woods of Group III, minimum thickness ¼ in.

Species of Wood Holding Nails	Thickness of Ends or Cleats to Which Sides Tops and Bottoms are nailed, in								Thickness of Sides to Which Top and Bottom Are Nailed, in		
	3/8. or less	7/16	½	9/16	5/8	11/16 or ¾	13/16	7/8	Less than ½	½ to 9/16	5/8 to 7/8
Group I woods	4	5	5	6	7	8	8	8	4	6	7
Group II woods	4	4	5	5	6	7	7	8	4	5	6
Group III woods	3	4	4	5	5	6	7	7	3	4	5
Group IV woods	3	3	4	4	4	5	6	7	3	4	5

Cost Figures on Cigar Boxes

At a meeting of the National Cigar Box Manufacturers' Association, held in New York recently, it was suggested that a national cost sheet be adopted by all the member manufacturers. From the cost figures presented the average cost of producing cigar boxes per thousand was computed as shown on the following itemized list:

Cigar Box Cost Sheet

Amount of lumber used in cutting up 1000 boxes; 1250' including waste.

Average Cost of Labor

Sawing and sorting	$ 4.90
Wood printing, 3 M Imp	1.62
Nailing	2.59
Sanding	1.29
Trimming	.97
Hinging	1.40
Pulling nails and cleaning	.99
Lining and cutting labels	.77
Pasting and papering	17.31
Glue machine operator	.89
Packing for delivery	1.61
Delivery	1.28
Foreman	2.48
Utilities	4.36
	$42.46

Material per 1000 Boxes

Ink	$ .14
Nails	1.03
Sandpaper	.11
Hinge cloth	1.14
Glue for labels and hinges	.80
Edging	4.20
Lining paper	1.83
Flaps and top sheets	.81
Paste	.59
Twine	.62
Paper wrapping	.44
Fibre boxes	3.81
	$15.52

Overhead per 1000 Boxes

Salaries	$10.11
Depreciation	1.22
Bad debts	.22
Travelling expenses	1.06
Dis. and Exchange, Dis. .06, Ex. .06	2.70
Insurance	1.29
Ex. office	1.16
Burden	1.97
Taxes	2.02
Auto service	.68
Advertising	.21
Rent, power, light, heat	2.74
	$25.38
Average cost	$83.36

The Wooden Shoe Sole

Wooden shoes and wooden soles for leather shoes are coming into greater use than formerly in this country, though the change is not very rapid or among people of all classes. It is a factory or a worker's footwear. The wooden sole keeps out water that would soak through a leather sole, consequently the wearer's feet remain dry under circumstances which would subject them to dampness if leather were worn. The wooden sole being warmer, the wearer's health is better during winter. Maple and beech are the best sole woods; and the most frequent wearers are miners, stable keepers, foundry men, teamsters, brewers, car conductors, and street workers. Lumber for soles is sawed two inches thick, but the thickness is reduced in manufacturing. Such a sole is much cheaper than leather and wears much longer. Noisiness and appearance constitute the principal objection to wooden soles.

Wood Box Manufacturers to Meet in New York

The twenty-first semi-annual meeting of the National Association of Box Manufacturers will be held at the Commodore Hotel, New York city, on October 7th and 8th.

Trade problems that concern the wood box industry and its allied industries will be discussed, and an interesting and profitable meeting is promised. The meeting of the association are always marked by cordial good-fellowship and practical common sense, and are growing in popularity.

Secretary Burr requests us to announce that all who are directly or indirectly interested in the production of wood boxes will be cordially welcomed to this meeting, whether they are members of the association or not. Non-members who wish to attend are requested to inform W. D. Burr, secretary, 1553 Conway Building, Chicago, Illinois, who will arrange hotel reservations, if desired.

Canadian Exhibit in London

The Department of Trade and Commerce, formerly the Canadian Mission in London, England, is to be congratulated on its enterprise in organizing and bringing to a successful issue the exhibition of Canadian goods held in London at the Agricultural Hall last month. The exhibition is the first of its kind ever held in Great Britain, and in view of the gratifying results it augurs well for Canadian trade in Europe; it is not too ambitious to suggest that the exhibition may be the precedent to others. Canada produces a comprehensive range of goods which are not made in Europe and others of a competitive nature which, it has now been established, will command a ready market.

Safe Guard Automatic Sprinkler Systems

In every part of the South there are manufacturing plants that have systems of automatic sprinklers installed for fire protection, and with the coming of real winter weather the danger of these being put out of commission by freezing looms large. Insurance Commissioner James R. Young, fire marshal for North Carolina, urges that these sprinklers be thoroughly safe-guarded against freezing, as an impaired sprinkler system is a liability and not an asset.

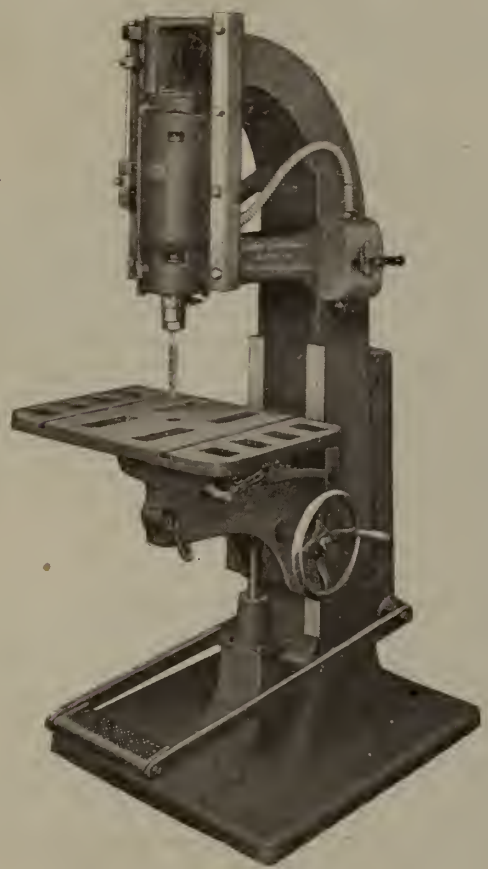
This inspection and precaution against freezing should include making sure that the heating plant is adequate for extremes in weather that may be expected; that the system is in thorough order with parts and supplies of all sorts at hand for any repairs that may become necessary; that all drains are in proper condition, and that any part of the system in any way exposed by windows, doors or between the ground and the first floor are amply boxed in and insulated against freezing.

The commissioner urges that the nightwatchmen, as well as workers about the plant generally, should be instructed thoroughly as to the use of all fire apparatus and the purpose and methods of handling all valves and connections. He suggests that fire extinguishers should be recharged something like once a year, to assure their being in perfect working order, and they should be insulated against cold if kept in exposed places.

Machinery & Equipment

Direct Motor Driven Vertical Boring Machine

Another application of direct motor drive in the construction of a wood working machine is shown below. It is a direct motor driven Single Spindle Boring Machine made by Baxter D. Whitney & Son, Inc., Winchendon, Mass. An alternating current motor having a speed of 3450 r.p.m. is mounted directly on the spindle in place of the pulley. The housing of

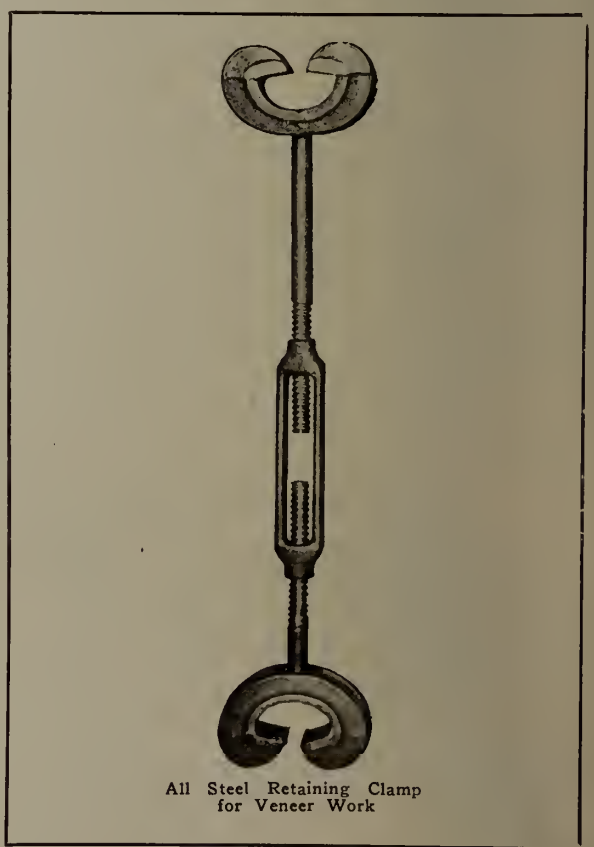


Whitney motor driven boring machine

the motor is made a part of the head that carries the motor and boring spindle, all of which is raised and lowered to the work as a single unit. This method of mounting the motor eliminates all extra bearings as the same bearings serve for the boring spindle and motor. The table is supported by a bracket having a vertical adjustment by means of a handwheel and screw. It can be turned end for end or can be tilted 45 degrees. A pointer and scale shows the angle at which the table is tilted. The boring bit is instantly brought down to the work by foot pressure on the treadle. By releasing the pressure the head is quickly raised and the bit withdrawn from the work by counter balanced weights. The spindle runs in self-oiling ball bearings especially designed for high speed. The motor on the spindle is started and stopped by a safety first enclosed switch mounted on the machine. This machine can bore holes to a centre of 32 in. and a depth of 9 in. and from ¼ in. up to 1½ in. in diameter. Some of the advantages claimed for this type of boring machine are: The elimination of countershaft and belts and a saving in floor space; it can be erected and operated in any desired place, regardless of shafting; it is an independent and compact unit; has a constant and steady bit speed and a true and even-running spindle; there is no slowing up of the spindle due to belt slippage. The manufacturers will be pleased to send interested parties descriptive booklet of this machine.

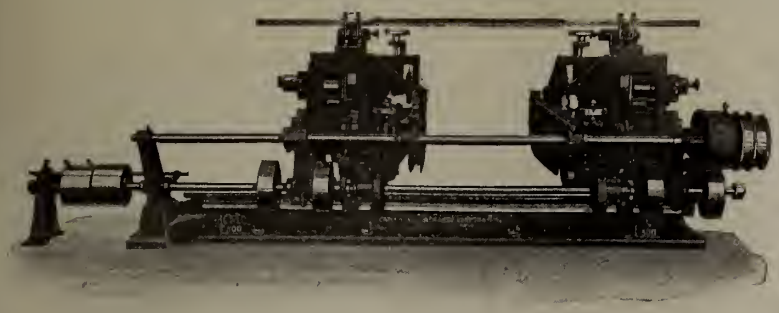
All Steel Retaining Clamp

A new all steel retaining clamp for veneer and panel work is being placed on the market by the Empire Tool Works of Toronto. The head used is exceptionally strong, being made of a solid steel casting. The rod or bolt is cold rolled steel and is threaded and riveted to heads. A special heavy thread running about four to the inch is used with the turnbuckle. This heavy thread is very much stronger than the ordinary V type and will wear longer, stand greater strains and give better service. The head is designed to suit the standard 4 in. I beam, used with veneer presser. The

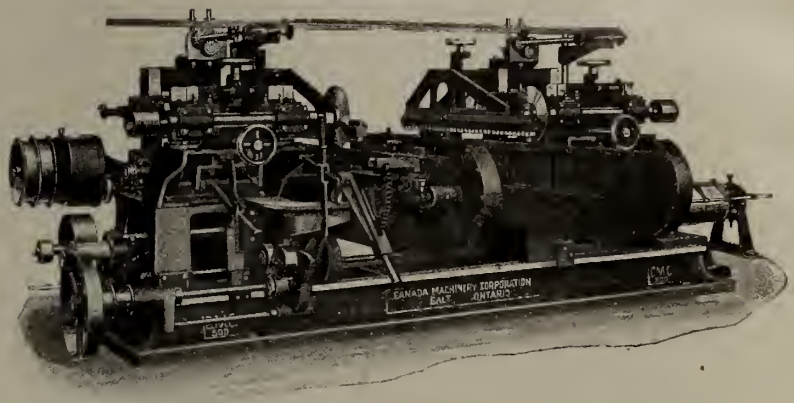


All Steel Retaining Clamp for Veneer Work

clamps are made in four lengths to suit presses of different capacities. Special lengths may be secured. The accompanying cut showing this clamp gives a fair idea of its rugged construction. It is designed and built for service and strength. For further information write the Empire Tool Works, Toronto.



Rear view of Double end tenoning machine



C. M. C. Double end tenoner. Front view

C. M. C. Double End Tenoner

The accompanying illustrations show two views of the new double end tenoner recently placed on the market by the Canada Machinery Corporation, Limited, Galt, Ont. Some of the features of this machine are the rigid support given all working parts by the heavy bed, the centralized control of all operating handles and levers and the independent drive to the tenon heads, cape heads and cut-off saws. It is designed to cut tenons from 1½ in to 28 in. wide and from ¼ in. to 4 in. thick. Will work from 7 in. to 66 in. between shoulders. The cut-off saws will trim stock from 7 in. to 78 in. The sliding base is moved to and fro by screw and reversible friction drive and may be locked in any position. The bearings are all large and solid. Standard wing type tenon heads are used. Three adjustments are provided for saw yokes. Vertical for depth of cut, horizontal for length of tenon and horizontal across machine to take up slack of belt. One cape head is used for door work while ordinary tenoning requires two heads to straddle the different sized tenons. The feed chain is open style and milled from steel. The links are 4 in. centres. The rear view shown shows cape heads and drive. The tight and loose pulleys are 12 in. x 8 in. and are driven 900 r.p.m. About 10 to 15 h.p. is required. May be had for motor drive, direct connected, if desired. Full particulars may be had from the above mentioned firm.

Another interesting truck exhibit was that made by the Packard Motor Car Co. Here they were demonstrating a special log-loading attachment for their trucks. This consists of a winch attachment driven from the engine, which is used to pull the logs from the ground on to the trucks. With such an attachment logs may be handled very expeditiously and at a reduced cost.

Mitering and Trimming Machines

The well-known Fox mitering and trimming machines are now being manufactured by the J. A. Fay & Egan Co., of Cincinnati, Ohio. This line consists of foot mitering machines and universal wood trimmers both bench and heavier type. The mitering machines are made in two sizes, one with a vertical stroke of 7 in., the other 4½ in. While these machines are designed primarily for mitering a squaring gauge is furnished which may be set to cut any angle from 45 deg. to 90 deg. The trimmers are made in different sizes, the heaviest type cutting a block 8 in. high. The bench model will trim at all angles between 45 deg. and 90 deg., while the larger machines give a wider

Fox trimming machine, heavy type

range 30 deg. to 135 deg. The carriage, which carries the knives, is operated by means of a rolling gear which meshes in the rack on the bed and another rack in centre of carriage. The power is thus applied at the centre of carriage, the operating lever moving in the same direction as knife. The J. A. Fay & Egan Co. will gladly furnish full particulars on application.

Upholstering and Trimming

Mohair as an Upholstering Fabric

Combines Luxury and Durability With Good Taste—Gives Many Pleasing Effects

If the average buyer or decorator was asked to name the most durable upholstery fabric, says a writer in the "Upholsterer," he would undoubtedly name mohair; if, on the other hand, the same man was called upon to name the most luxurious upholstery fabric, his reply would be the same, for, strange as it may seem, the mohair fabrics of today have the reputation of being the most luxurious textile in the market and at the same time the most durable. Mohair fabrics are, of course, not a new material. As far back as we can remember mohair textiles were an important material for the covering of furniture and for curtains. But some of the mohair fabrics we knew intimately thirty years ago would hardly be recognized as belonging to the same family as the fabrics of today.

Thirty years ago one of the most inexpensive coverings for upholstered furniture was an embossed Utrecht velvet or mohair plush. It was about twenty-four inches wide, solid color, and embossed in a wide variety of patterns, and it was employed in combination with bands of silk sash. At that time also a better quality of mohair plush was in common use for the covering of railway car seats, and it is perhaps due to the fact of its extraordinarily common use that it was not considered to possess the aesthetic qualities necessary for fine decorative work. An improvement of style developed in connection with the use of mohair plush for Pullman car upholsterings, but even then the full beauties of mohair pile fabrics had not been appreciated, and only in the last four or five years has there been anything like an equivalent appreciation of the aesthetic value of this outstanding textile.

Mohair materials get both their wearing qualities and their beauty of texture from the material employed, which is the soft, silky hair of the Angora goat, which sometimes grows eight inches or more in length. The animal takes its name from the town of Angora, in Turkey, from which country it has been introduced into South Africa and also the United States. The very finest grades of Turkish mohair are comparable to silk, and it is sometimes difficult for the uninitiated to distinguish between a very fine Turkish mohair velour and a silk velour of similar weight.

Commercial mohair velours of to-day show many modern developments. The embossed velour of thirty years ago no longer appears, but by a combination of jacquard weaving, of embossing, of shearing and subsequent steaming and finishing, a great variety of interesting fabrics are produced. Then there are also those which in the weaving produce alternate rows of cut and uncut pile, as well as those having the pile entirely made up of loops and others in which all the loops are cut. None of these various operations, by means of which a great variety of surfaces are produced, detract in any sense from the wearing quality of the material employed. Mohair furniture coverings invariably outwear the under upholstering, and there are records of railway-coach seats surviving constant use for periods of eighteen to twenty-five years.

In the very fine grades of plain mohair plushes, particularly in the dark shades, one often notices a sort of smoky effect or a bluish bloom, making it appear as if the fabric were dusty. This is due to the ends of the upright hair, the dye appears only on the sides of the hair, while the ends of the same are in reality minute tubes, too small for the eye to see, but their volume creates a difference in color caused by seeing only the ends of the hair.

Deep-upholstered Wicker Chair

During recent years wicker furniture has steadily grown in public favor. One sees in the retail stores wicker chairs with loose cushions, pads, seats and backs, wicker settees, tables, bed and living room furniture and even the wicker phonograph. One of the newer wicker pieces to be placed on the market is a heavily-upholstered wicker arm chair, a chair that rivals the popular Chesterfield for appearance and comfort. The back and seat is upholstered with springs and a good grade of hair. A spring edge has been added to the front of the seat. The bottom of the chair where the springs rest is specially constructed for strength and is reinforced with hazel supports. A chair of this type combines both lightness and strength and should tend to increase the popularity of wicker furniture.

Who Makes the Best Foreman?

Should Foreman be Promoted from Ranks or Secured from Outside Organization—Most Important Duty of Manager—Essentials to Consider

Though it is not always recognized as such, the choosing of a foreman is often a task of great difficulty to a factory manager. Opinion among factory executives differs widely on the question of who makes the best foreman. Should he be promoted from among the shop operatives or should he be imported? What are the essential qualities of a foreman? These are only a few of the factors in the situation. Everyone will agree that the ideal foreman is often difficult to find; when one considers some of the jobs he is expected to fill, the difficulty can readily be appreciated. He is the go-between, so to speak, between the workers and the management, and is frequently reviled by both.

The men in the shop often distrust him; indeed, some look on him as a spy. A lazy manager will delegate everything to him and then will haul the unfortunate foreman over the coals because he has not done everything, and at once. These are not all the troubles of a foreman. He often has to act as rate-setter to his shop, help set up jobs, interpret drawings, requisition materials, inspect finished parts, and act generally as a combined schoolmaster, ambassador and dry nurse to perhaps fifty ungrateful men under him and an unappreciative manager, ever demanding increased effort, above him. Needless to say, much depends on the foreman in a works. Given the right man, he is probably, though not officially, the supreme authority and the wise counsellor of management and workers alike. Given the wrong man the result is chaos.

Some Desirable Qualifications.

If one toured the factories of this country and sought advice from the managers of those factories on the supreme essential of a foreman, it would probably be found that tact, loyalty or executive ability would head the list. Tact is certainly an essential; a foreman without tact will always do more harm than good. Loyalty to the firm is again essential for the same reason. Executive ability, in handling a shop full of men whose actual trade experience may be greater than his own, is indispensable in a good foreman.

Trade experience is necessary, especially in any specialized job, as men will invariably respect a superior who knows more of their own jobs than they themselves do. If a foreman is in a position to deal with any technical query brought up by his own men, his place in their estimation will ascend by leaps and bounds. Couple this with executive ability and the foreman will be as near the ideal as it is possible in human nature to get. Foremen will, if given the opportunity, often suggest improvements in methods of manufacture or design that will be the cause of saving perhaps hundreds of dollars. Before a foreman will do this, however, it is necessary to have his confidence and to show him that his opinion on such and such a matter is entitled to respect and consideration on the part of the management. By so doing, the management will instil self-confidence into the foreman. If his suggestions are turned down again and again he will begin to think that either he or the management does not know the business. Further, the foreman's authority must be upheld. Any foreman, however capable, will hesitate to take up a position if he is not sure of the adequate support from his management. Such support is absolutely essential in developing a good foreman.

We know that managers are divided on the question of importing foremen. Some will say that it is better to bring in a stranger as the men will have more respect for him there if he had been promoted from their own ranks. This holds good sometimes, not always. If a foreman is promoted from the shops and he is the right man, the men will respect him more than they will a stranger. Further, if men see that the policy of the firm is to promote men from their own shops, they are provided with an incentive to good work in the hope that they too will stand a chance of promotion. Further, one of the company's own men knows the firm. That is, he understands the policy, the method of working, and can often get something done by purely unofficial means, means which would not be afforded to the stranger. If foremen are imported, the men are often resentful and become discouraged, seeing no prospect of promotion before them. Occasionally, of course, it is necessary to bring in an outsider for some specialized task; for instance, when there is really no man in the works who has the necessary trade experience.

Where difficulty is experienced in promoting a man from among his colleagues on account of his not being able to maintain his prestige, this difficulty can often be overcome by transferring him to the foremanship of another department. Though in a factory where the finished product entails a large number of operations, it is always better to keep a foreman in his own department, where he is familiar with the technical details of manufacture, and where he knows the methods of the shop. In general, it may be said that if a man is not capable of commanding the respect of his former colleagues, then that man is not suitable for foremanship.

Powers Should Be Defined.

When a foreman is appointed it is absolutely necessary that he have his scope indicated to him. If he does not know when and where his authority begins and ends discipline will inevitably suffer. As he will be responsible for the discipline and production of his shop, he should be allowed all means, within reason, to achieve those ends. "Ways and Means."

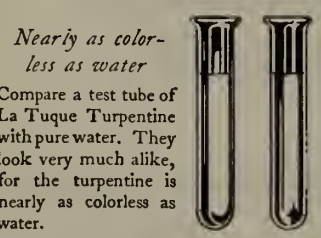
Nearly as colorless as water

Compare a test tube of La Tuque Turpentine with pure water. They look very much alike, for the turpentine is nearly as colorless as water.



Dip a piece of pure white paper into our new Canadian Wood Turpentine

THIS is an easy, practical test of this new turpentine, made from Canadian Wood, by a patented process.

After dipping the paper to about one-half its length, place in a warm spot to dry. In a few minutes when the turpentine will have evaporated completely, compare the portion dipped with the remainder of the sheet. It will be clean and unstained, with no trace of grease of any kind.

As a thinner for wood fillers and enamels, and oil and japan colors, it is very satisfactory. It is also giving good results in some types of oil-stains, due to its smooth, even evaporation and great penetrating power.

And because it is an all-Canadian product, made from wood cut in the forests of Quebec, it naturally possesses a price advantage. May we tell you about it? Liberal samples are gladly sent upon request.

Making and Working Different Stains

A Few Simple Formulas for Securing Various Shades—How They Should be Applied—An Attractive Finish on Mahogany

By John N. Moore

Stains are used for two purposes, either for changing the color and apparent character of the woods, or for emphasizing the prevailing color. In the first case, such as making a birch to appear like mahogany, or in the latter case in making a real mahogany over so that it becomes a darker shade. In one instance this idea is to cleverly enrich the common stock so that it has the appearance of being a more expensive wood, and in the latter case stain brings about a uniform coloring so that various and large pieces may match in shade so that they may be used in the same piece of furniture.

The cabinet maker has a great assistant in the simple standard stains supplied by paint and varnish manufacturers, and as the difference between good and poor work is only a matter of very slight expense, both as regards time and labor, it behooves the finisher to use the best.

Much of the wood used in modern cabinet making is veneered, and in many cases the veneer is first stained or dyed before being laid on the common wood. Some of this dyeing is done in steam heated vats which contain chemical solutions and special facilities are also provided for the drying of veneer as it is stained, and great care is necessary in order that the wood does not split in this latter process.

Staining Cheap Work

A considerable proportion of the cheaper furniture is made to resemble mahogany by simply giving it a coat consisting of a mixture of venetian red and glue size. They give the surface a coat of this and then let it become perfectly dry. This, however, is merely a foundation for the true color, which in some cases is a mixture of a cheap varnish and some inexpensive staining material, for instance, bismarck brown, or in a case of this inexpensive furniture, a mahogany water stain is mixed with a thin glue and applied to the direct wood, and after it has been allowed to dry, is sandpapered lightly and given a couple of coats of varnish. Oftentimes the work is let go with only one.

If you are manufacturing these cheaper grades of furniture and wish to imitate cherry you can use a little burnt sienna, first staining the bare wood with raw sienna mixed with glue size, after which apply a coat of burnt sienna stain. By using a brush and some of the stain which is in the bottom of the pot and which has been allowed to become heavier than that generally used, you can quickly create an effect like mottled cherry. You should rub out some of the first coat of burnt sienna stain so that it will look like a stain and not like a paint. This will make the brush markings which we have referred to, stand out more distinctly and look more natural. A skilled and careful workman can make some very handsome pieces in this way; it all depends upon how clever he is.

Using Umber and Siennas

Burnt umber may also be used to give a rather good walnut stain or you can use vandyke brown and burnt umber, or the darker walnut. You can mix these earth pigments with water and vinegar alone. You see the vinegar in this combination acts as a binder, but water alone will not give a stain that would hold out. Some of the pigments, however, would remain in the pores of the wood and some of it, of course, would show on the surface, yet the effect would be unsatisfactory and not stand up under usage. The glue size, made very weak, provides a good strong binder for water colors. Stale beer used to be used for this purpose, but was never entirely satisfactory.

When you are reproducing a mahogany effect, burnt and raw sienna furnish a good ground color, and over this a livelier mahogany color may be put with success. Mix a little bismark brown with your varnish first coat and finish with a clear coat of varnish after this. Saunders wood and dragon's blood give a good color for making mahogany stain. You can steep one ounce of red Saunders wood in one pint of alcohol, carefully strain it, to this add a little more shellac gum and after using this as a foundation give a coat or two of varnish.

Stains Darken Not Cover

There is one thing which the finisher should always remember, and that is that the object of staining is primarily to color the wood and not to hide its grain or surface as does paint. If you have your stain too thick you get a sort of painty effect, therefore, it is always well to have your stain thin and brush or rub it out well. Of course, there are occasions where you may want to hide an unattractive figure of the natural wood, and in this case the stain should be heavier.

Some pigments are transparent and some are opaque, but the latter are more desirable to use in wood staining. Umbers are perhaps the best earth pigments, both in the raw and burnt, and burnt and raw sienna, vandyke brown, etc. All anilines are transparent, they having no body, but have unusual staining and penetrating powers. If the pieces of cabinet work in hand have a lot of mouldings, etc., you want to be sure that the stain gets in all the little corners and to have the whole ornate part match the rest of the work. After giving this carved portion a coat of stain let it stand for a while and then use a clean rag in wiping off. In this way you can remove more or less of the stain according to the effect you desire. As a rule any stain left upon the surface will harm the appearance of the finished work. You also get a more uniform appearance when wiping off the stain. When you first stain this you may later wipe in any direction, but always finish up by rubbing with the grain of the wood.

Mahogany is seldom finished in its natural state, it not being as fine a color as when enriched with the

use of filler stain, varnish, etc. You see some varieties of mahogany come very light in shade and there are, as you know, several varieties of this wood. All show a difference in color and even in one certain kind of mahogany, you will find the color varying, and the old idea of applying linseed oil and then wiping it off does not correct this matter. Alkanet root which has been steeped in raw linseed oil often times accomplishes good results. This oil imparts fine color and is sometimes known as red oil. A good receipt is as follows:

Take two ounces of the root and use with a paint of raw linseed oil in which to steep it. Use this as a stain and then finish up in any way you desire. If you wish to get a darker shade use a water stain made from one ounce of bichromate of potash to 2½ pints of water, and you may lessen the amount of water in proportion as you wish the shade darkened. First, however, you might try two applications of the weaker dye and the shade may be varied to almost any desired one, by using the potash solution in various degrees of strength, and then later applying the red oil. In this way you may darken a mahogany almost to the color of rosewood or chippendale.

While these are simple little formulas they are given in no way as intending to discourage the use of the standard stains which come from our reputable manufacturers. We simply give a few points which may help the cabinet maker and finisher in the proper staining of wood.

Is Finishing Department Always to Blame?

Trouble Encountered in Finishing May Not be Fault of Department—Defects in Veneer May Spoil Finish—Stock Not Properly Dried—Send Along Your Experience

By Harold Sutton

The finishing department is sometimes blamed for troubles which are due entirely to faults in the stock to be finished or careless handling in other departments. In an article on selecting veneers, which appears on page 89 of this of this issue, Mr. Johnstone says that the finish to be applied should be considered when selecting or purchasing veneers for a certain job or article.

If the finish calls for several coats of varnish the veneers chosen must be sound and free from ruptured fibres. Unless this is the case, the expansion and contraction of the wood, due to atmosphereic changes, will eventually cause fine hair-line lines to appear in the varnish wherever the fibres are weak. Sometimes when the varnish has been standing for a considerable period and is hard and set, that is has lost a large proportion of its elasticity, these minute lines appear when the surface is being rubbed and polished. When this occurs the finisher is often in a quandary for he little suspects that the wood itself is at the bottom of his trouble.

Temporary Improvement Made

If the varnish has not set hard, these marks may rub out temporarily, but if the varnish is hard they will likely develop into unsightly marks. Even if they have been rubbed out before the varnish has hardened they will likely appear at a later date. Atmospheric changes will cause slight movements in the surface veneers. This movement will be greatest where the wood fibres are weakest. In other words the weak places will move the most. Thus, through time, after the surface hardens, they will appear again. It will be seen by this that the extra coat or two of varnish, so often given, cannot be depended upon to effect a permanent cure. The fault is inherent in the wood itself.

The minute lines caused by weaknesses in the veneer itself must not be confused with the checks caused by shrinking, due to the drying out of the stock. In the latter case the veneer as well as the finish checks and opens. This trouble may be experienced after the goods enter the finishing room and even when in process of finishing. When checking occurs it may be laid to careless work in the veneer department or to careless handling between the finishing and veneering department. If the work was perfectly dry when it left the glue room it was permitted to take up moisture while being worked up. In the warm finishing room this moisture is eliminated from the surface, with the result—checks or cracks.

How to Treat Checks

Defects in the finished surface caused by checks in the wood may be greatly improved, if not remedied, by a simple treatment. Rub the varnished surface thoroughly with oil and pumice stone. Clean off all oil and allow work to stand for, say, twenty-four hours. This gives the oil in the cracks a chance to work out. Clean off again. Next apply a coat of thin white shellac, cut about one pound to the gallon. This coat should be spread on quickly with little brushing, to avoid all danger of causing streaks. The shellac tends to neutralize the oil and also to seal the openings and pores of the wood. It will also enable the succeeding coats of varnish to stand out.

The shellac should be given plenty of drying time, say twenty-four hours, then sanded lightly before applying the varnish. Care should be taken not to sand through the shellac to the coats below, for if that should happen the finish will show up patchy when varnished. After giving one or more coats of varnish the work may be proceeded with as usual.

Opportunity for Co-operation.

Finishing troubles that are caused by defective stock or through careless handling of work in cabinet, gluing and machinery departments, are real live, ever present issues with all finishers. It would be both interesting and instructive if a number of readers of this article were to describe some trouble they have experienced where the fault lay outside the finishing department, giving the causes for the faulty finish and how it was overcome. Will you co-operate?

Good lighting will speed your shipments through the following causes:—

(a) greater speed in trucking,
(b) markings more correctly read,
(c) fewer mis-sent shipments,
(d) fewer thefts,
(e) improved relations with the public.

Are you buying current or illumination ?

Dipping Tank as Aid to Production

Offers Many Peculiar Problems—Testing Stains for Strength—Securing Uniform Results—Safety Measures to be Taken—Does Not Injure Veneers

By H. R. Rolphe

Dipping will color small parts better, quicker and cheaper than any other process. Nor, is its use confined entirely to small parts; larger work which must be finished cheaply is handled in this way.

Unlike the spraying of stain, which produces the same effect until all the stain is used up, dipping will result in lack of uniformity unless care is exercised. The stain must be kept of uniform strength, so that the last piece dipped will be the same color as the first. The coloring matter used in stains varies in its affinity for the wood, so that one coloring matter in the mixture may become depleted before the others, gradually changing the stain, so that the first and last pieces dipped are of quite different appearance. While this is not so important on some things as on others, there are many articles for which the dipping process is employed where cognizance of this peculiarity must be taken. Hardwoods absorb less vehicle and consequently will exhaust the color in stains quicker than soft woods..

Keeping Liquid Uniform.

Dipping stain can be kept of uniform strength by keeping a standard sample of the original stain used in the dipping tank and also having on hand strong solutions of the various ingredients used in the stain. By drawing off a pint sample of the stain in the dipping tank and holding it to the light, comparing it to a sample of the original stain, or staining two pieces of wood any falling off in color can be noticed. Another test is to drop some of the stain on a clean blotter and notice it spread. The different colors will form circles the stronger colors spreading out further than the weaker ones.

These rings in comparison with rings made by a sample of the original stain will tell you which color or colors need renewing. To bring the stain back to its original color, the pint sample drawn off from the tank should be brought up to the same color as the sample of the original stain with the stock solutions of the different components of the stain.

Calculating Amount to Add.

Multiplying the amount of each ingredient necessary to bring the pint to the original color by eight will give the amount required for a gallon and multiplying by the number of gallons in the tank will give the amount of each material to be added. Inasmuch as the tanks are usually square, the number of gallons in the tank can be determined in cubic inches.

When the stain runs down and no longer covers the work to be dipped, the stain already in the tank should be brought up to its original strength before the new stain is added. In this way it is not necessary to make up a new lot of stain and fill the tank to the required depth.

Small pieces to be stained by dipping are handled in wire baskets. The wire basket is immersed in the tank and worked up and down. The contents are then dumped into the upper end of the dipping board to dry. Cheap goods, after being dipped are allowed to drain; the stain that drains off running back into the vat. Better work should be wiped to avoid runs; that is where a surplus amount of stain accumulates.

Dipping Stains Stronger.

Dipping stains should usually be made a trifle stronger than those applied with a brush because dipping does not "work the stain in," the way brushing does. When the articles are to be wiped the dipping stain should be stronger than when they are not to be wiped or the immersion longer so that the final effect will be the desired shade. It is more essential to wipe hard wood than soft wood because hardwood does not absorb the stain so readily, sometimes leaving air cells or patches when the immersion is done quickly.

Dipping stain may be used hot or cold. When it is to be used hot it is usually kept warm with a steam coil or steam jacket. A steam jet, for water stains only, works better in a large vat than a small vat because the condensation adds too much to the amount of water.

Care should be taken to keep the stain at an even temperature so that the penetration will be uniform. The stock to be dipped should also be of uniform temperature. Stain used hot penetrates deeper giving a darker color and dries quicker than cold stain.

Applied to Veneer.

For this reason on veneer work and work having glued joints, the stain should be used hot. Inasmuch as it is simply a matter of "in again, out again," no trouble should be experienced on veneered and glued work if proper care is taken.

An oi lstain containing naphtha should not be used near an open flame. An open flame should not be on any floor below an oil stain dipping vat because the vapor will run along the floor and follow an elevator shaft or stair opening. Good circulation of air should be provided and the vapor carried out of doors as quickly as possible. When a vat of oil stain is not in use, draw off the stain into air tight cans, otherwise the solvents will evaporate and cause a change in color.—"Finishing Facts."

Moisture Resistant Finishes for Woods

A report recently issued by the National Advisory Committee for Aeronautics, describes briefly a series of experiments made at the Forest Products Laboratory, Madison, Wisconsin, to determine the comparative moisture resistance of linseed oil, impregnation treatments, condensation varnishes, oil varnishes, enamels, cellulose varnishes, rubber, electroplated and sprayed metal coatings, and metal leaf coatings when applied to wood.

All coatings except the rubber and electroplated metal coatings, which were not developed sufficiently to make them practical, admitted moisture in varying degrees. The most effective and at the same time most practical coating was found to be that of aluminum leaf.

A copy of this report may be obtained upon request from the National Advisory Committee for Aeronautics, Washington, D. C.

Sugi or Driftwood Effect

A feature of the exhibit of the B. C. Lumber Commissioner, at the C. N. E., that attracted considerable attention and received much favorable comment, was a large library table and upholstered chair made of B. C. fir and finished in a dark driftwood effect.

This finish, which was originally copied from the Japanese, is known as the Sugi finish. It is secured by charring the surface of the wood with a blow torch, then removing the charred wood with a wire or other stiff brush. The softer portion of the grain chars to a greater depth than the hard part, thus when brushed the grain stands out in relief. This is known as the drift wood effect.

In this particular instance a dark brown coloring material, such as umber, was rubbed into the wood after the charred part had been removed. This gave it a rich, dark brown appearance that proved to be very attractive.

This finish may be varied slightly by varying the length of time the torch is applied, thus controlling the depth to which the wood will be charred. If the length of application is such that the softer parts are just blackened, a very pleasing effect will be secured. The soft part of the grain will show up black in contrast to the natural color of the hard grain.

Best results are secured with a wood like B. C. fir or other woods which have a fairly coarse grain and in which there is considerable difference between the hard and soft portions of the grain.

Whitewash is a good fireproof covering as well as an aid for conserving the lighting bill of a mill.

Is Use of Walking-Sticks on Decline?

Shifting use of wood, because of fashion or custom, is illustrated by the result of a recent survey of the wood-using industries of New York State. In 1912, there were several cane, whip and umbrella handle manufacturers in the state—this year's survey shows not a single manufacturer of walking sticks or whips and but one of umbrella handles. And yet New York and Massachusetts until very recently supplied about 40% of the total product of these articles with most of the remainder coming from Pennsylvania.

It has been questioned whether canes have gone out of fashion as a result of the war and whether the automobile has entirely driven out the whip.

The manufacture of such apparently small articles as whips, canes and umbrella sticks annually has required the equivalent of five million board feet of lumber, although much of the material has never been put into lumber form, and the rarer imported kinds are purchased by the piece or pound.

Among the native woods used for this purpose, beech has supplied 57% of the total consumption and maple and birch 33%. All three woods are used for whip stock and umbrella sticks, although handles are frequently made of ebony. Many imported woods and roots are used for the more expensive canes and umbrella sticks.

What do you think of a contrivance by the side of your saw bench or your planer which will always keep the timber the same height as the bed of the machine?

Stains **ENAMELS** Fillers

THE PRICE OUTLOOK

In Paint and Wood-Finishing Materials

MARIETTA WOOD FINISH SPECIALISTS

Linseed oil is not as high as it was. Some people think this should mean an immediate drop in prices of paints and wood finishing materials. It is only necessary to look at the facts to see that there is no ground for such a conclusion.

How Linseed Oil Affects Paint Cost

Paint is two-thirds pigment and one-third vehicle. This one-third is made up partly of linseed oil and partly of the necessary dryers. So that less than one-third, even of the highest grade paint, is linseed oil.

The other two-thirds consist of pigments and coloring materials. These were never known to be so high.

Lead never was so high and there is talk of another advance. There is not enough available to supply the demand, at any price.

Dry colors are scarce and advancing.

Turpentine is 300% higher than during the war.

Stains and Fillers

When it comes to stains and fillers, such materials as benzol, toluol, alcohol, dyes, etc., are abnormally high with no reason to expect a downward movement.

As to wood filler, it takes a twenty-five cent drop in linseed oil to justify a quarter of a cent drop in filler with other things normal, which they are not.

Containers are higher than ever and harder to get. Packing cases ditto, with prices advancing.

Labor—well, you know about that.

Freight Advance Gets Us Going and Coming

Then there's transportation. The rate increase recently allowed by the government gets manufacturers going and coming. They must pay it once on their raw materials and again to get their finished products to the consumer. To say nothing of the increased cost of traveling men to visit the trade.

Order Early to Get Service

There is no reason whatever to put off buying at present prices, and with present day embargoes on shipments, the earlier you can order, the better your chances of service.

So far as we are concerned, we shall welcome the first opportunity to reduce our prices if it can be done on the logical basis of lower costs of production and distribution.

The Marietta Paint and Color Co.

Marietta, Ohio

Southern Factory, High Point, N.C.

When the blacksmith shod his own horse—

A disc grinding operation—heavy work!

> *"Habits cease to become more efficient when no practical motive compels improvement."*
> *Chap. III, p. 108—Psychology and the Day's Work.*

"I don't give a rap how big the job is," said Kylin, "Count me out on outside work for awhile. I'm going to feed a little concentrated Foster efficiency to our own factory."

Out in Elkhart, Indiana, Kylin, an efficiency engineer, is head of the Foster Machine Company's Engineering Service—a service department that has gained a big reputation "by increasing output and lowering the cost of production in many factories by recommending the proper combination of tools."

The Motive

Perhaps it was the reputation gained by this service department—perhaps it was the splendid name of their Universal Turret Lathe Machines for efficient performance—at any rate orders were coming in so fast that the Foster factory production was running about two jumps behind.

A few days later Kylin started on the sleuth through his own factory, looking for places to inject a few Foster service ideas and so speed up production.

When he came to the grinding department he nailed George Henderschot, who runs the big Disc Grinder.

"What's an average day's production, George?" he asked. George told him. "Humph," grunted Kylin thoughtfully. "Are those the best discs made?" "I dunno, Mr. Kylin," said George, "I guess they're all right." "Let's find out," said Kylin. "I'll send for sample discs of every blooming brand made. Try 'em out and give me a report."

The Improvement

"As a result of the tests which caused us to adopt Manning Speed-grits Metalite Discs," wrote Mr Kylin lately, "we have doubled production on our Disc Grinders, and cut our grinding costs about one-third."

Incidentally George Henderschot is pretty well pleased with the increased production resulting from those Speed-grits tests. Why shouldn't he be? George is on piece-work.

Good workmen know the difference.

The above photograph shows the Nichols Equipment installed in the works of the Votey Organ Company, Garwood, N.J. These dryers may be used to turn out automobile bodies, furniture, pianos, talking machines, etc., in as many days as it formerly took weeks, and the finish is better, for it is dried scientifically, from the inside out.

If not already Nichols equipped, you owe it to yourself at least to investigate, because:—

1—It will easily triple the output of your finishing rooms.

2—It will decrease congestion in your factory.

3—It will decrease the investment in goods necessarily in process.

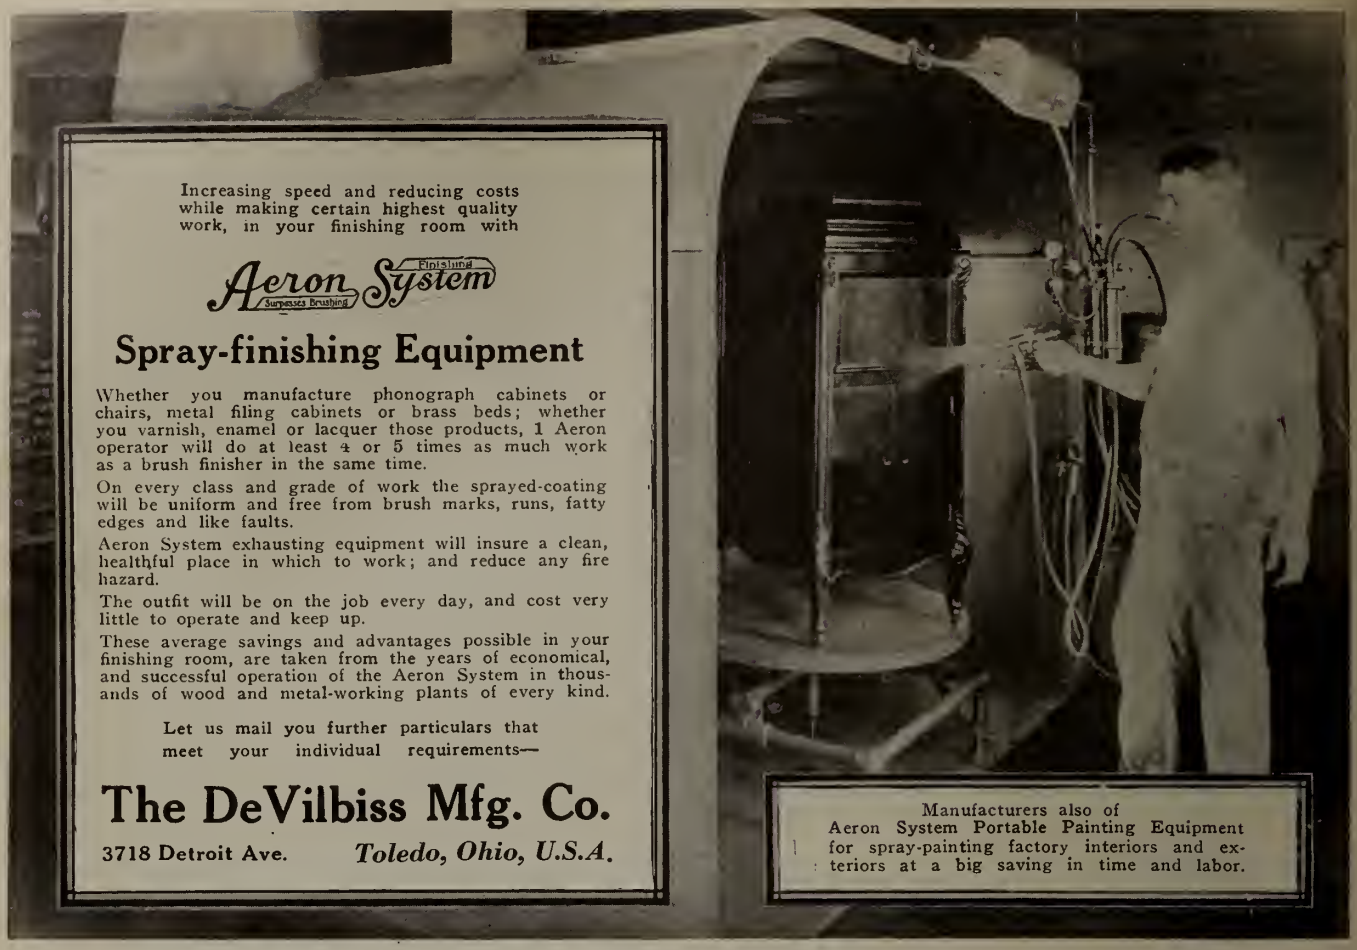
4—It will enable you to make more prompt deliveries.

We will analyze your particular conditions and then make you a proposition on an equipment that we know, from our extended experience, will save you time and money, as well as improve your product.

We guarantee fully the efficiency of the equipment as well as its mechanical construction. Every installation has been successful. There are hundreds of concerns to whom we can refer you.

A. S. NICHOLS COMPANY, 33 W. 42nd St. NEW YORK CITY

Manufacturers of Dryers for Lumber, Veneers, Glued Stock, Varnish, Paint and Enamels, for both high and low temperature work. Also sole agents for "Zenitherm" insulating material for the making of rooms for both high and low temperature drying.



Increasing speed and reducing costs while making certain highest quality work, in your finishing room with

Aeron System (Finishing) Surpasses Brushing

Spray-finishing Equipment

Whether you manufacture phonograph cabinets or chairs, metal filing cabinets or brass beds; whether you varnish, enamel or lacquer those products, 1 Aeron operator will do at least 4 or 5 times as much work as a brush finisher in the same time.

On every class and grade of work the sprayed-coating will be uniform and free from brush marks, runs, fatty edges and like faults.

Aeron System exhausting equipment will insure a clean, healthful place in which to work; and reduce any fire hazard.

The outfit will be on the job every day, and cost very little to operate and keep up.

These average savings and advantages possible in your finishing room, are taken from the years of economical, and successful operation of the Aeron System in thousands of wood and metal-working plants of every kind.

Let us mail you further particulars that meet your individual requirements—

The DeVilbiss Mfg. Co.

Veneers and Panels

Most Important Thing in Veneering

Quality of Product Depends on Veneers Used —Selecting Stock Requires Careful Attention—Width an Important Factor

By S. J. Johnstone

"Buying and selecting veneers," answered an experienced veneer man when asked his opinion as to the most important thing about veneering, "You cannot make a silk purse from a sow's ear, neither can you turn out a high-class veneer product unless a suitable grade and quality of veneer is provided."

It stands to reason that as the face stock is the part that is seen, the value of the panel or completed article is judged from the quality, appearance and finish of a few outside pieces. As long as the face veneer does not loosen or check or the piece warp, it makes little, if any, difference what kind or grade of material is used for the core. The value is judged entirely by the outside appearance and the satisfaction given. That being the case, and there is no disputing it, it is hard to understand where any advantage accrues from using the poorer and consequently cheaper grades of veneer. The finished product may cost a few cents, or, even a few dollars, less but it will not command as high a figure on the open market. The loss in value seldom compensates for the slight difference in cost.

Price Not All Important.

The important thing is to have the most suitable or, in other words, the right veneer for the work in hand. There are many nicely-figured veneers offered, which owing to some slight defect, are not altogether suitable for face work. Unless the person in charge of the buying is both careful and conscientious, he may be tempted to take a chance on such a defect passing unnoticed in the finished article and stock up on the cheaper line. The same result may occur if the buyer is not thoroughly conversant with and able to judge the value of the samples placed before him. If the price and figure seem good he is often satisfied with the lot, as in his eyes cost and appearance are the most important factors.

It is usually extremely difficult for any but the most experienced to judge the effect and extent of a defect or blemish. It depends largely on the nature of the fault, the kind of stock and the work for which it is required. The finish also plays a very important part. If it is to be used on an article that is to be heavily coated with varnish, the veneer must be perfectly sound and free from ruptured fibres. Unless this is so, the expansion and contraction resulting from atmospheric changes will cause fine, hair-line checks to appear in the varnish wherever the fibres are weak. Sometimes when the varnish has been allowed to stand for a long period, to set and harden, long enough to have lost its elasticity, these minute marks will appear during the rubbing operation. When this occurs, the finishing department is often in a quandary, little thinking that the face stock is at the bottom of the trouble.

It is a good plan to carefully examine all veneers, both samples and the shipments received, for fine checks or ruptured fibres. The better plan is to call in the veneer-room foreman and even the foreman finisher and consult with them. They have handled thousands of feet of various kinds and different grades of veneer, and from the experience gained, can often tell at a glance whether a certain lot will work satisfactorily or cause endless trouble, complaints and friction. It is surprising what years of practical experience will teach.

Again, a powerful hand-glass or magnifying glass is a useful assistant to have around. Weakened and ruptured fibres that are not visible to the unaided eye, are plainly seen through a glass. With a little practice one can readily detect ruptured stock and pick out the rough places that indicate weakened fibres. It stands to reason that if there is any movement or strain, the weakest spots will give way first. If there are not any such weak places, any movement will be taken care of by the whole face, and checks or fractures should not appear.

Size of Stock Influences Cost.

The size of the flitches or sheets to buy is often a debatable point that requires careful consideration. The narrower and smaller pieces are usually the cheapest. Is a direct and visible saving of a few hundred dollars on a 50,000 foot purchase of narrow veneers better than the indirect and often undetected decrease in manufacturing costs that would result were wider stock to be purchased. Certainly the former is more spectacular and might catch the eyes of those higher up. For this reason the order is often given for the lower-priced stock.

It is more than doubtful if this is true economy. The buyer should know the exact use to which the material he is buying is to be put, the cost of the drop in production due to the extra cutting, jointing and taping, necessitated by the use of narrow stock. Another point is when narrow stock is worked up, an excessive amount of small and waste pieces usually result. The better way is, if possible, to secure stock that will work on the wider faces without jointing them. All unnecessary jointing and taping will then be eliminated and manufacturing costs reduced that much. If the wider stock is secured it will likely result that when the medium width pieces are being got out, sufficient edgings and cuttings will remain to veneer the smaller faces and strips. Thus a saving in time and material will be effected that will, probably, more than offset any initial saving which might result from the purchase of narrow and cheaper stock.

A good grade of material of width that will work to the best advantage, bearing in mind the quality and value of the finished product and the effect of the raw material secured on production costs, is a good rule by which to purchase veneers. If the stock in question is of doubtful value, the veneer foreman and foreman finisher may have some valuable suggestions and advice to offer. Their experience has made them competent judges, so do not hesitate to consult them.

The Care and Grinding of Veneer Knives

Veneer Knives Most Important Part of Cutting Equipment—Should be Given Careful Attention—Choice and Care of Emery Wheels—Suggestions for Grinding

By J. H. Mather

After giving the matter of care and grinding of veneer knives very careful study, I am inclined to question whether the manufacturers of grinding equipment have devoted as much time to the development of grinding the edge of veneer knives as has been given other classes of grinding. Possibly it is because the importance of the veneer knife and the veneer business has not been realized or appreciated. I believe it is as important an operation as grinding a cam or a shaft, which can be ground to the thousandth part of an inch.

Conditions vary so, in different sections and in cutting different stock, that it is impossible to give any set rules for the care of veneer knives. As soon as a knife is put in operation, it begins to wear, and this sooner or later results in a dull edge, and the knife has to be sharpened—the cutting edge put in proper condition for its work. This can be done by honing, but it is only a question of time before the knife has to be ground. Under these conditions, I think you will agree with me that the most important items in the care of veneer knives are grinding and honing. The men doing this work should know the construction of a knife, and, as the grinding is done with a manufactured wheel, should know the principles governing the action of it, and should realize the important part the veneer knife plays in the operation of the veneer plant.

Construction of Edge

The cutting edge of the veneer knife is of a high grade of high carbon steel, welded to a backing of a lower grade of steel. Knives vary in thickness from ¼ in. to ¾ in. The high carbon steel is ¼ to ⅜ in. thick; the bevel is from 1½ in. to 2 in. making the cutting edge of the knife very thin, which it must be to do the required work. After the knife is hardened and drawn to the proper temper for its work, the high carbon steel is very much harder than the backing, which, being so low in carbon, will not take much, if any, temper. In grinding, stock has to be removed from two grades of steel; in addition to this the point of contact is broad, and the grinding done on thin stock on the high carbon side of the knife. The edge being so thin it is very easily injured.

The grinding wheel is the only known tool that is, and should be, self sharpening. The principles governing the action of the wheel in grinding are these:

The wheel is made up of many particles or grains of abrasive material, each of which has a sharp cutting point, or angle, which, when presented to the work, removes more or less of the metal. These sharp cutting points become dulled with use, as the cutting point loses its sharpness; the strain or drag upon the particles of abrasive material become so great that the bond holding it lets go, the grain of abrasive material being torn from the surface of the wheel. Of course, this results in decrease to a certain extent in the size of the wheel, but in the place of the dulled and now worthless grain another with sharp-cutting point is brought to the surface; so, in the properly bonded grinding wheel, used under proper conditions, this resharpening goes on without any, or with but little outside attention.

In a wheel of such nature, or used under such conditions as to prevent each grain being torn from the wheel when it becomes dulled, the continued dragging or friction between the particles making up the wheel and the metal being ground generates heat and this may become so great as to result in drawing the temper of the knife. On the other hand, it is possible to have the grains of abrasive composing the wheel so weakly bonded or to use the wheel under such conditions, that they will be torn from the wheel before they have actually become dulled. Either of these conditions results in unsatisfactory work and is extravagant. Between the two lies the happy medium wherein each cuts and continues cutting until it becomes dulled to the point where it is no longer useful, and it is then torn from the wheel.

Temper Must Be Preserved

If a place in the knife or the whole knife is heated hot enough to draw the temper, that knife afterwards is no earthly use for cutting veneer, although it might possibly be retempered by the manufacturer. If the knife is blued or checked in grinding the steel is ruined, and before the knife is any good again the steel has to be removed below the injured part.

While grinding, a knife would have to be heated to about 950 degrees to show red. At this heat it begins to show a very dark red. In discussing this point with an expert on tempered steel, he claims that a knife would have to be heated hot enough to show color to be injured. If water is used in the operation a knife heated to about 950 degrees or possibly a thousand. would be likely to check, being due to the heating, and the water cooling it causing it to contract so suddenly. If grinding with a coarse wheel and a little pressure it takes only an instant to heat the thin edge to a blue, which means about 575 to 600 degrees of heat; with a coarse wheel, if water is used, it would not show blue but would show a crack. If ground dry would show very blue and make a soft temper, or a soft spot in the knife.

Attention to Grinding

Water is, or should be, used in the grinding process, not as a means of quenching heat but, rather to prevent its creation and radiation. It is a necessary means of keeping the work at an equitable temperature, to obviate heating as well as distortion. The supply should be plentiful and steady, better if applied at the grinding point, and with sufficient force to keep the wheel face clean. It also washes away the particles which wear off of the wheel. This helps to prevent glazing. Clear water is better than water that has been used over and over as the dirt in the water that has been used has a tendency to fill up the face of the wheel causing it to glaze.

Some recommend a grinding compound for this class of work. The only thing I can see in favor of a compound is that the oil or grease in it might adhere

CONTINUOUS SERVICE FOR TWO GENERATIONS

One of our principal competitors recently paid us the compliment of the voluntary statement that our position in the hardwood and veneer trade was the result of never varying from the traditions on which our organization was founded.

Northern Grown Oak

Fifty-two years of making and finishing the right kind of product has resulted in service of that character becoming not only a trade asset and the basis of a National reputation, but a veritable business habit. Our endeavor has for so long been to never deviate from the standards of 100 per cent. excellence as laid down by those who founded this business, that it is practically a matter of impossibility for us to vary the quality of our goods without a complete reorganization over to a high-speed, quantity basis.

American Beauty Walnut

It is recognized by the discriminating trade that our service incorporates not only goods of the highest possible excellence, but thorough understanding of the customer's requirements in order that his share of our always choice selection of goods may be precisely what he prefers.

Our knowledge of customers' needs and our ability to exactly meet those needs, recommend our service to you as a careful and experienced buyer.

Care and Grinding of Veneer Knives

(Continued from page 109)

to the edge of the knife and have somewhat of a soothing effect. Often the men doing the grinding feel that if water is used there is no danger of heating, in fact, I have heard them say so. This is a mistake, and often a costly one.

My observation is at the present time very few disk-shaped wheels are used for grinding veneer knives. I am glad of this as the disk-shaped wheel grinds the knife with a concave bevel, slight at the start but, as the wheel decreases in diameter, the concave becomes greater, thus weakening the knife just back of the cutting edge, where the strength is needed. Where a disk wheel is used, as the diameter of the wheel decreases, the speed of the wheel should be increased to maintain a uniform rim speed. A cup wheel, in my opinion, is the proper wheel for grinding veneer knives. If the grinding is done on the full face of the wheel it will give a straight bevel as the wheel wears down.

In the selection of wheels, put it squarely up to the manufacturer of wheels just what kind of grinding you intend to do and the conditions under which it will be done, and insist on a wheel being built for the job, and not take a wheel and try to do the job with it. If a wheel is not suited to your work it should be returned. In conversation recently with one of the members of the Chicago Wheel & Manufacturing Co. he made this remark: "It is poor business for a grinder to continue to use a wheel that is not doing the work satisfactorily, and we would much rather replace it with a wheel that would." I know other manufacturers of wheels feel the same way.

A grinding wheel must be kept running true. A wheel running out of true delivers a blow at each revolution, and as there would be several hundred such blows delivered per minute, this would cause undue heating and drawing of the temper in the knife. If a wheel tends to heat and glaze unduly, that wheel is called too hard and that tendency may be overcome by reducing the number of R.P.M. of the wheel. On the other hand, if the wheel seems too soft, that is, if it tends to free itself too readily and will not stand up from one end of the knife to the other without appreciable reduction in size that may be overcome by increasing the R.P.M. of the grinding wheel, always keeping within the limits of safety, which ordinarily would not be over 50 or 60 per cent. higher than the normal working speed. If water is used, then not more than 40 per cent higher. The reason for this is, at a slower speed the particles of the abrasive material tend to be torn from the wheel by the work more readily than at a higher speed. On the other hand, at the higher speed they are less readily torn from the wheel, and the dulled particles or grains are not gotten rid of as easily as is desired.

Honing and Sharpening

A free and cool cutting wheel, fed to the work at the proper pressure, will not leave a wire edge but will leave a further edge. A wire edge causes more honing. To remove the false edge quickly, draw a piece of end wood across the edge of the knife, which removes particles of steel clinging to the edge. Then hone to a perfectly true smooth edge. Should there be a rough place in the edge of the knife, although not noticeable to the naked eye, particles or fibres of the wood are liable to get in or catch on this rough place, causing it to break out. These spots or places can be detected by drawing the thumb nail across the knife The edge must be absolutely smooth to give perfect cutting. Too fine a grip or grain will not grind; it simply polishes. Grit 24—medium soft and makes a cool, fast-cutting wheel.

Proper honing is as necessary as proper grinding. In honing, the hone should rest on the whole length of the bevel and the full length of the hone on the face side of the knife, thus keeping the edge true with the bevel. If the knife is honed a number of times between grindings, this cannot be followed, as you are obliged to hone on the extreme edge and, consequently, will have a rounded edge. I know some good operators will, in honing a freshly ground knife, round the edge slightly. I cannot understand why this is done unless the operator thinks it the quickest way to get rid of the wire edge. I beleive it more economical to grind often and keep the cutting edge straight, than it is to hone or whet the edge as much as would be necessary with less frequent grinding, as one is very liable to whet low places in the edge.

Retaining Correct Angle

Th manufacturers of veneer cutting machines have carefully determined the best length of bevel to maintain on knives for use on their machines, and the operators of such machines should maintain this bevel as carfully as possible, so they will know exactly what lead to give the knife for the class of work they intend to cut, and still maintain the correct position of the bevel of the knife to the different curves of the log as the log is reduced in size.

In order to understand why the change of the bevel of the knife will change the angle of the cutting edge, take a pencil and paper and draw a circle, and at the proper cutting position draw the bevel edge of a knife showing 1⅞ in. bevel. At the same time, draw a line showing a 1½ in. bevel on this same knife and see the relative position of the 1½ in. bevel and the 1⅞ in. bevel to the log. You will readily see that the 1½ in. bevel knife will have to be tilted in with the edge toward the log in order to have the round of the log clear the bevel of the knife, so that the cutting edge will take hold.

Although it will consume some extra time, it is good policy to saw off pieces from an old knife and bolt one at each end of the knife, on the knife carriage. It prevents grinding the ends of the knives where the wheels run off and start in from being ground lower than the rest of the knife.

The importance of the work which the veneer knife has to do warrants the best grinding equipment and this, to get the best results, must be kept in perfect repair. If the bearings become worn, allowing play, it is liable to produce end motion to the wheel spindle, which will make high and low places in the edge of the knife. This condition will also occur if the ways of the carriage are worn and do not travel through without lost motion, which means poor grindings, often costly grinding and loss of knife stock.

Knives Most Important Item

Some suitable place should be prepared for the knives after they are put in condition, when not in use. They can be bolted on boards, which will protect the edge, and then placed on racks. It is so easy to nick the edge of a knife, although it is only a 1/32 in. or 1/64 in., it is just that much loss of cutting stock, besides the time putting the knife in shape again.

If the pressure bar is set too hard against the log it has a tendency to lift the log, and if there is any

play in the bearings it raises the spindles and log, just as much as there is play in the bearings. If short logs have been cut on a lathe and then long ones are to be cut, it is well to see that the pressure bar has not been worn out of true; if it has, it should be ground straight, otherwise it may result in slack cutting where worn, and tight cutting in unworn places.

Very recently, while calling on one of the large veneer companies, the manager and I were out in the plant. While talking to the man who has charge of the cutting, as we were looking at the knives, he remarked: "This whole plant depends on the knives and they must have the best of attention, and under no consideration would I allow the grinding and honing to be hurried." Often the men doing this work do not have as much time as they should for it, having so many matters to look after.

I have been calling on veneer manufacturers for some years and naturally studied the conditions in different plants as to the care and attention given their knives. I find the men who give the best attention and care to their knives are the ones who keep their knife account the lowest for the volume and grade of veneer cut.

In the matter of equipment, the veneer knife is, as compared to the other equipment and supplies, the most important as the volume and quality of your output depends entirely on the knife, so the item of care of the knife is a very important item in your manufacturing cost.

Poor Knives Sometimes Get Out

The manufacturers of veneer knives are human, and, unfortunately, will make mistakes. Consequently, some knives that are not up to par will get out, which is regretted by manufacturers more than by the parties receiving the knife. Should you receive a knife that is not suitable for your work, do with it as I have advised your doing with an unsatisfactory wheel—return it, and it will gladly be made right.

If you receive a letter from the firm manufacturing your knives asking how a certain knife shipped on a certain day is working out, and if you can see that it is better than other knives furnished by them, it means that they are trying to give you a better knife, either by using a better steel or in treating it differently, and are asking for your opinion as much for your benefit as for their own. Some time ago, in one of the trade papers there was an article on veneer knives which rather implied that the veneer knife manufacturers were not trying to improve the quality of veneer knives. Not wishing to criticize the article, or the writer, I will say that the manufacturers of this class of knife are honestly trying to give a better knife. If you receive such a letter, it is much for your benefit as theirs to give them a candid opinion.

Development of Interior Paneling

Demand for Paneled Interiors Increasing—Tracing Evolution of Paneled Work —Wood Panels Have Appeal Not Found in Other Materials

By J. C. Taylor

There have been sold and distributed this year more composition wall boards for interior ceiling and paneling than in a ten-year period preceding this year. Also there has been a lively centering of interest upon the subject of wood paneling and wood wall lining, not only for residences, but also and particularly show windows, stores and business buildings.

These are but two of several factors which lend special interest right now to the subject of wall paneling, where it started, and why, and where it may lead to. There are in the present situation some good opportunities to develop a public interest in and taste for woodwork for interior walls and finish, and some understanding of how the present situation has come about may point the way to proper future development.

The idea of wood lining or wood paneling of walls to-day may be traced back to various periods of civilization and development in the older countries of Europe. Incidentally, too, we find them associated with what we term as periods in furniture, which are so popular in this country to-day. This is worth keeping in mind because there is an element of harmony between the period paneling of walls and the period furniture designs which we have adapted from those times. We can, of course, trace the wood lining of walls back almost as far as the history of building goes, but for the present-day purposes it is hardly necessary to go beyond those pioneer days of architectural development in the old countries of Europe.

History of Paneling

Illustrative of how the wood-lined or paneled wall came about in those countries, there appeared in the lumber press recently a story of paneling development in England which, in substance, was as follows:

In the early days the builders had a plentiful supply of stone, and soon developed the making of brick from clay, so those pioneer buildings were in the main stone or brick, with tile or stone slab roofs. In building with stone or brick the natural order of things was to finish or smooth over the inside surface with a mortar, and it was out of this that there was developed the plastered wall. These plastered walls required something to support them, a form of furing and lath, because the plaster material would not bond firmly to the inner surface of either brick or stone. This called for extra work and the use of wood, and it was not long until the people came to understand that it would be almost as cheap in money and effort to finish all, or at least quite a part, of the interior walls with wood paneling. In the pioneer days this wood paneling was done in solid wood, usually rather heavy and massive, because they had not learned the art of veneering and making large, thin panels. Panels were thick and heavy and required frame-work support. This, in turn, led to carving and various forms of decorative effects, to relieve the monotony of straight lines in constructing the framework and the panels.

Attention was centered mainly upon side walls rather than the ceiling. It turned particularly to stairways and their enclosures, which called for framework, anyway, and in which there was naturally sought to develop character and beauty.

Many different ideas of art and architecutre were developed in different parts of the old world in inter-

Development of Interior Paneling

(Continued from page 110)

ior woodwork, just as there were developed many different patterns and styles in furniture. Generally, however, there was a harmonizing of the wood lining or paneling in the building and the furniture design and decoration. Therefore, when we take for a pattern in our modern furniture designs some ideas from a specific period in furiture of the older countries, we may well go back to that same period in architecture in the same country and seek for ideas which can be developed in harmony with the offerings of the day in furniture.

When we turn to our own country we find that the pioneer builders here worked mainly in wood. Here and there were some brick buildings, and brickyards were among the early development, because they were well known in the older countries. Timber was so plentiful, however, that the majority of the pioneer builders turned first to logs, and then to lumber, for building operations. For the interior lining there has always prevailed in this country the use of both plaster and the wood lining or ceiling, with a gradual development of the decorative or paneling idea. When there were very few saw mills and lumber had to be produced by hand there was an inclination to use plaster more extensively than later, when saw mills had developed and made sawed lumber more plentiful.

Shows Gradual Evolution

With the saw mill and the planer there came an era of wood ceiling, of building the houses with weatherboarding on the outside and a ceiling of matched lumber similar to that used for flooring on the inside. Sometimes only the side walls were so ceiled, the overhead joists being planed and beaded and left exposed below, with dressed and matched flooring above.

This was a very common type of building until the development of our gypsum industries and the extensive introduction of what is known as hard wall plaster. Then we had an era of plastered walls which gained in prominence until the war period. Then there developed a scarcity of lath, help and everything else, and out of it grew an opportunity for competition wallboard, which had for some years been struggling for recognition in the structural world. The wallboard being made in standard units has again brought forward the paneling idea and an interesting situation which furnishes opportunities for the educational exploitation of wood for lining and paneling interior walls.

There is a wide field and a variety of ideas are possible in this development. There is the purely residential field, the churches, schools and public edifices, the office or business buildings, and the stores with their show windows and interior decorations. These make, all told, an extensive and widely-varied field of opportunities for developing the use of veneer and for introducing a new era in interior wall finishes.

Pleasing Effect of Wood Finish

Finished woodwork has an appeal and a pleasing effect not furnished by any other material, and those who use it for interior decoration seldom have occasion to regret it, especially if with its use is combined a proper sense of the artistic and there is the right order of harmony between the woodwork and the walls themselves, and the furniture which is contained therein. A study of the trend in furniture should bring some interesting light on what to promote in the way of ideas for the interior paneling of the home.

In the show windows and stores, artistic ideas are already being rapidly developed. The main need of the day seems to be that of centering attention upon standardizing panel units for interior wall linings of homes, and special decorative panel effects for the more elaborate architectural undertakings.—"Veneers," Indianapolis.

Large Door Factory for B.C.

The Canadian Western Door Co., Limited, Mission City, B. C., has been recently organized with a capital of $50,000, to manufacture sash and doors. The company will establish a large sash and door factory in Mission City, with a capacity of about 1,000 doors per day. The factory building will be 70 x 400'. Two dry kilns will be constructed with a drying capacity of 36,000' a day. The plant when completed is expected to cost in the neighborhood of $135,000, and employment will be given to about 75 hands, the monthly pay-roll amounting to $10,000. The site consists of 5½ acres and adjoins the C. P. R. on one side and the Fraser River on the other, thus giving both rail and water transportation.

The present officers of this company are C. C. Pierce, president; R. L. Gallinger, vice-president and manager, and R. B. W. Pirie, secretary-treasurer. Mr. Gallinger is thoroughly conversant with the sash and door business, having had about twenty years' experience at the business. Mr. Pierce is vice-president and manager of the Home Savings & Loan Association of Seattle, while Mr. Pirie is a chartered accountant of wide experience. The company has been assured, by several leading export companies of Vancouver, of sufficient business to take care of its entire output.

Of Course—This Doesn't Refer to You

How few manufacturers realize the greatly increased cost of manufacturing boxes in small lots—particularly in these times of high labor costs. Competition, carelessness and lack of accurate knowledge of costs are perhaps responsible for the present practice. Very few manufacturers are making any money on small lot business. Yet they continue to fill orders of that character. True they demand a higher price per unit for a small order than for a larger, but that increase in price represents but a fraction of the increased cost.

Most manufacturers who have studied their costs have discovered that they are losing money on small lot business, and being wise have either refused to sell at a loss or have declined to accept small lot orders.

No manufacturer is willing to admit that he likes small lot orders, unless he gets a good price. He carefully explains that he is forced to accept that business, because of peculiar conditions surrounding certain trade, or the unusual competition which requires that he continue to do that kind of business. In other words, he is at the old and honorable game of "kidding himself." It is a game played in every section of the country and is the most expensive game a man can play. Next to "passing the buck," "kidding himself," if not the king, is at least the knave of indoor sports. —The Wood Box.

INDIANAPOLIS - - - IND.

Distribution of Canadian Hardwoods

(Continued from page 80)

are left to weather the winter blasts of the sub-Arctic regions. It is a curious fact that the heaviest and densest woods are found in the mildest climates, and it is also evident tthat as far as the broad leaved trees are concerned in Canada, those producing the softest wood are able to withstand the coldest climate.

It is not my intention to imply that hardwoods are extremely rare in Canada, but the fact that their distribution by Nature has been so limited, undoubtedly indicates that the supply is far from being inexhaustible. It is a fact, however, that in the case of many species the original supply has been commercially exhausted. In the days of early settlement, such hardwoods as white oak, hickory, black walnut and cherry, growing as a rule on land well suited for agriculture, were cleared off by the settlers to make room for field crops. Whenever marketable, they were used locally, in many cases finding their way into the humble snake fences and log buildings of the pioneers. Quite frequently the logs were burned in huge bonfires merely to rid the land of a useless incumberance. The lumbermen have completed the commercial extinction of many of these trees and at the present time the small remaining supply is confined to isolated patches of trees or single specimens in farmers' woodlots. White ash, white and rock elm, hard maple, basswood, and the less valuable oaks have been exported in considerable quantities to the United Kingdom in the form of square timber but this trade has fallen off rapidly in later years.

Hardwoods Receiving Greater Attention

The methods of logging in Canada have been developed chiefly for the utilization of the coniferous woods such as pine, spruce, hemlock and cedar, and in Eastern Canada of the transportation of logs from the wood to the mill has been accomplished by river driving. This method does not lend itself to the utilization of hardwoods, in connection with which the loss due to sinkage is almost prohibitive. On this account as well as on account of the small demand and the greater expense in connection with sawing hardwoods, the Canadian lumbermen in the past have paid little attention to the hardwoods except in those cases where the supply happened to be located near the mills. Owing to the great increases in the price of hardwoods as well as other lumber, many of our lumbermen are now paying more attention to such woods as birch, beech and maple. In many cases they are building extensive logging railways for the purpose of transporting hardwood logs to their mills from limits long since cut over for pine and other conifers and temporarily abandoned. Within the next few years, we will undoubtedly see great developments in the production of hardwoods, such as birch, maple, beech, elm and basswood, which are the most important of those which remain.

A few statistics on hardwood lumber production might not be out of place at this point. In 1917, the latest year for which complete figures are available, Canadian sawmills reported the production of 147,165,000 board feet of what are classed as hardwoods in our reports. (The term includes all trees other than the conifers whether their wood is actually hard or not.) This production in included wood of the following species and groups of species:

Birch, 60,000,000′; maple, 21,000,000′; elm, 19,000,000′; beech, 16,000,000′; basswood, 15,000,000′; poplar, 10,000,000′ ash, 7,000′000 oak (including all species) 2,000,000′; other species (including cherry, chestnut, butternut, walnut, etc.), 400,000′.

These figures of course include only sawn lumber and do not include material taken in the form of bolts, billets, blocks, logs for export as such, square timber, nor cordwood used for fuel or for wood distillation.

Imports Greater Than Exports

Unfortunately, our customs, trade and navigation returns do not show the exports and imports of wood products by kinds of woods. With regards to oak, however, a comparison is possible. Canada produced in 1917 only 1,894,000 feet of oak lumber, and during the same year imported from the United States 34,484,000 feet. In the cases of hickory, cherry, walnut, chestnut and to a less extent of ash, the importations exceed the production of sawn lumber. In addition to sawn lumber, Canadian manufacturers imported in 1917 partly-manufactured products, such as rough-sawn felloes of hickory, handle, heading, and stave bolts, hickory billots, hickory and oak spokes, rough sawn or split hub blocks, last blocks, wagon blocks and gun stock blocks and other hardwood, in an unfinished state other than sawn lumber, to the total value of more than a million dollars.

If the supply of hardwoods in the central states is now showing signs of falling short of the demand, the American manufacturers should not rely too much on Canada's forests to make up the deficiency, except, to a limited extent, in the case of yellow birch, beech, maple and basswood. In the event of a shortage, the manufacturers using hardwoods as a raw material on both sides of the border are faced with the problem of insuring for themselves a supply of such material for the future. This naturally brings up the question of scientific forestry and the growing of forests for the future.

We are asked the question, "How long does it take to grow a tree?" The answer cannot be given in so many words, and if made too definite, is rather apt to lead to misunderstanding. The rate of growth of trees varies with each species, with the climate, the soil, the exposure and the character of the mixture of trees in the forest. Figures can be quoted for growth rates in certain definite places under certain conditions but averages and generalizations are of doubtful value. As a general rule, trees grow more rapidly in mild climates, and the rate of growth of the hardwoods in Tennessee is no doubt more rapid than in Ontario or Quebec. Generally speaking, the hardwoods of Canada are found on better soils than the conifers and in many cases on soils which are more valuable to the country for agricultural purposes than for the growing of trees. It can hardly be expected therefore that plantations made at the present time on waste lands will result in trees of the same size and quality as those now being cut on potentially agricultural land. Certainly, the rate of growth will not be so rapid, and figures based on measurements of trees now being marketed will not apply to the new plantations made on less favorable sites. It would be quite safe to say that plantations from seeds or young seedlings set our on non-agricultural lands in Canada will not produce yellow birch, beech, or hard maple of ten inches diameter in less than a hundred years. In the case of paper

(Continued from page 114)

birch, this estimate might be reduced to 80 years, and in the case of aspen poplar to 70 years.

Now, these figures may sound discouraging, but it should be born in mind that we have in Canada many thousands of acres of timber berths from which the conifers have been removed, leaving the hardwoods are seed trees. This has resulted in a heavy seeding of hardwoods, and the young forest now establishing itself is composed of a majority of trees of these species. Depending on the extent to which the limits were cleared, and the time which has elapsed since the clearing, the young growth of hard woods has reached a certain development. In many cases, where forest fires have not destroyed the reproduction, this second growth has already reached commercial size, and new areas will grow into this condition each year if properly cared for. Therefore it is not altogether a question of starting over from the beginning to replace hardwoods, but of applying scientific principles to the care of the young forests already established and above all, of protecting them from fire and careless utilization.

With the object of gathering information which would be of value in solving the problem of the future supply of wood for our industries, the Dominion Forestry Branch in 1911 began a systematic investigation of the wood-using industries of the country and gathered data on the kinds of wood used by different manufacturers, the amount consumed in an average year, the sizes and grades demanded for different purposes, the prices paid for this raw material, and the sources of supply. These studies covered the provinces of Ontario and Quebec, three Maritime provinces of New Brunswick, Nova Scotia and Prince Edward Island, and the Three Prairie provinces of Manitoba, Saskatchewan and Alberta. It was intended to repeat the studies of each of these regions and to include British Columbia, returning to each region once every five years. The war interfered with the carrying out of this program, but it is planned to resume the investigation by a study of conditions in Ontario this year. The results of the investigation up to 1915 when it was temporarily abandoned, were very satisfactory. An idea was gained of the needs of the Canadian manufacturers in this respect, and a great deal of valuable information was published in reports covering each region treated.

Substitute Native For Imported Hardwoods

The question of substitution of native woods for those imported from other countries was dealt with, particularly in the case of hardwoods, where the importations are especially heavy. While I do not pretend to be enough of an expert in wood manufacture to advise selection of raw material, I am convinced, from the results of this investigation to date, that a great part of this importation could be avoided by the use of home grown timber. Materials of a certain quality from a certain source are demanded by certain industries. In many cases, this demand is based, to a certain extent, on custom or usages and not altogether on the qualities of the material as related to the use to which it is to be put. In many cases, a cheaper wood from local sources would serve the purpose of a manufacturer equally as well as the imported material. As distant pastures are forever green, so material brought from a long distance often acquires a reputation out of proportion to its actual or intrinsic value. In the early days, when lumber was cheaper and more abundant than at present, manufacturers were able to pick, for each part of their final product, the wood best suited for that particular purpose. The finished article, like the "Deacon's One Hoss Shay," has no weakest point and lasted in its entirety untill it finally all fell apart at once. The increased cost of lumber has forced modern manufacturers to abandon this policy to a certain extent where the public has found that cheap replacement is more economical than maximum quality at a high initial cost. Changing fashions are to be noticed in manufacturers of wood as well as in clothing and the Deacon's famous vehicle, though no doubt the acme of perfection as One Hoss Shays went in those days, would now be considered a little odd to say the least, even if it had held together down to the present time. However, it can often be clearly shown than the substitution of a cheaper home grown timber makes little or no difference in the value of the product.

Conservation of Material

The question of utilization of waste was also dealt with in this investigation. In come cases, it was found that a manufacturer was burning, under his boilers as waste, small pieces of wood of the same size and quality as another manufacturer was using in the same town as a raw material for his product. Instances of this sort were of course rare, but we were able in many other instances to put manufacturers into touch with one another to their mutual benefit. It usually happens that the waste from one factory is of many different sizes and shapes, and in such a case, it is almost impossible to find a good use for such material; but any manufacturer who has waste material of uniform size and quality, no matter how small, should make an attempt to locate a purchaser of such material before destroying it. The Forestry Branch frequently receives inquiries from manufacturers with waste to sell and others looking for small sized materials and it is prepared to do all in its power to assist in this form of economy.

The Forest Products Laboratories established at Montreal in connection with McGill University has a staff of experts whose services are available to the public for the purpose of solving technical problems in connection with the anatomy, chemistry, mechanical properties, preservation and utilization of forest products generally. Information obtained by research or collected in the library is at the disposal of the public at any time. Our head office staff is also ready and willing at any time, to answer other enquiries from lumbermen and wood-users concerning our forest products.

Interesting Truck Exhibit

In the automobile and truck section the Swedish Crucible Steel Co. of Canada, Limited, Windsor, Ont., were showing the well-known Olson frame extensions for Ford trucks. These frame extensions are made in two types. One consists of an extended frame with heavy springs and extended drive shaft and housing, which increases the length of the wheel base and frame of the truck and enables longer bodies to be carried. The other units consists of extended frame with heavy springs and is used lengthening the frame without increasing the length of the wheel base. Ford trucks, fitted with these extensions and long bodies are particularly adapted to bulky loads, such as furniture and other forms of woodwork.

Information and Inquiries

You are cordially invited to make use of this department

Oil in Dry Kiln Coil

Lake Megantic, P. Q., Aug. 31/20.

Editor, "Canadian Woodworker".

We operate a hot blast dry kiln, using the exhaust steam from our engine. Lately we have not been able to maintain the temperature we formerly secured. Would oil from the exhaust steam, lodging in the coil, cut down the temperature? How can this oil be removed? Would an oil separator prevent a re-occurrence of the trouble? Any information you can give will be appreciated.

Yours truly

W. R. Fish & Son.

It is rather difficult to diagnose your trouble. An accumulation or coating of cylinder oil on the inside of your heating coils would certainly tend to retard the radiation of heat. On the other hand something may have gone wrong with a valve or a stoppage may have occurred somewhere. It would be well to test the coil and make sure that the usual volume of strain is blowing through. If the trouble is due to oil passing a strong solution of caustic soda through the coil would help some. This solution could be left in the coil for a few hours, depending on strength, then flushed out with clean water. It may take several applications to remove all the oil.

An oil separator would certainly keep most of the oil from the coil as a good removable plate separator will take about 98 per cent. of the oil out of the steam. With that proportion removed it would take a long while for a sufficient accumulation to occur to cause trouble. Would suggest checking coil for volume of steam passing through before doing anything else.

To Prevent End Checking

An inquiry was published in the August "'Canadian Woodworker" with reference to a coating to prevent end checking. In addition to the materials suggested for coating the ends of the stock we have learned that a mixture of whitewash and glue makes a coating that will last a year or more and will tend to prevent excessive drying at the ends. This mixture is made by adding a quart of good glue and three pounds of salt to a barrel of whitewash. Another method for overcoming this trouble is to place the piling sticks at the very end of the boards, a slight overhang is even better. The weight of the pile acts as a clamp and keeps the stock from checking. If the sticks are allowed to protrude they will shade the ends from the sun and will also carry off the rain, thus reducing end staining. It is a simple method and one that should be adopted in all piling.

Trouble from Walnut Checking

A furniture manufacturer writes in asking if we can suggest a solution for the trouble he is experiencing through the checking of walnut. The checks usually appear after the articles are finished and in the warehouse. He asks if walnut should be strained or is that wood dried to better advantage without straining. He also wants to know how to test for moisture content. Will some of the readers of this journal co-operate and send in their views on this trouble and outline similar experiences with the remedy applied.

The Better Way to Hang a Door

The efficiency of an extra butt is no longer a much-mooted question. Throughout the country there is a general trend on the part of architects and builders to hang a door on three butts. In fact, to serve this growing demand manufacturers are now packing butts three to a box, constituting a set.

To say that doors are one of the hardest working parts of any building, especially public buildings such as schools, hospitals, theatres, railroad stations, is to repeat a fact everyone knows. After all, it is the butts that make or mar the door. On them the stress and strain, the wear and tear, are bound to centre. Even the best butts are tested beyond capacity at times. The weight or load of the door is excessive. Green lumber which often has to be used on the door results in warping.

Careful analysis of the subject shows that there are many logical and practical reasons why the use of three butts to a door is true economy in the long run. It has been demonstrated that the third or extra butt will hold the butt edge of the door in alignment and, to a great extent, will prevent the door from warping. Also, it prevents the door from striking or interfering with the door stop, if used, or the edge of the rabbet, if the door jamb is rabbeted when the door has a tendency to bow or warp toward the door stop or the centre of the door jamb.

While it may take more time to put on the extra butt and while the cost is slightly increased, the saving of the carpenter's time and expense later on to correct door faults more than offsets the initial investment.

If a door is hung on two butts only, each butt carries one-half of the load or weight of the door. When a door is hung on three butts, each butt carries only about one-third of the weight, thereby decreasing the strain and wear. More screws are driven into the door jamb and the door, thus relieving the strain on screws, the wood in the door jamb and in the door, which is an important factor.

When three butts are used the top butt can be set nearer the top of the door, thereby lessening the leverage of the door pulling away from the jamb. The lower butt can be set lower, thereby preventing the door hugging the door jamb near the bottom of the door. The top edge of the door remains in line with the head jamb, and the bottom edge of the door is parallel with edges of threshold.

The binding and sagging of doors are expensive troubles to correct. Do it right at first.—"Building Age."

Acquires New Line of Equipment

The J. A. Fay & Egan Co., Cincinnati, Ohio, manufacturers of woodworking equipment, have acquired patents, drawings, trade mark, rights, etc., for the Fox Universal Wood Trimmers and Miterers, formerly manufactured by the Fox Machine Co., Jackson, Mich. All orders for new machines or for repairs for machines now in use should be sent to the J. A. Fay & Egan Co.

May We Make This Suggestion?

To those buyers whose requirements of hardwood lumber, rotary veneers and panels it has been our privilege to serve and to those others who we hope to serve in the future, we would like to frankly and in friendliness advise that bad as the car situation is to-day, it is bound to be infinitely worse in a month or two. Therefore, to insure delivery and avoid the 30 or 40 per cent. increase in freight rates, due about September first, we earnestly counsel buying now.

May we suggest also that our friends should not reckon too strongly on much lower prices? It is true that the present tendency is downward, but while the southern forests are now pretty well dried out, the almost total impossibility of getting cars is keeping millions of feet of logs in the woods, where vast quantities are rapidly deteriorating. A goodly portion of this accumulation probably never will reach the saw mills. Thus, while one adverse condition is out of the way, another immediately takes its place, and though southern manufacturers have succeeded in making one spurt in production, the average mill stock in the south is still dangerously low. The consequence of such condition has been brought home with force to buyers in the past eighteen months.

This is but a friendly suggestion offered only because we think it absolutely true. Therefore, if you possibly can, buy now. As to price, our only assurance is that now as always, our policy is to give full value for every dollar invested with us.

ALL
SOUTHERN
HARDWOODS

The Lumber Market

Domestic Woods

The market for local woods is distinctly quiet, very little stock moving. This condition is also reflected in quotations, which show recessions on practically all lines. The large increase in freight rates recently granted is bound to have an effect on the movement of lumber. Higher freights will tend to restrict the moving of lumber and should result in practically eliminating Southern pine from the Canadian market. This will tend to strengthen local softwoods. The new rates will also have a tendency to curtail the quantity of B. C. wood which is being shipped to Eastern Canada. The B. C. products will continue to supply the prairie demands while the softwoods in the east will not be called on to face the same competition.

White pine is about the strongest item on the softwood list with red pine coming next. Spruce and hemlock are very quiet, especially the former. The prices of the different lines reflects the demand so that quotations on hemlock and spruce have fallen off considerably.

Among the hardwoods, birch is holding up the best, being in fair demand, with prices standing up well. The other hardwoods are quieter and weaker. While conditions should improve in the near future, one reason for the present lull is the attitude of the lumber buyers and users who are holding aloof and buying for immediate requirements only. Maple is very slack and may show further declines in price. Instead of removing the 10 per cent. duty on this wood, the U. S. authorities are collecting the duty at points of entry which have been allowing maple to pass in free. This has a tendency to restrict the market for this wood. Other hardwoods are more or less slack. It is reported that in some sections of Ontario there are considerable quantities of air dry lumber but that in other localities the stocks are low. A decided improvement, both from the viewpoint of the buyer and the seller, should take place in the near future.

Imported Woods

According to the latest reports conditions are quiet in most of the hardwood producing centres. This is attributed partly to general business conditions and partly due to the fact that the larger wood users are not buying. The tendency seems to be to work from hand to mouth with most of the buyers covering for immediate requirements only. Values have eased on most lines, in fact it is difficult to find an established price for any one item as quotations differ, even from the same centres. As yet there does not appear to be any large accumulation of stock in the hands of the manufacturers. In some of the producing districts many of the smaller mills have closed down leaving the larger operators to accumulate stock. The opinion has been expressed that hardwood prices will not drop much further but the tendency will be for stabilization at present levels with the possibility of an upward tendency after the New Year sets in. It is not anticipated that values will reach the high levels set during 1920 but that there will be substantial increases over present prices.

The Chicago market continues dull. Very little buying is being done. Purchasers are demanding big concessions but lumbermen are not inclined to sacrifice stocks. Purchases by railroad companies bright spot in market.

In Evansville conditions are a little brighter. There was a falling-off in volume of business during August but trade is picking up slightly. It is not anticipated that there will be further price reductions. Some are inclined to think that the day of cheap lumber is over and that each year will see values increase slightly. Logs seem to be plentiful but prices asked are unusually high. Increased freights will effect lumber values.

Quietness rules in the Memphis market, with somewhat easier quotations. It is estimated that the total decline from high levels has reached 25 per cent. A wide range of prices is being asked. Quarter sawn white oak being quoted from $200 to $250 per M. Buyers in this district are holding back waiting developments. All buying is being done on a small scale to cover immediate needs. The manufacturers are quite optimistic about the future but believe that the lumber market will come back strong.

Furniture Woods in Far East

Whether Adam or any of the Adam family were expert cabinetmakers or not, the original Adam homestead in the Garden of Eden has always been the centre of a great and active furniture industry. Armenia, Turkey and the republic of Georgia, on tthe Caspian Sea, are noted for the high grade walnut veneer and wood products produced there, and the people of those countries seem to possess an instinctive knack for converting hardwood into attractive pieces of furniture. The Near East Relief, which is engaged in its program of relief to the refugees and orphans of that part of the world, finds carpentry one of the most important phases of its industrial reconstruction work. Believing that helping the people to regain their economic independence is almost as important as keeping off starvation, the relief workers have classes in shoemaking, tailoring, automobile repairing, needlework, etc., as well as carpentry among the orphans, so that each one may know a trade which will enable him to earn his own living.

Before the war there were in the neighborhood of 18,000 small cabinet-making or carpentry workshops in the Caucasus, employing about 127,900 people. There are over 10,000,000 acres in this region covered by forests, so that the lumber shortage bugaboo does not frighten the workers in wood over there. In Russian Armenia alone there are 850,000 acres of boxwood, walnut and other hardwoods. Bamboo, cork trees, chestnut, beech and oak are grown in great quantities as well. To show the part which the lumber and furniture business plays in Near East life, statistics say that $100,000,000 of wood articles were manufactured in the Georgian republic alone in 1913.

The seemingly limitless supply of wood has made the people more or less careless concerning their reserves, and there is little done in the way of an afforestation program. Wood is used as fuel largely, the peasants converting it into charcoal for that purpose. In the days of the old Russian regime, it was required that trees be built along the sides of canals and irrigation ditches in order to keep the earth in place, but today that system has been put aside.

HARDWOOD LUMBER

Making Overhead Shaft Oiling Safe

One of the most important jobs in a machine-shop is the oiling of overhead shafts, such as line bearings, countershaft bearings, loose pulleys, etc. At its best, it is a very dangerous job. It is usually done with a long-spouted oil-can and the help of a cumbersome ladder.

The illustration shows a better and saner method of oiling. Attached to the oiler's back is an air-tight box filled with oil, a hand-pump on the side supplying sufficient pressure to enable the oil to flow up through the rubber tube into the copper nozzle and from there into the machinery being oiled. The ladder is self-explanatory, and may be adjusted to any height by a simple raising or lowering of the pin seen under the man's feet.

How overhead shafting may be made safe

This device will save time and labor, aside from the consideration of its invaluable "safety first" principles.

Solution of Present Conditions

By M. Wulpi

The present situation in commerce is causing all to ask, "where will it all end and what's to be done?" One has one idea and another another, depending on the viewpoint. When all is said and done it comes down to "production." A lack of anything creates increased value, if there is a demand for it. Then if said demands exceeds the supply, the value is enhanced. Production today is so far below the demand that high prices is the inevitable result.

It, therefore, seems logical that increased production is the logical solution. Someone has well set up the following principles to secure it:

1. Greatest reward to all partners in industry will only come from maximum production, because production is wealth.

2. Maximum production can only be attained by co-operation of all concerned.

3. Co-operation is based on confidence. Without mutual confidence in industry there can be no co-operation.

4. Confidence is brought about by the practice of justice and fair dealings and by a realization by each of the justice and fair dealings of the other.

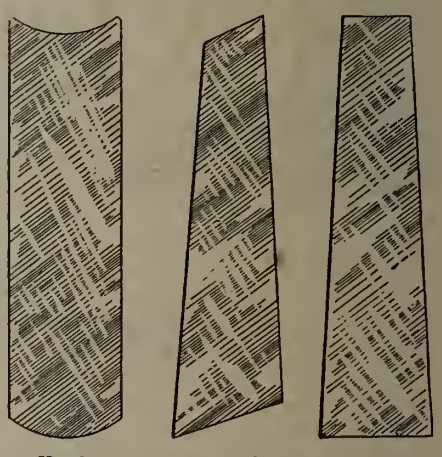
To boil it down: A realization of justice and fair dealing beget confidence, confidence promotes co-operation, co-operation brings maximum production and maximum production is greatest wealth of all.

These points are well to ponder over and then act.

Home-made Scraper Blades for Cabinet-makers

It will pay any cabinetmaker who has to do finishing to go to the trouble of making himself three or four narrow scraper blades similar to those here illustrated.

Three or four such scrapers can be made from one standard 6-inch scraper steel, and will be found useful in numberless instances where the ordinary wide steel is too wide or too large, or else improperly shaped to do the work. Often shallow depressions in panel work or corners can either not be reached at all with an ordinary scraper, or can be worked only with great difficulty. Rounded stock also is ill fitted to be worked with a square blade, and then again shallow rounded depressions need to be worked out where a gouge will not do because it cannot be easily controlled.



Handy scrapers made from saw blades or old scrapers

With the set of narrow blades shown, all these different jobs can be satisfactorily performed, Two advantages of these scrapers are that they offer an unusually good hand-hold. Owing to this and to the shortness of the cutting edge, four or five times more pressure can be exerted than with an ordinary wide blade. In difficult and awkward places this will be found to be of the utmost importance.

By the use of the rounded scraper the rim of a sink or other enamel or iron body can be perfectly scribed into a very good drain-board or table-top.

A cheerful foreman and a number of capable wood machinists make a very efficient and capable staff.

Hardwoods

Labor conditions and tight finances are making the lumber supply shorter than anticipated for the Fall trade. These conditions, together with a shortage of cars and an inevitable increase in freight rates of 25 to 30% should induce our customers to place their orders with us now, covering their Fall needs, and the stock will be shipped promptly—you will have it at your factory when you want it, and at lower prices than it can be purchased later.

Special Offers

1 car 4/4 Fas. Walnut (35 to 45% 10" & wider)
3 cars 4/4 No. 1 Common Walnut
1 car 5/4 No. 2 Common Walnut

PANELS

HAY & CO., Ltd., Woodstock, Ont.

News of the Trade

Dey Bros., Ottawa, Ont., boat builders, recently suffered a loss through fire.

It is reported that the Wagstaff shipbuilding yard at Port Greville, N. S., has closed down.

The A. & S. Furniture Co., Montreal, have been registered as manufacturers of furniture.

The Household Appliances, Limited, Montreal, were recently incorporated with a capital of $100,000.

The plant of the Progress Spring Bed Mfg. Co., Limited, Montreal, P. Q., was damaged by fire, recently.

The planing mill of Daniel Strong, Timmins, Ont., was completely destroyed by fire. Five buildings, in all, were wiped out.

The Kindle Bed Co., Limited, Stratford, Ont., are building a one-storey addition 88 ft. x 125 ft. Cost $30,000.

The London Petrolea Barrel Co., East London, Ont., are contemplating the erection of an office building at an estimated cost of $8,000.

The Tilbury Auto Body Co., Tilbury, Ont., are contemplating the erection of an auto body factory which is estimated to cost $40,000.

F. P. Quinn, of Kingston, Ont., has leased suitable premises from H. D. Buck at Norwood, Ont., and intends fitting it up as a furniture factory.

Hatfield & Lockwood, Canning, N. S., recently completed a 3-masted 400-ton schooner. It is anticipated that another vessel will be built at the same yard.

Regal Phonograph Co., Limited, Toronto, Ont., have been authorized by supplementary letters patent to increase their capital from $40,000 to the sum of $100,000.

The Broughton Hardwood Products, Limited, Caledonia, N. S., are installing a wodworking plant to manufacture hardwood products. A. W. Broughton is the manager.

The Eastern Handle & Dowel Co., Limited, Farm Point, P. Q., have installed two dowel machines, one sanding machine, one threading machine and one chucking and tapping machine.

The Grand Trunk Railway has commenced work on a dry kiln in connection with their car shops at London, Ont. The kiln is to be 80 x 40' and will cost in the neighborhood of $7,000.

The Acme Sash & Door Co., Limited, Winnipeg, Man., have received the contract for the mill and woodwork for the large store which Ramsay's Limited are erecting at Dauphin, Man.

The planing mill, carriage factory and blacksmith shop of W. G. Greenwood, Sault Ste. Marie, Ont., was completely wrecked by a gas explosion. The loss exceeds $7,000 with no insurance.

The Fisher Body Co., of Walkerville, Ont., have commenced work on their new body plant. This new factory is to be four storeys 92 ft. x 192 ft. and will cost in the neighborhood of $175,000.

The sawmill, planing mill, shingle mill and lath plant of Brooks, Bidlake & Whittall Co., Powell River, B.C., was damaged to the extent of $115,000 by fire. The loss is fully covered by insurance.

The Thessalon plant of Firstbrook Bros., Limited, Toronto, Ont., was recently put in operation and is busily engaged in producing shooks and boxes. About a car load of manufactured shooks is turned out each day.

The name of the Oakville Basket & Veneer Co., Limited, of Oakville, has been changed to the Oakville Wirebound Box & Basket Co., Limited, and the capital stock of the company increased from $100,000 to $500,000.

J. Coughlan & Sons, Limited, of Vancouver, B. C., shipbuilders, expect to launch Hull No. 18 in the near future. This vessel is to be operated by the Canada Western Steamships, Limited, a subsidiary of the Coughlan Co.

The Department of Public Works, Ottawa, is calling for tenders for fittings for the post office at Annapolis Royal, N. S. Bid should be in by Oct. 5th. Plans and specifications at Ottawa, St. John, Halifax and Annapolis Royal.

Bruce Woodworkers, Limited, Chesley, Ont., have been incorporated to manufacture and deal in all kinds of wood products. Capital $40,000. M. A. Halliday and George Durst are two of the incorporators, both of Chesley, Ont.

J. Donat Langeelier, Limited, Montreal, P. Q., have been incorporated to manufacture and deal in pianos, graphophones and other musical instruments. Capital $300,000. J. D. Langelier and J. E. Audet, both of Montreal, P. Q.

The G. T. R. plan on erecting a large car shop at Palmerston, Ont. A site has been secured and workmen are at work preparing it for the new buildings. It is anticipated that this work will be proceeded with at once and rushed to completion.

The Chicago Furniture Company, Chicago, Ill., are having plans prepared for what is claimed will be the largest office furniture factory in the world. The building will be three storey, giving a floor space of 400,000 square feet. The cost will total $600,000.

R. Howie, Limited, Toronto, Ont., have been granted a provincial charter to manufacture and deal in trucks, aeroplanes, boats, and other wooden vehicles. Capital $50,000. R. Howie and A. S. Oakley are two of the incorporators, both of Toronto, Ont.

The Milverton Furniture Co.. Limited, Milverton, Ont., were recently incorporated to manufacture and deal in furniture of all kinds, capital $200,000. The provisional directors are John Boshart, Enos Nafziger, Norman Honderich, Alvin Clemens and John Grosch, all of Milverton.

Don-O-Lac Company of Canada, Limited, Hamilton, Ont., have been granted a federal charter to manufacture and deal in varnishes, shellacs, fillers and all kinds of stains. Capital $50,000. A. B. Turner and W. Hazell, barristers, both of Hamilton, Ont., are two of the incorporators.

The Department of Education of P. E. Island has decided to establish a technical school in the Reena McLean Memorial Hospital Building at Charlottetown, P. E. I. The necessary equipment will be required. R. H. Campbell is the Superintendent of Education.

The Piercey Supply Co., Limited, Halifax, N. S., have about completed a new woodworking plant which they expect will be in operation in the course of a few weeks. They also contemplate erecting an up-to-date dry kiln 25 ft. x 100 ft. and a two-storey lumber warehouse 55 ft. x 100 ft.

The Stratford Mfg. Co., Limited, Stratford, Ont., are doing quite an export business. Recently a large shipment, made up chiefly of park seats, was made to New Zealand. A large number of orders have been received from South Africa and the prospects for this end of their business look exceedingly good.

The plant of Rankin & Co., Toronto, Ont., manufacturers of wood products and excelsior, was recently damaged by fire. Johnson & Son, patternmakers, who occupied the top floor of this building, suffered loss to the extent of $7,000 with $3,000 insurance. The total loss amounts to $15,000. The blaze started in the dry kiln.

The employees of the Hayes Wheel Co., Chatham, Ont., recently held their annual picnic at the Government Park. A programme of sports and games was pulled off, followed by refreshments. The employees present had a very enjoyable time. The members of the staff, who were recently laid off, wre included in the list of those invited.

The Rice Lake Canoe Co., who for many years have operated at Gore's Landing, Ont., have obtained a site and will erect a new factory in Cobourg, Ont. The new plant will be located near the new furniture factory of the Langslow-Fowler Co. Favorable shipping advantages, both by boat and rail, make the new location an advantageous one.

The planing mill and dry kiln of the Pearce Co., Limited, Marmora, Ont., were recently destroyed by fire. The loss is estimated at $25,000, and is partly covered by insurance. The future plans of this company have not been definitely decided on. In the meantime a nearby building will probably be equipped with woodworking machinery to take care of their work.

The Davie Shipbuilding & Repair Co., Limited, have completed the installation of the power plant and machinery in five wooden steamships. This completes the order placed with the Davie Shipbuilding Co., by the French Government. These wooden ships were built at the Lauzon shipyards and were then towed across the river to the Louise docks, where the installations were completed.

The Canadian Government merchant marine is rapidly extending its overseas service. There are 38 ships in commission with 28 more to be added to the fleet, and offices are being opened in Australia and New Zealand, and it is expected

Here is your future Superintendent.

Here is the Machine that helps you find Him.

Measure him by his time records on the International Job Time Recorder

International Job Time Recorder

No better way to test your men's value than to look over their time records as made on an International Job Time Recorder. Quick, accurate work and lots of it marks the hustling producer. Such a man will set a good pace as a foreman—he is the man you want. International Job Time Recorders print in clear, unchangeable figures the exact starting time and finishing time of any job or process.

They show you how much productive labor you are buying and how much non-productive time. They help you determine your costs. They pick out the winners on your working force.

Let us send you our latest folders.

International Business Machines Co.

LIMITED

F. E. MUTTON, Vice-President and General Manager

Head Office and Factory: 300-350 Campbell Avenue, Toronto

HALIFAX, 44 Granville St. ST. JOHN, 18 Germain St. QUEBEC, 506 Merger Bldg. MONTREAL, 1 and 3 Notre Dame St. OTTAWA, 190 Queen St. TORONTO, 409½ Yonge St. HAMILTON, 228 King St. E. LONDON, 489 Richmond St. WALKERVILLE, 44 Lincoln Rd. WINNIPEG, 227 McDermott Ave. SASKATOON, 254 3rd Ave. S. VANCOUVER, 110 Water St.

Also manufacturers of Dayton Scales and Hollerith Electric Tabulators

that the service will be extended to China and India. The rapid extension of this government-owned service should be a big force in the industrial life of Canada.

China is a buyer in increasing quantities for barrel shooks. The trade has expanded very rapidly owing to the big demand which has sprung up in recent years for Chinese vegetable oils. U. S. and Japan have hitherto divided this barrel shook trade between them. Dairen, centre of the bean oil industry, took the major portion, the remainder being imported by Hankow, Tientsin, Canton and Shanghai.

A recent Oshawa despatch states that a large American automobile company is negotiating for a site with the idea of erecting a large factory there. The new plant will be a big addition to the Oshawa industries and will give employment to a large number of men. A complete line of automobiles and trucks is to be manufactured. It is expected that a definite announcement will be made in the very near future.

The H. E. Furniture Co., Limited, Milverton, Ont., have about completed the new addition which they are adding to their factory. This building when finished will be used chiefly for storage and shipping purposes. The present plant will be reorganized so as to increase production, but it is not likely any new equipment will be added with the possible exception of a couple of saws for the shipping department, in the new building.

For the first seven months of 1920 Ontario's fire loss shows a substantial increase over the same period for 1919, according to a statement issued by Fire Marshal E. P. Heaton. Fire loss for the first seven months of 1919 was $5,842,536, while for the period of 1920 it had risen to $6,843,788, an increase of $1,001,252. On the other hand the fire loss for July, 1920, was only $676,297, while for July, 1919, it was $1,028,833.

The McLagan Phonograph Corporation, Limited, Stratford, Ont., has been formed with the same personnel as the McLagan Furniture Co., Limited, to take over the manufacture and selling of the McLagan line of phonographs. This new move requires a reorganization of the present plant, and while it is not anticipated that any new addition to the existing factory will be made, yet a certain amount of new equipment will be required.

A huge floating dry dock is being assembled in Toronto by the John E. Russell Shipbuilding Co. This drydock was built in Montreal and the sections are being towed to Toronto, where they are being assembled. Previously vessels requiring repairs weer forced to lay up either in Collingwood or at Kingston, but now the largest vessels can be handled in the new Toronto dock. The cost will run in the neighborhood of $75,000 or $80,000.

The Spiesz Furniture Company, Limited, Hanover, Ont., were granted a federal charter to acquire the business known as The Spiesz Furniture Co., Limited, (under provincial charter) and to manufacture furniture and all kinds of wood products, conducting in connection with the business, a sash and door factory. Capital $200,000. Two of the incorporators are J. J. Spiesz, manufacturer, and J. H. Adams, bank manager, both of Hanover, Ont.

The Quebec section of the Canadian Manufacturers' Association at a recent meeting decided to extend an initation to the Ontario branch of the Canadian Manufacturers' Association to visit the Province of Quebec during next month in order to extend the Entente cordiale between the two provinces. The party will be entertained at Sherbrooke, Three Rivers, Quebec and Montreal, and plans are under way for a tour covering many of the leading centres of the province.

The Vulcan Motor & Engineering Co., a well-known English automobile firm, is contemplating establishing a manufacturing branch in Canada, according to an announcement made by Walter S. Walker, general manager of the company. Mr. Walker is making a tour of the Dominion so as to gain an idea of general conditions with particular regard to Canada's ability to supply steel and other raw material required in automobile construction. The labor situation will also be given careful attention. He brought with him one of the newer model Vulcan cars.

The Burr Mfg. Co., Orillia, Ont., are working up a nice toy business. This industry, which was commenced a short while ago on a small scale, is developing fast and gives promises of growing to considerable proportions. The idea behind this new industry is dependable toys for children, that is, toys that will stand up under rough usage. The line consists of rocking horses, see-saws, kindergarten tables and other similar toys, and in addition staple articles like the wooden drums for electric washing machines, and various forms of woodenware are produced. The orders already booked will keep the plant going until next spring. Mr. Burr states that the present quarters are much too small and that he is contemplating moving his plant to another own.

Provincial factory inspection was discussed by the Canadian Federation of Labor at its meeting held in Hamilton recently. It was stated that in Ontario there are about 8,000 factory buildings that should be inspected and that only 11 inspectors were employed by the Provincial Department at this work. It was further stated that were these inspectors to work every day in the year, they would only be able to cover 3,422 plants, leaving 4,578 buildings uninspected. It was decided to request the Provincial Government to increase their staff of inspectors at an early date.

The Provincial Supply & Machine Co., Limited, St. Thomas, Ont., are placing a phonograph motor on the market, which is known as the Elgin motor. This motor, it is claimed, compares very favorably with the best on the market and is meeting with a strong demand. The company are equipped for quantity production and are negotiating several large orders. Mr. Anderson, the manager, is not a novice at the game, for he has been interested in the phonograph business since he placed the Sonograph on the market in 1902. At present the efforts of the company are confined to producing motors that at a later date tone arms, reproducers and other parts will be manufactured and some day a complete phonograph may be placed on the market.

The Westminster Shook Mills, Limited, has taken over the modern box plant of the Lumber Products, Limited, New Westminster, B. C. It is expected that the new firm will have this plant in operation in the near future. The Lumber Products' box factory has a capacity of 10,000,000 ft. of box shooks per year, and it is anticipated that the increased demand for box material from China, Straits Settlement and South America will take care of this output. Mr. R. L. Cliff, who is president of the new company, is a well-known New Westminster business man, and is president of the B. C. Manufacturing Co., Limited, The Pacific Mill Co., Limited, and Food Products, Limited. Mr. J. H. McDonald, who is associated with Mr. Cliff in the new enterprise, is the manager of the B. C. Manufacturing Co.

It is reported that the Canadian shipbuilders are asking for a subsidy on every ton of shipping built in Canada as a means of saving this valuable industry. Many of the Canadian shipyards have been operated at a loss and since the announcement by the Canadian Government that there will be no further extension to its shipbuilding programme, it has been felt that if this industry is to continue as a factor in the industrial life of Canada, it must be developed along lines that will insure stability and permanence. This industry got its start from the encouragement given by the Canadian Government during the war, and it is felt that it is in the best interests of every citizen of Canada that it be given every assistance. There are about seventeen yards affected, three in Nova Scotia, four in Quebec, six in Ontario and four in British Columbia. The total investment runs in the neighborhood of $50,000,000.

A $6,000,000 match factory is to be erected in the Province of Quebec by a company formed by the amalgamation of four large British match-producing concerns, together with an associated Canadian company. The management of the Dominion branch of this industry is to be in the hands of a directorate of twelve,—six Canadians and six British. Sir Lomer Gouin, ex-premier of Quebec, and George Chapoon, president of the Laurentide Paper Co., are to be two of the Canadian representatives. The president of the company will be Sir Alexander Maguire and the British directorate will consist of Sir Alexander Maguire as chairman; Col. Bouverie, D.S.O., representing the Vickers, Limited; J. Lever Tillotson, head of the leading cardboard box manufacturers in England; J. C. M. Jacobs, late manager of the Bank of Liverpool; Charles Gane, one of the leading timber men of London, Eng., and D. P. Maguire. It was stated that the equipment for this large plant lies in England awaiting shipment.

Personals

W. J. Mitchell, of Gelph, Ont., has been appointed manual training teacher of the Chatham Collegiate.

S. H. Lindsay, of Collingwood, Ont., has resigned the treasureship of the Collingwood Shipbuilding Co., and intends removing to Toronto. He still retains the position of secretary and will have his headquarters in the latter city.

J. E. Alain, managing director of the Victoriaville Furniture Co., Limited, Victoriaville, P. Q., passed through On-

Burning the Nation's Wealth!

Every hour of the day and night THE TORCH OF CARELESSNESS brings destruction to somebody's property in Ontario.

The Work of Fire Prevention should appeal to every Merchant and Manufacturer who wishes to preserve the continuity and non-interference of his business.

Special effort should be made during FIRE PREVENTION WEEK—OCTOBER 9 to remove all Fire Hazards and take every possible precaution to Prevent Fire

tario recently on a business trip to the Pacific Coast. Mr. Alain will visit most of the larger western cities before returning.

H. Schreiter of the DeLuxe Upholstering Co., Limited, Kitchener, Ont., was recently married to Mabel R. Moore, daughter of Mrs. Moore and the late Principal T. T. Moore of Acton, Ont. After the wedding Mr. and Mrs. Schreiter left by boat for a trip down the St. Lawrence to Quebec and other eastern points.

Clarence Hoard, president of the Bainbridge Lumber Co., of Birnie, B.C., was recently elected president of the Victoria Shipowners Limited. This latter company is a co-operative concern, which, with the assistance of the federal government, is building four lumber-carrying schooners at Victoria, B.C. The new company have made good progress in the construction of these vessels, three keels having been laid down at the Cholberg shipyards, and it is expected that the first of these will be completed by the end of the year. These vessels are to be operated in the lumber-carrying trade.

Obituary

John D. Collie, Brockville, Ont., superintendent of the Office Furniture & Supplies, Limited, recently passed away after a short illness.

Peter B. Burton, Toronto, Ont., recently passed away at Dundas, Ont. For many years he was a traveller with John Bertram & Sons of Dundas, and later acted as a representative for the A. R. Williams Machinery Co. of Toronto. For the past few years he has been manager of the Galt warehouse of the Canadian Machinery Corporation. He leaves a widow, one son and one daughter.

Books and Periodicals

"Furniture for Small Houses" is the title of a new book of furniture designs recently published by B. T. Batsford, Limited, of London, England. In this work the author, Percy A. Wells, has endeavored to apply artistic design to medium-priced furniture, and presents a large assortment of attractive, yet simple designs that could be made up with a minimum of labor and expense, and which would tend to beautify the smaller and usually poorly-furnished home. A large number of illustrations are included showing different interior settings, in addition to a wide range of living room, bedroom, kitchen and miscellaneous pieces of furniture. While the designs are typically English or, perhaps, Continental would be a better term, many of them would find favor in the Canadian market. Others contain ideas and suggestions that could be worked out and included in many of the regular lines in demand today. For the furniture manufacturer desirous of producing medium-grade furniture for the overseas trade, this work contains a wealth of ideas and suggestions. Copies may be had from the publishers, B. T. Batsford, Limited, London, England. The price is 12s 6d.

American Firm Cuts Phonograph Prices

The Vitanola Talking Machine Co., Chicago, Ill., have announced a reduction in the price of their machine, which they guarantee to maintain until Jan. 1, 1921. In announcing this reduction they state that in the face of a stoic belief one the part of the public that prices are bound to come down, many manufacturers are issuing letters stating their firm belief that the condition is only temporary, and that because manufacturing costs have not been reduced the prices of merchandise also will not be for many months to come. Our view of the situation is that in the end manufacturers will find that they are obliged to meet the public at least half way in its present frame of mind, even at considerable sacrifice, and since we do believe this is inevitable we, therefore, have decided to take the initiative in the phonograph industry. Notwithstanding the reduced list prices the margin of profit for the dealer remains as large as before.

Who Owns the Business?

Here is a man, for example, who owns and operates a large farm.. He bought it with his own hard-earned money; on it he works ten to fourteen hours a day.

Giving his whole time and strength to the work, he finds it necessary to employ three farm laborers to assist him in getting the maximum production.. He agrees with them for wages and pays what they are willing to work for.

But according to modern thinking, this system is all wrong.

These three men ought to control the farm, decide how much in money and produce should go to the theoretical owner and keep all the rest themselves. These men are giving their lives for the work. "If you deny them control of what they give their lives for, you deny them justice.". The owner is also giving his life for the farm, but of course that is different, he is capitalist, and exploiter of labor.

Does labor in and by itself give the right to control the profits? If men work on a railroad, does the fact of that labor itself give the workers the right to control the profits? Surely not, unless the labor itself furnishes a title to ownership. Is this true?

* * *

If you own a valuable gold watch and take it to a skilled watchmaker to be repaired, whose watch is it after he has repaired it?. Does it still belong to you, or does it now belong to the man who worked on it, by virtue of his labor?

To whom does the control of the watch belong? Does the man who worked upon it, by that labor gain the right to decide whether he will hand it back when you have paid his bill, or sell it and divide the proceeds with you?

* * *

The laborer surely has a right to a fair, even a generous, return for his labor. He has a right to reasonable hours and good working conditions.. But certainly his labor gives him no right to control the industry since it gives him no title to ownershp.

We are losing sight today of elementary economics.

We live under democracy, and it may be possible to nationalize the railroads by legislation.. We might then nationalize the mines and all other industries, finally nationalizing our farms and giving all the profits to the hired farm laborers.

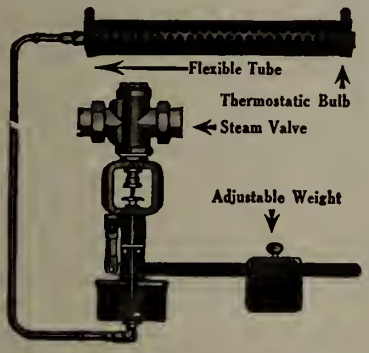
But let us be honest.

Let us not call it "industrial democracy," for "industrial democracy" is concerned with the welfare of all classes.

It is not even true Socialism.. It is really turning over the control and profits of industry to a single class in industry for the sake of that one class alone. We would call it American Bolshevism were it not that those whose doctrine it is have their feelings hurt when called Bolshevists.—Boston Transcript.

Automatic Regulation Is the Solution

Manual control of temperature never was satisfactory and dependable, even when it was cheap. What are you going to do about it, now, when wages are high and men are hard to get?



The Powers Regulator No. 15
Here is a regulator that will control your dry kiln, or your varnish room, or other similar process, saving fuel and improving product.

Automatic Heat Control is economical and always accurate. It insures better results at lower costs in the dry kiln, glue kettle, dry room, in fact, wherever temperature—liquid or air—must be maintained at a certain point.

Ask us about any process where you think automatic heat control would be an advantage. We will give you an honest answer to any problem of heat control you may have.

Robbing the Junk Pile

By V. H. Wilkes

Few persons realize the amount of material scrapped on the average construction job that could be salvaged if a little thought and study were exercised, which in these days of high prices and scarcity of material is worthy of consideration.

The writer, who has charge of the construction plant and storage yard for one of the largest engineering corporations in the East, was endeavoring to clean up the congested condition of its yard and discovered under some tarpaulins a number of kegs of nails which had been shipped into the yard upon completion of work and return of equipment, which were the accumulation of a number of jobs.

Upon investigation it was found that practically all were badly rusted and not fit for use in this condition. During the further investigation of the equipment an old 10 cu. ft. concrete mixer with gasoline engine was noticed which was in such condition that it would not mix concrete or pay to repair. After issuing orders to rettire this mixer to the scrap heap it was decided that the outfit might possibly be put to some use as a rattler or tumbler for the purpose of cleaning the rusted nails. Without cutting out any of the mixing blades or changing the drum in any manner about three kegs of nails, a quantity of iron borings and rough dry sand were put through the mixer with a result that approximately 3,500 pounds of nails were salvaged and have since been used on construction work. The machine was operated exactly as a mixer except when discharging a sieve was placed under the discharge chute which separated the nails from the iron borings and sand.

This plan proved so successful in cleaning the rusted nails that a considerable quantity of cast iron inserts, universal form clamps, bolts and numerous items have been cleaned and rescued from the junk pile.

If it is necessary after cleaning any material by the above method to store until such time as it can be used it is a good plan to put it through the machine the second time, using instead of iron fillings and a sand a quantity of sawdust saturated with a cheap form of oil which will oil up the articles cheaper and better than when applied by hand.

Disposal of Used Explosives Containers

High explosives are generally shipped in stout wooden boxes of convenient size, which are much sought after by miners and others for miscellaneous uses after they are emptied. The management of most mines has no fixed boxes and will allow any one to carry them away. Many dynamite boxes are nailed up in the mine buildings or underground to serve as shelves and cupboards. Some are used as receptacles for odds and ends, and others are used in taking samples.

Although used explosives containers are soon generally put to beneficial service, there is nevertheless an element of danger in their use, according to an authority. Dynamite boxes are particularly dangerous. Very often nitro glycerin exudes from the dynamite sticks and is absorbed by the wood of the box. Such boxes are dangerous because they are very explosive. Although a box that has not absorbed nitro glycerin is safe, yet there is always the danger that a person will get a box that is partly saturated.

On account of this danger, all mining companies should use extreme care in giving away used explosives containers. Some one individual who is acquainted with explosives and their peculiarities should act as inspector for every container given away. This job may best be handled by the man in charge of the powder magazines. A box that shows any stain of nitro glycerine should be destroyed by fire. The other boxes that are free from nitro glycerine or dynamite can be used.

The boxes that have been condemned, together with the paper linings of all boxes, should be burned in a place sufficiently removed from all buildings, preferably in a deep hole or behind an earth barricade. The boxes can be ignited by using an electric igniter or a fuse of appropriate length to spit fire into oily waste or excelsior.

Care should also be exercised in the disposal of black blasting powder kegs in which loose powder has been shipped. It is very difficult to get the last few grains and the dust of black powder out of the keg, and serious accidents have occurred by these kegs coming into the possession of children and others unacquainted with black blasting powder. All used black blasting powder kegs should be thoroughly washed with water before giving them away or putting them to use.

General Housing Plans

The 1916 census revealed the fact that the population of New Zealand was crowded into 32,000 dwellings. Since that time comparatively few new homes have been built and the population of the country has increased materially. The Board of Estimate in 1918 stated that there was a demand for at least 20,000 additional dwellings of four and five rooms each. The New Zealand Government has interested itself in the erection of homes for workers, and already the Government has 155 homes under construction, and provision has been made for the erection of 700 more. Besides this the different municipalities are attempting to aid in the matter of more and better homes for the wage earner, with the result that the New Zealand Government, the municipal authorities of the Dominion, and private enterprises are expected to supply 5,000 homes within the next year or 18 months. There will be no trouble in finding occupants for these homes at good rentals.

THE SHAPER MAN'S DREAM

THE KNOUREK PATENT

Ball Bearing Shaper Guide Collars

A Decided Improvement Over the Revolving Solid Collars Now in Use

Patent applied for

Ball-bearing Shaper Guide Collars are made with grooves as shown, for flat knives, and without grooves for solid steel cutters.

ORDER A SET ON 30 DAYS FREE TRIAL

The friction set up by stock or patterns bearing against solid revolving collars is entirely eliminated when ball-bearing shaper collars are used. Every shaperman knows the effect of this friction on stock being run, and so will appreciate the real value of these new shaper collars.

In the operation of the ball-bearing collar, the outer shell is free from the slotted collar proper and ceases to revolve with the spindles when pattern or stock comes in contact with it. It does not stop entirely but simply rolls along with the feed of the work. In this way there is no friction whatever between the collar and the work, therefore the edge surface can neither be burned nor worn down.

To save your patterns, stop spoilage of stock and in an easy manner, enable your operator to do more work, you should try out these new ball-bearing shaper collars —note the results by actual operation in your own plant.

Cut Miles without Grinding

A Characteristic Experience

Richmond, Indiana.

G. M. Diehl Machine Works,
Wabash, Ind.

Gentlemen:—

You may possibly be interested in an experience which we had recently in our factory with your Diehl Heads and Cutters.

Our Sticker man recently made a run of 10,000 stiles, each piece being 73 inches long, of hardwood, in which we cut a groove ¼ inch wide by 9/16 inch deep, and we made the entire run without taking the Heads or Bits off the machine and without resharpening, which makes a total run of a little more than 11½ miles. The Bits would, no doubt, have run quite an additional number of feet before it would have been absolutely necessary to sharpen them. We consider this a very good performance, especially in view of the fact that these stiles were all run from the rough wood and the Heads being used on a four-sided Sticker

Very truly yours,

RICHMOND FURNITURE MFG. CO.,
Per O. H. BRUBAKER, Manager.

J. M. NASH, Milwaukee, Wis.

COST REDUCER

That's what one of the users of the No. 147 Hollow Chisel Mortiser says about it. It will also reduce your Mortising costs and give you clean, square mortises in both hard and soft wood. Takes chisels up to ¾ in. and furnished with either plain or compound table and for either belt or direct motor drive. Write for price and circular as at present we can make prompt delivery.

Holds Heat and Conserves Current like a Fireless Cooker

"INTERNATIONAL" Electric Glue Heaters

Fireless cooker principle conserves and utilizes every bit of heat generated. Holds glue at correct working temperatures without guesswork. Average cost of operation about one cent per day. Keeps glue at correct temperature for greatest tensile strength. Properly glued joints never fail. This heater has a place in every shop and factory. Sizes, one pint to fifty gallons. Heavy spun copper construction. No seams or soldered joints. Three heats. No water bath. Clean, safe, economical. Portable. Fits any lamp socket. Used by prominent concerns everywhere.

Write for folder, "Correct Temperature in the Glue Room."

Fibre

First Quality Material for Fibre and Upholstered Furniture Manufacturers

Good Furniture is Only Made From Good Materials, Well Selected Carefully Handled and Inspected

In selecting your Fibre Cord and stakes for Fibre Furniture you can secure no better material than that which we produce. Our Cord is carefully watched throughout the entire process of manufacture and kept uniform in strength. It is giving perfect satisfaction.

Our Uniflax Seaming Cord for Upholstered furniture is unexcelled. It serves the purpose perfectly and lasts indefinitely. Prices for these materials are commensurate with the quality and are withal very reasonable.

GRAND RAPIDS FIBRE CORD COMPANY

1101-1157 Elizabeth Ave. **Grand Rapids, Michigan**

Boilers in Stock—Do You Need One?

Not often this opportunity presents itself. Quality and workmanship considered you'll never do better. Subject to prior sale—125 and 150 lbs. pressure—We have 72″ x 18′, 72″ x 16′, 66″ x 16′, 66″ x 14′.

A Record Service by
The "Eclipse"
SURFACE PLANER

With a record of over 2,000 in actual use and giving full satisfaction and perfect results the "Eclipse" Surface Planer is bound to be of interest to you. For the furniture factory it would be an ideal machine because of its ability to produce the highest grade of planing and most suitable where very thin, smooth work is required.

Write us for full particulars on our entire line of woodworking machinery of all descriptions.

The A. R. Williams Machinery Co., Limited
TORONTO, CANADA

Automatic Hole-Cutting Machines

The Wheel and Hole Cutting Machine has four automatic movements, all of which work in perfect unison, performing their functions in clock-like regularity.

The Hand-Hole Machine will cut hand holes in crate and box ends. It is worked by a carriage and levers, and will cut any size or length hole with either round or bevel edge in any kind of wood.

How do YOU Drive Nails?

Write for our Descriptive Literature

The Morgan Automatic Nailing Machine will prove a good investment for any woodworking plant. It drives nails anywhere and in any kind of wood, accurately, effectively and faster than it is possible to do it by hand. It makes money for Box Factories, Canning Factories, Cabinet Factories, Furniture Factories, etc.

44 Yates No. 275
30 and 60-in. Automatic
Knife Grinders,
Brand New, at
One-half Price

Machines arranged for Motor Application as per cut, or regular belt drive, if wanted.

8 New Andrew Mutiple Vertical Borers, 20, 30, 42 and 60-in., any number of heads.

7 New Hermance Molders, 8, 10 and 12-in., stationary and slip-on heads.

Band rip saw, Fay & Egan, 42-in.
Band saws, 32, 36 and 38-in.
Borer, Andrew, 10-ft., 13-spindle, power table.
Borers, Andrew mult. vert., 20, 42 and 60-in., new.
Carver, 5-spindle, Moore.
Door clamp, Fay-Egan, heavy.
Edgers, two, three and four saws.
Glue cookers and retainers. Glue spreaders.
Hogs, two, Mitts & Merrill.
Jointers, 8, 12, 16, 20, 24 and 30-in.
Knife grinders, two 32-in., F. & E.
Lathe, Ober spoke and handle, almost new.
Lathes, Mattison, No. 8 auto; No. 6 block mach.
Lathes, speed, eight, mounted on iron bed.
Lock-corner machine, Morgan No. 8, full set.
Matcher, American Northwest, 24x8-in., 3 sides.
Matcher, end, Sherman, fine condition.
Matcher, 24x6-in., 3 and 4 sides.
Automobile spoke machines, Defiance, complete set.
Band resaw, 50-in., Fay & Egan, tilting rolls, full set of filing room tools.
Molder, Smith 14-in. outside, latest style, practically new.
Molders, 4-side, 9, 10 and 12-in. American.
Molder, Fay & Egan No. 184, 12-in. outside.
Molders, inside, 13-in. American and Woods.
Mortiser and router, Fay & Egan No. 124.
Mortiser, chain saw, New Britain No. 1, 25 chains.
Mortiser, chain saw, New Britain No. 7, new.
Mortisers, F. & E. vertical, hollow-chisel; also plunger type.
Nailers, two, Morgan No. 8, used three months.
Nailing machines, 2 closed back, 4-track, 4d, 15-in. spread.
Pony planers, 16, 20 and 24-in.
Relisher and mortiser, Greenlee.
Rip saws, self-feed, Hoosier, F. & E., Greenlee.
Router for stair stringers, H. B. Smith, flexible arm with adjustable table and forms.
Sand belt, closet seat and similar work.
Sander, H. B. Smith, spindle and disc, practically new.
Sanders, 30 and 42-in. Columbia; 30, 42 and 48-in. Invincible; 30-in. double Invincible.
Saw, 8-ft. double cut-off, roller table.
Saws, combination and variety, single and double arbor, also tilting arbor, stationary and tilting table, 24 and 30-in. circular resaw.
Saw, circular re-slab, 40-in. blade, power feed rolls.
Shapers, Fay single-spindle reversible, also Shimer single with overhead routing attachment.
Surfacer, 30-in. double, cabinet, B. & M., practically new.
Surfacer, Whitney 30-in. double, sectional roll and sectional chipbreaker; American No. 4½, 36-in. sectional and solid; Fay & Egan No. 140, 27 and 30-in. double divided rolls; also 18, 20, 24 and 30-in. single cylinder panel planers.
Tenoners, B. & M. double-end, also several single-end tenoners with and without copes.
Timber sizer, Fay-Egan 48, 17x12-in.
Window frame machines, Smith & Phillips combination.
Wood-worker, universal, Fay & Egan and Bentel & Margedant. One lot of glue room machinery.

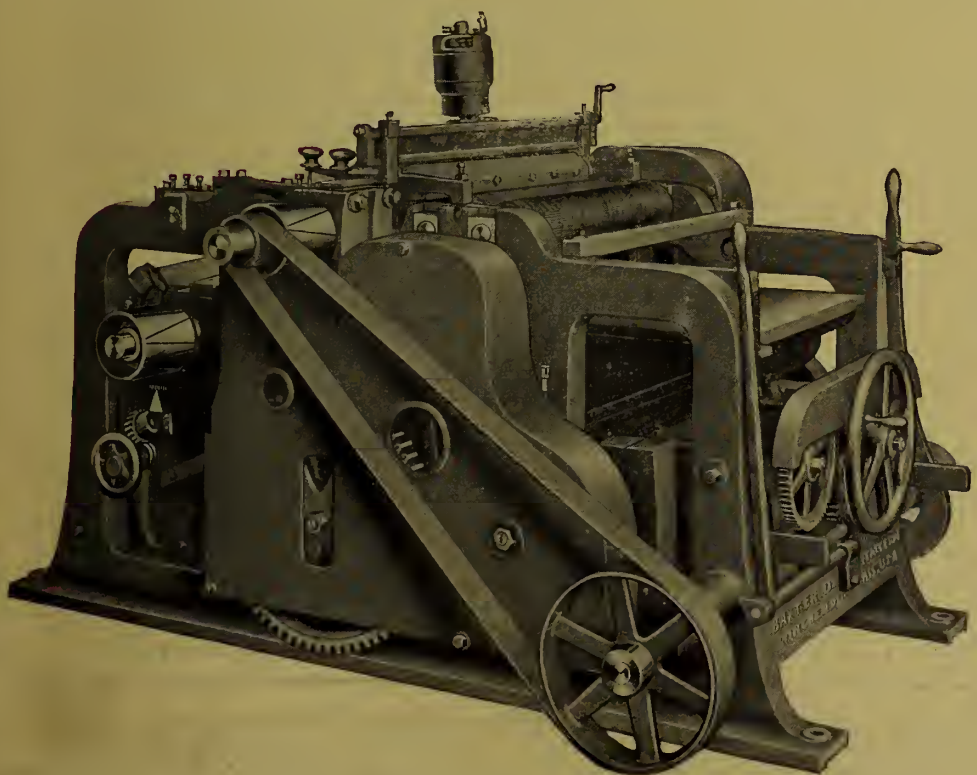
CANADIAN
WOODWORKER
and
Furniture Manufacturer

THE WHITNEY
No. 24 DOUBLE PLANER

is built to do the smooth and accurate planing required in Furniture, Desk. Chair and Cabinet Factories as well as Planing Mills and Box Factories.



These machines can be furnished with two or four-knife Square Cutter heads or four-knife Round Cutter Heads, Flexible or Sectional Chipbreaker and Motor-Driven Grinders and Devices.

Special Features

A Rigid Frame.

Bed raised and lowered on inclines.

Power hoist for bed.

Hardened Tables opposite cutter heads.

Automatic Chipbreaker.

Eight gear-driven feed rolls.

Two sectional infeed rolls.

Positive and powerful feed.

Clamp cutter head boxes.

Cutter heads with long bearings and large diameters.

Cutter heads belted at both ends.

Machine cut gears.

Lower head easily and quickly removed.

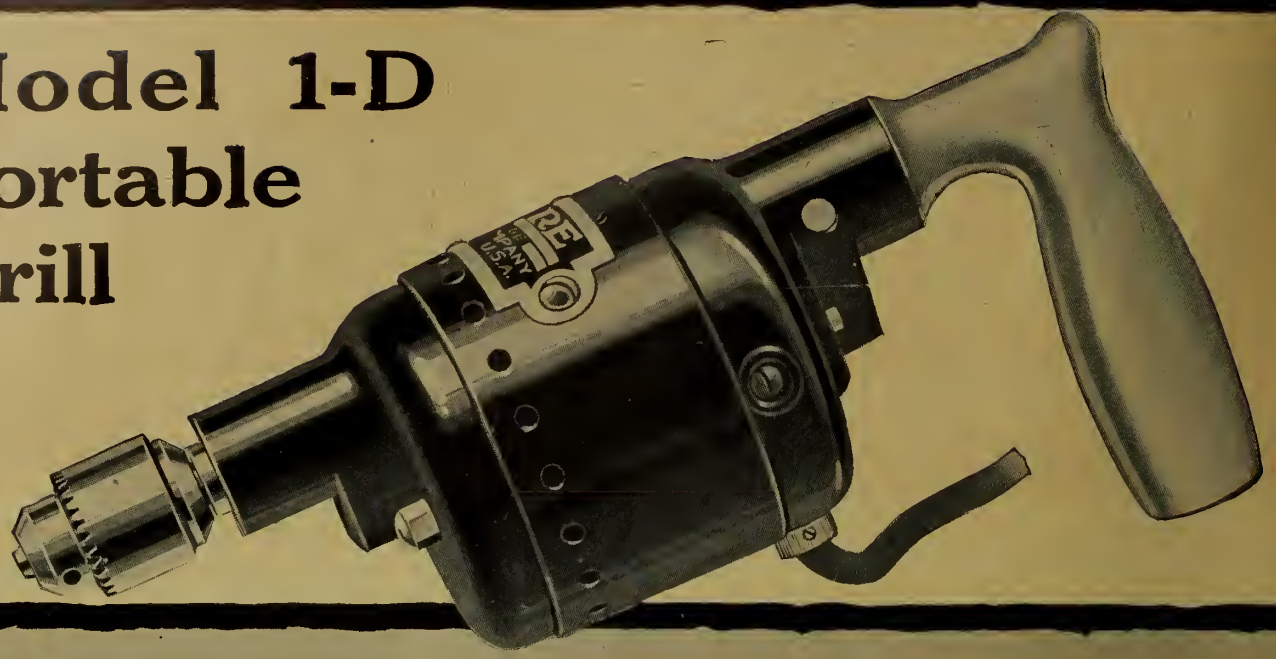
Model 1-D Portable Drill



HANDY—ECONOMICAL—EFFICIENT

Specifications:

Length—10 inches.

Weight—4¾ pounds.

Capacity—Steel, 0 to $\frac{3}{16}$". Wood and alloys, 0 to $\frac{1}{4}$".

Motor—Universal, on either direct or alternating current.

Diameter of Motor—3⅜ inches.

Spindle—Offset from center $\frac{31}{32}$".

Helical Gears.

Aluminum Handle.

Complete with 10-ft. cord, plug, switch and chuck.

Jacob's Chucks used as a regular equipment.

FOR speed in drilling and countersinking small holes, this tool is just what you need. It can be used on any kind of material—steel, iron, brass, aluminum or wood—and gives lasting service.

If your dealer cannot supply you with the Model 1-D, tell us about your requirements.

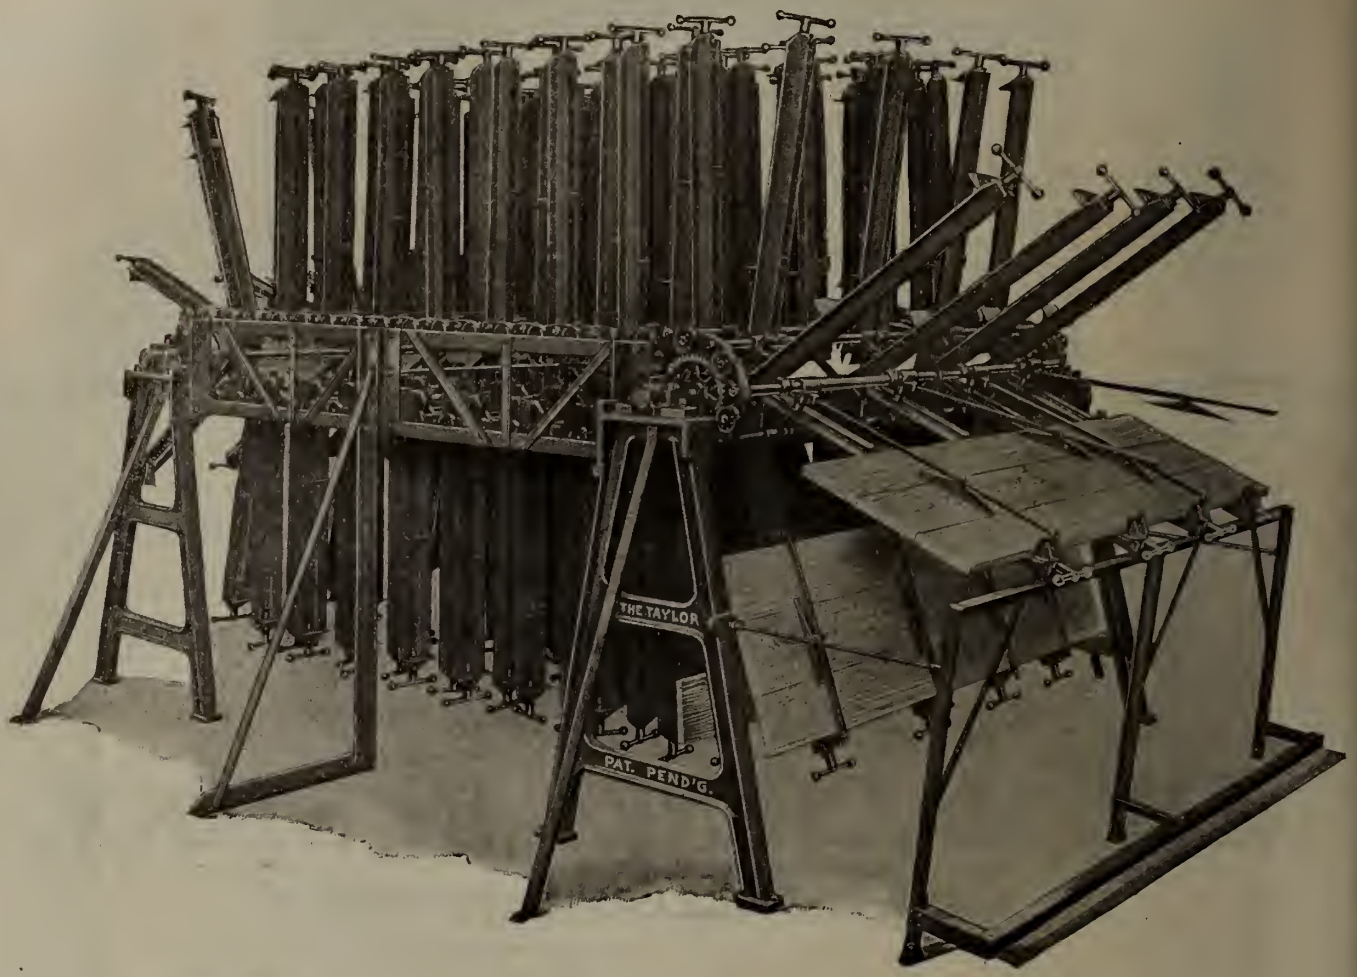
TORONTO

CLAMP The Taylor TRADE MARK CARRIER



Forty section machine carrying 160 clamps, measuring 8 ft. 2½ in. between shaft centers.

The clamp is one of the most interesting features of the clamp carrier. A remarkable strain can be applied with greatest ease; the work it turns out—both thick and thin stock—is 100 per cent. perfect.

An Engineering concern recently wrote:

"I am recommending Taylor clamps to the Germain Mfg. Co. because I have proven the clamps more efficient through scientific time studies on both and all existing types of gluing-up machines and devices."

As a result of the above recommendations, The Germain Mfg. Co. referred to bought two Taylor carriers. They installed them, and tested them and have since purchased two more. We can tell you numerous instances where customers are using from two to nine Taylor carriers each as a result of similar experiences.

Let us prove the truth of these claims by showing you one of these carriers in operation, or you can try the clamps out on your own work. Ask for C. C. Folder and further information.

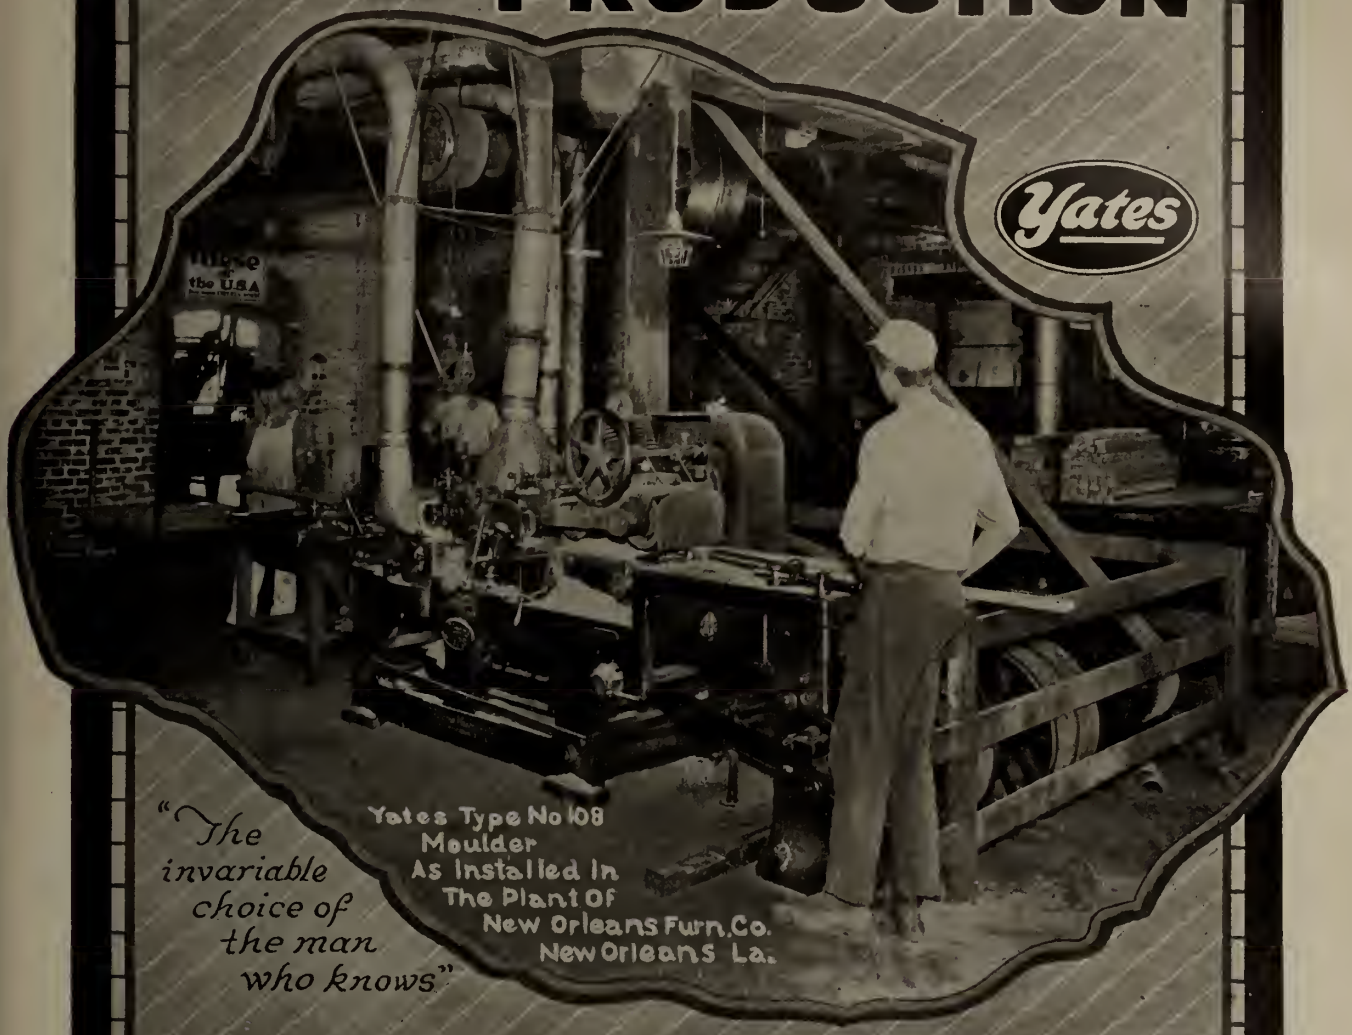
LESS MEN, MORE PRODUCTION



Yates
"The invariable choice of the man who knows"
Yates Type No 108 Moulder As Installed In The Plant Of New Orleans Furn. Co. New Orleans La.

The Yates No. 108 Moulder

is built for strength and speed and it sure does get the work out. Is just the machine progressive mill men are looking for. They cannot afford to be without a No. 108. This is the big reason. By actual tests, in many mills, under all conditions, the Yates No. 108 got out more mouldings and better mouldings with less men. Write a letter for detailed information and circulars.

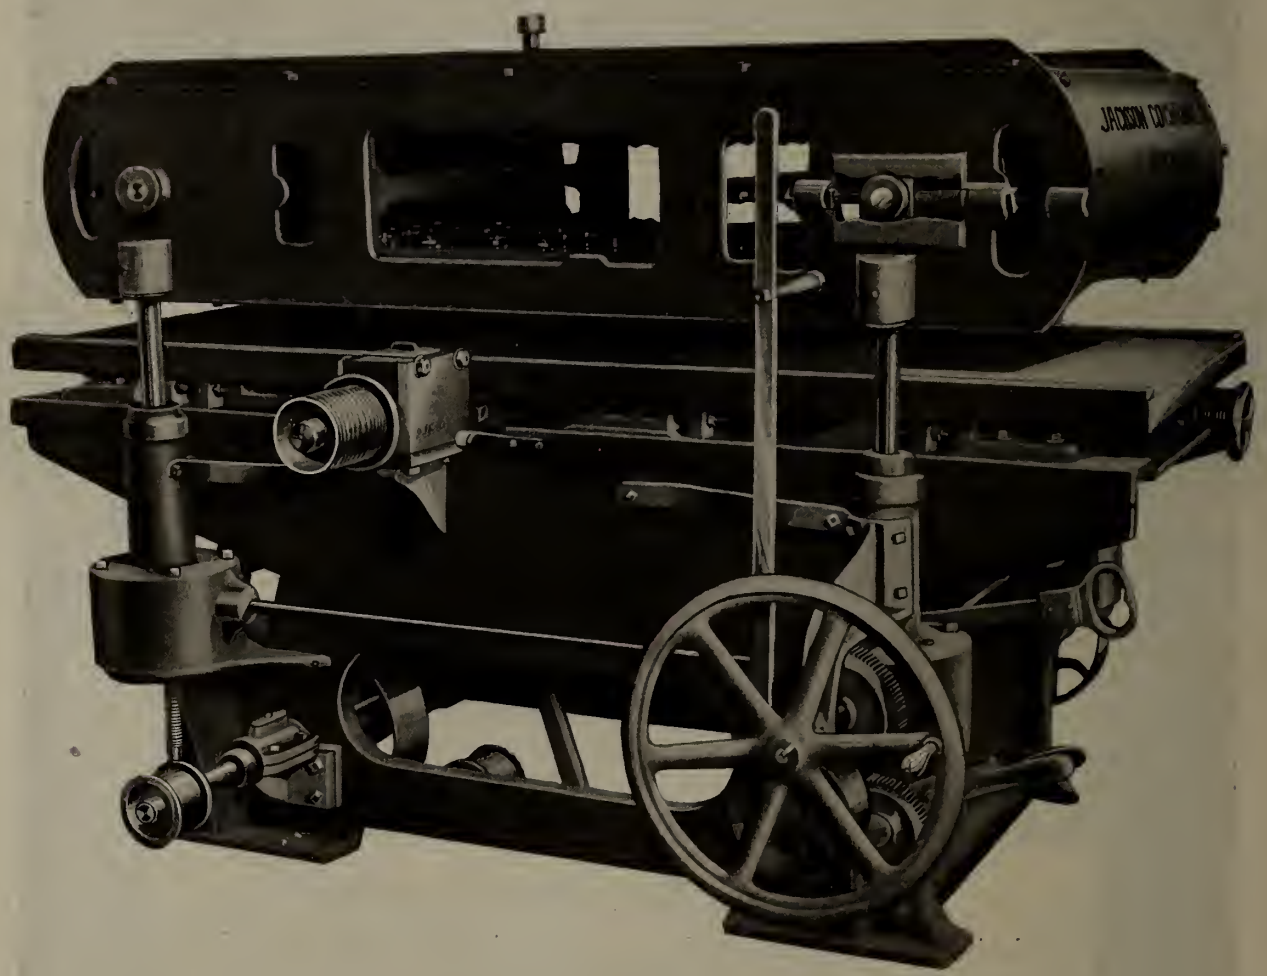
The Herzog Self-Feed Jointer

means

Increased Production
Small Floors Space
Simplicity of Operation
Safety to Employees

Does Four Times the Work of the Hand Jointer



Our No. 34 Herzog Jointer, illustrated above, is one of the most efficient machines on the market to-day. It is appreciated by the manufacturer and employees alike, because, while it will produce from three to five times as much work as the hand jointer, it does not require skilled operators, but eliminates the danger so common to other makes. It can be operated by two boys. It will handle stock varying in width from 1 inch to the full width of the jointer, will feed fast or slow, takes only one-fourth the floor space of hand jointers, and requires only one-fifth of the sharpening of the knives. It is fitted with power feed raising and lowering attachment, with cylinder double belted and driven from both ends.

If interested in reducing your costs, write us

Jackson, Cochrane & Company

KITCHENER - CANADA

The Shimer Round Safety Cylinder with High Speed Knives

A Round Safety Cylinder that will Appeal to the Buyer and the User for Three Reasons:

The first is our adjusting nut for setting the knives. It is the only cylinder with properly located adjusting nuts for setting the knives, which, with our way, can be set to 1-1000 of an inch.

The second is our way of holding the knife without tapping into the head.

The third is the correct angle of cut for the knives.

Made for Any of the Different Makers' Machines and in Any Length Cylinder.

The Elliot Bull Dog Planer

The illustration shows our new 16" x 6" Planer.

This Planer will fill a long felt want for a machine that will run from a 1½ or 2 H.P. Motor. It can be run from the Motor on an ELLIOT WOODWORKER, or from any other power by the addition of a counter-shaft.

We have eliminated all cut gears with which all other Planers are equipped, and drive the feed rollers with a worm gear thereby saving power.

This machine will do fine work and will soon pay for installation.

Write for prices and terms.

W. S. HAWKER.

Inventor and Designer of the World's most efficient Tubular Turning Machinery

THE

Money Maker Adjustable Rod

and

Dowel Machine

The machine that is sent under a guarantee to show you a gain of from 100 to 400 per cent. before you buy it.

The improved dowel machine that 90 per cent. of the largest and oldest machinery builders and dealers now endorse and recommend in preference to the solid chuck machines they themselves previously built.

One cutter head turns from 1/4 in. to 2 in. diameter.

Turns hard or soft wood equally well.

Handles heavy, oversized squares.

No choking of the cutter head.

Smooth stock.

Accurate sizes.

Works stock as short as five inches.

Rolls automatically centre variations in squares.

Machines built to turn from 1/8 to 6 in.

We want to hear from every user of a solid chuck dowel machine.

We can save you from one dollar out of every two, to four out of every five, that the operation of solid chuck machines costs you.

Engagements for competitive test solicited.

Formal orders not solicited. All sales made after demonstration.

The only question is, are you willing to cut cost of your dowel turning to one-half or one-third of what it costs with any make of solid chuck machine?

Machine delivers the goods before you buy.

State conditions of stock closely.

Special conditions require special equipment.

W. S. HAWKER MFG. COMPANY

DAYTON, OHIO.

THE DEFIANCE
No. 207 Steering Wheel Rim Shaping Machine

will shape both the inner and outer circles of STEERING WHEEL RIMS to any contour desired.

There is a DEFIANCE machine for every operation necessary in the manufacture of Steering Wheels—such as the bending, jointing, equalizing, polishing.

Illustrated and descriptive circulars covering these machines, sent upon request.

MIRRORS

GRAND RAPIDS QUALITY

Grand Rapids, Mich.

Largest manufacturers of high grade mirrors in America serving the furniture trade exclusively.

Indispensable—

Attached to Jointer

This is an invention that has rapidly reached a position of importance in every woodworking plant where it is used, in fact it is proving indispensable.

The "Quicsharp" Grinder

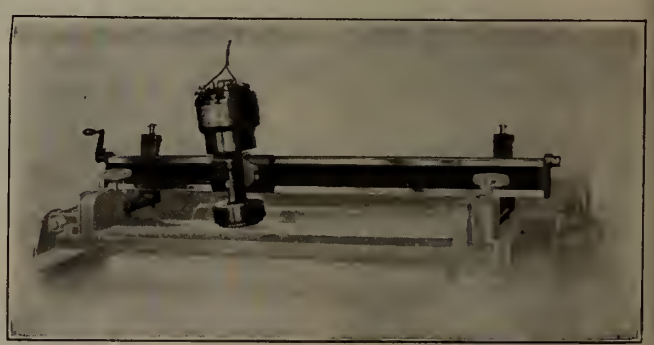
This machine has solved the grinding problem. The need for a machine that will quickly and accurately grind the knives of planers and jointers without the trouble of taking the knives off the machine, has for some time been recognized by users of woodworking machinery.

The Quicsharp Grinder is as simple to operate as safety razor, is adaptable to all makes and sizes of planers, is easily attached and light enough to be easily carried from one machine to another.

The Quicsharp soon saves its first cost,—and the expense of operation is light, being simply attached to the nearest lamp socket.

With the Quicsharp Grinder, knives are ground to a keen edge right on the machine in five to ten minutes, where it is usual for an operator to spend one half to three-quarters of an hour two or three times a day. With the Quicsharp Grinder in the shop there is no excuse for idle machines.

Send for complete details of this wonderful machine NOW while the question is fresh in your mind.



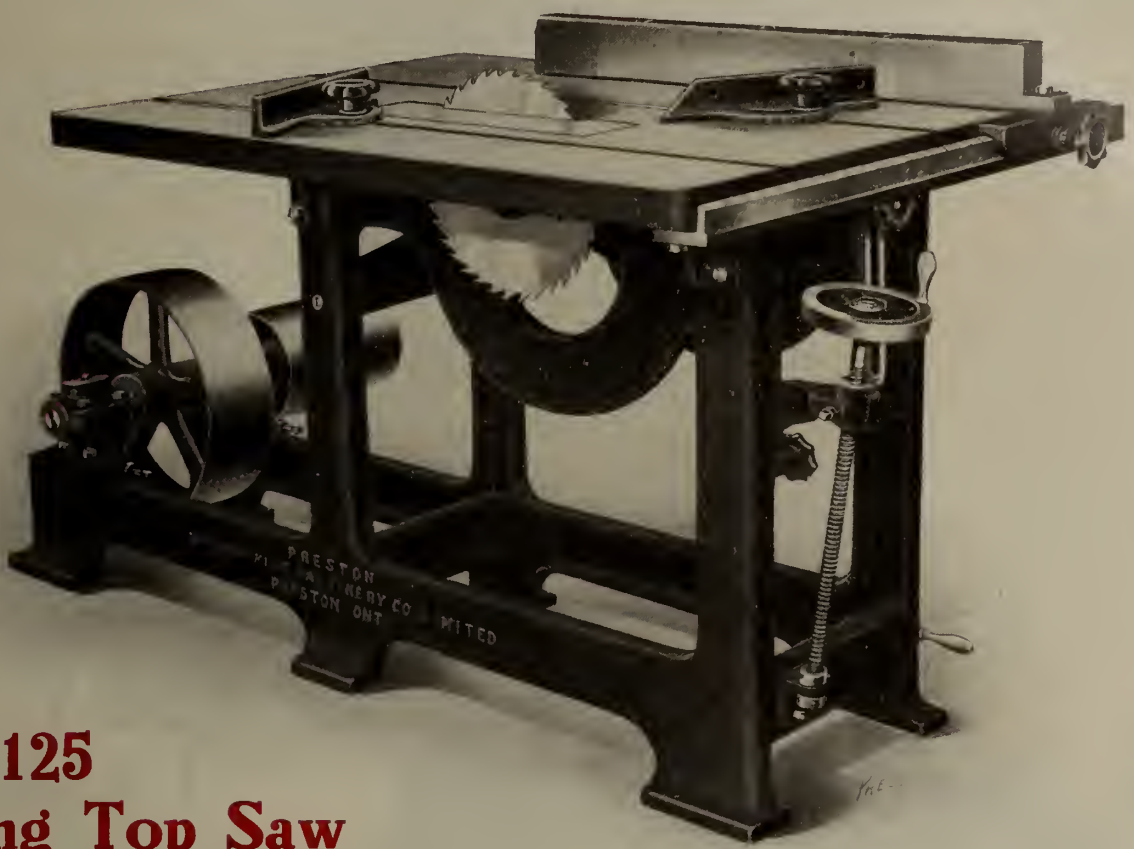
Attached to Planer

The

Preston Woodworking

PRESTON

You can always depend upon a "PRESTON" for quality



No. 125 Tilting Top Saw Table

A medium sized machine, well adapted for the Furniture Factory, the Sash and Door Factory, the Cabinet, Pattern and General Woodworking Shop. It is designed to give the greatest amount of efficiency and to take up as little space as possible.

The one piece cast frame makes it a substantial, rigid machine, and the easy and rapid adjustment of the saw makes it a simple matter to change from one operation to another.

For dadoing, grooving, bevelling, mitring and rabetting it cannot be beaten. You'll be interested in a complete description of this machine. Send for it.

6″ thick.

Feed Driven from Cylinder.

Upper Rolls 3″ Solid Steel.

Your Inquiries Solicited.

Cowan & Company of Galt, Limited

Galt, Ontario, Canada

Concerning the Hangers in your plant

ARE they fitted with ordinary friction-producing bearings that cut down production, waste fuel, and eat into your dividends?

And if so, are you aware that the large loss involved can be largely eliminated by installing S K F BALL BEARING HANGERS?

For with S K F Ball Bearing Hangers the shaft rides almost frictionless, not only when well aligned but also under extreme conditions of misalignment. The inner race tilts with the shaft—the bearing can never bind.

The economy of this feature of S K F Hangers is better appreciated when it is understood that in the average plant using line shafting for power transmission, friction destroys at least 25 per cent. of all the power produced or bought.

Other most important features of S K F Hangers are ***longer life, lower maintenance cost*** and a material saving in lubrication.

Canadian S K F Company Limited
Montreal Toronto

Transmission Hangers

A Service that contemplates more than the sale of a bearing

Every S K F Industries Service-salesman is a plant engineer equipped to consult on your power transmission problems. S K F Service made available through these men is built on a laboratory-backed ideal that seeks to increase Canadian output by lifting the friction load from industrial machinery.

Manufacturers are invited to avail themselves of this freely offered co-operation.

The S. K. F Research Laboratories where friction problems are solved

There is always a Demand for Lock Corner Boxes—*because*—

—1. They are the best package obtainable to protect your goods from water, air, dust, etc.

—2. Their strength and symmetrical design deliver a message of Quality that stimulates sales for the product they carry.

While the demand for this class of box is large, the supply is limited, because of the large initial investment heretofore required to manufacture them.

This obstacle has been overcome in the **No. 439 Lock Corner Machine**, which is sold at a price that enables every manufacturer to enter this field.

No. 439 works material up to 14″ wide and any number of pieces up to a total thickness of 10″. As one end only of stock is in the machine at a time any length may be worked.

MAGIC
VENEER TAPE

is made of highest quality Kraft Paper that peels off your veneer in one piece, thus eliminating that tedious and expensive work of sanding or scraping.

YOUR especial needs of Veneer Tapes, whether Paper or Cloth, can be furnished by

The Gummed Products Co.

Troy - Ohio

Chicago Minneapolis New York

Don't Worry!

Your troubles making veneer tapes work properly will be o'er, if you always use

Nashua Veneer Tapes

These tapes are heavily coated with glue, hold fast to the wood, and make a good hinge to hold the two edges of veneer firmly.

Nashua Veneer Tapes

are made in Canada by Canadian workmen. Our Kraft, Hollands and Coarse Cloth Tapes are made from the best of materials. Our trade mark is your mark of satisfaction.

Manufacturers and Wholesalers Northern and Southern Hardwoods

Northern Woods:

Ash, Basswood, Beech,
Birch, Hard Maple,
Quartered Maple,
White Maple, Soft Maple,
Soft Elm, Rock Elm.

Southern Woods:

Cherry, Chestnut,
Cottonwood, Cypress, Gum,
Hickory, Magnolia,
Oak, Poplar, Sycamore,
Walnut, Willow.

Please send us your inquiries and it will be a pleasure to quote you and describe our stocks

The above photograph was taken at one of our logging camps and illustrates the up-to-date equipment used in all our operations from the stump to the lumber in our yards.

The five Oak logs shown on the trailers are each 12 feet long and were all cut from one tree, the butt cut measured fifty-one inches in diameter. These five logs measured 6489 feet.

We operate two modern band mills on our own timber, and manufacture all the lumber we ship, which enables us to furnish stock of even grade, color and texture.

We will appreciate an opportunity of serving you and will be pleased to quote you at all times.

We are manufacturers of all kinds of high grade Southern hardwoods.

FAIR TREATMENT — that you can depend on getting

We would appreciate an opportunity of furnishing a portion of your lumber requirements.

"Hartzell's Choice Walnut"

The way Walnut comes to us

COMING AND GOING

One constant stream of American Black Walnut from "Stump to Consumer" flowing through a steady, reliable and satisfactory channel.

"Geo. W. Hartzell"

Logs in the rough coming in Veneers and Lumber of the highest quality going out daily year in and year out covering a period of 35 years.

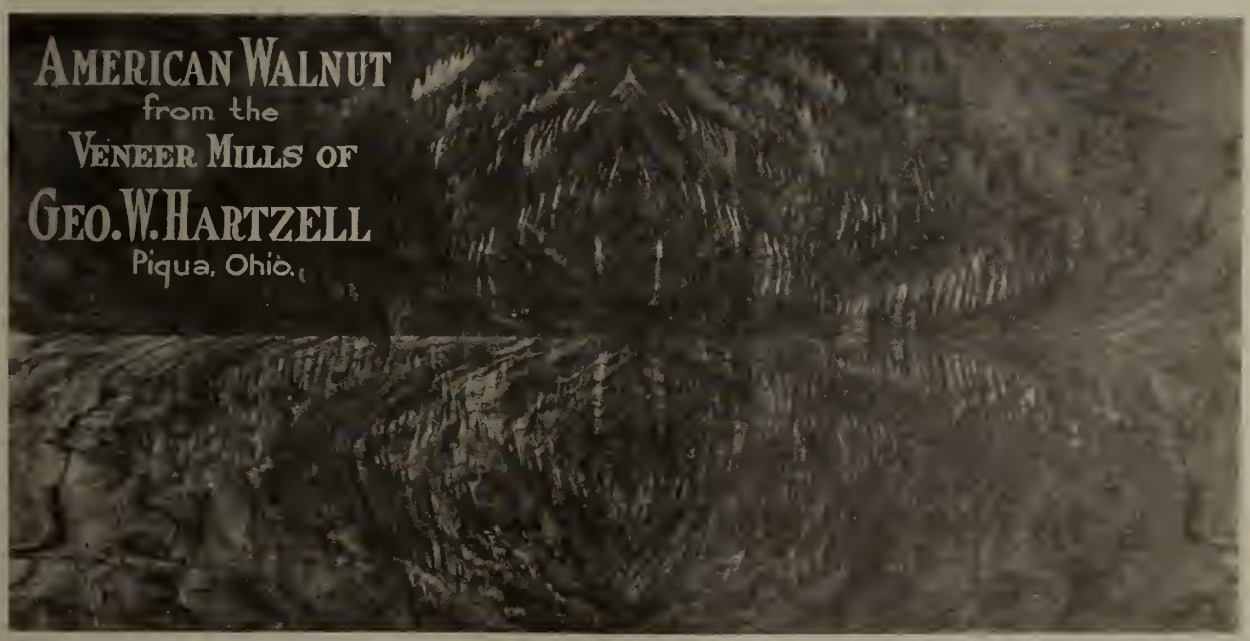
We rightfully claim your patronage because of "SERVICE and QUALITY," if there is any question in your mind about it

"Try Us and We Will Ship You the Convincer"

No Order too large, no Order too small to receive the close and careful attention it is our custom to give. That is a great part of our business, serving our customers.

"WRITE FOR SAMPLES AND QUOTATIONS"

Geo. W. Hartzell - Piqua, Ohio



The way it goes to our Customers

American Black Walnut

Enjoys World Wide Appreciation

In spite of most unfavorable rates of exchange, excessive ocean freight tariffs, and limited financial resources Europe wants America Walnut and is now buying. Europeans know walnut is the finest cabinet wood grown, and rightly refuse to consider substitutes.

Virtues of Walnut should be fully recognized on this continent as every phase of the cabinet wood situation today points out the advantage of featuring American Walnut.

All American Walnut is good but Iowa really affords the best.

We are prepared to supply you with
Walnut Lumber and Veneer

Des Moines Sawmill Company

Des Moines, Iowa

Glimpse No. 3 Into the Spirit of America's Second Greatest Industry

"Labor with a Smile is the Measure of the 'Boss.'"

Surmounting difficulties—riding over accidental troubles—meeting emergencies "head on" and with a grin of triumph which does not relax the set lips of determination—these are the test of a man or of an Industry (which, of course, is merely a mass of men).

Talk about "troubles"! The lumber industry, every man-jack of it, knows a lot about that word. Look at the photograph above. It is a recurrent, and unavoidable, episode in the hardwood industry. A vital logging railroad, on whose steady and efficient operation depends the prompt and sure meeting of your demands for an humble kitchen chair or a refrigerator, a luxuriously carven mantel, a neat baluster for the stairway of your new home (or the floors thereof)—the thresholds—picture-mouldings—heaven knows what that you never even think of—well, that elemental necessity was completely *washed out* by floods which no industrial mastery could forefend.

You can see the job those lumber boys are up against to rebuild that railroad and get it working again in a hurry. (And they seem to be enjoying this test of their skill and their organized devotion to *your service.*)

Let those of us who sit on *hardwood chairs*—in preference to metal or monoliths—and who delight in the varied arts of the cabinet-maker, study the photograph above and then enjoy our better understanding of the things that have to happen, and to be done by *somebody,* before we can relax in the comfort and security of home.

"Easy jobs" are hardly worth doing. Hardwood lumbering is no easy job. But it is worth doing. It must be done, and done well. You require it of us.

Write Us—and Watch This Publication for *Glimpse No. 4*

ASTORIA MAHOGANY
LUMBER & VENEERS

One of many steam vats at the Astoria Mills

Cooked!

After mahogany logs have been selected for veneer making, they are placed in huge vats and cooked with live steam for many hours before being sent to the veneer machines. Great attention is paid to this process, various logs being cooked for varying periods of time in order to ensure uniform softening.

The resultant uniform quality of mahogany veneer is one of the factors which, over a period of nearly half a century, have made us the largest complete mahogany lumber and veneer organization in this country.

We own our stumpage and operate our own band mill in Bude, Miss., manufacturing ten million feet annually, on which we specialize in Quartered White Oak, manufactured from genuine forked leaf White Oak and Yellow Poplar of fine soft texture grown in the hills of Southern Mississippi.

Our grades are dependable and the manufacture of our stock is unsurpassed. We respectfully solicit your enquiries, which will receive our prompt and courteous attention.

L. D. Murrelle Lumber Company

General Sales Office: 1524 Exchange Bldg., Memphis, Tennessee

Band Mill: Bude, Miss.

Stimson Veneer and Lumber Co.

(Inc.)

Office and Mill: McLean Ave. and Union Belt R.R.

Memphis - Tenn.

We sell only the product of our own mills and make band sawn lumber in all Southern Hardwoods.

We specialize in Quartered White Oak, Red Oak, and Red Gum.

With allied companies we make fifty million feet annually.

AMERICAN WALNUT

"The Cabinet Wood Superlative"

Little Doors That Open

(without sticking) after centuries of use.

There are little doors—and hidden drawers—that were fabricated 200, 300, 400 or more years ago. Some of them are supposed to open at the light touch of a delicate finger (with rare jewels on it). Some of them may stick (Oh, heavens!). BUT—*some of them are of WALNUT.*
The Walnut ones don't stick, nor jam.
Everybody is glad to know that cabinet-work of that supreme hardwood is still being made—by artisans who are indeed artists. Would you believe it? It is *true!*
Ask your furniture dealer—if you hope (as of course you do) that the furniture you buy today shall become the treasured heirlooms of your great-grandchildren.
"Walnut is Walnut"—there's no getting away from *that.*

The American Walnut Brochure, de luxe, is ready. May we have your written application? (Promptly answered.)

AMERICAN WALNUT MANUFACTURERS' ASSOCIATION
Room 1019, 616 South Michigan Boulevard, Chicago

ALL BRANCHES OF THE FURNITURE TRADE

are feeling strongly the Effects of the series of tributes to our American Walnut which are running continuously in most of the Best Publications in America. Above is an example.

THERE ARE STILL A FEW FURNITURE HOUSES IN THE COUNTRY

who are giving their better-posted competitors a great advantage over them with the Best Trade. WHY? Simply because they "heard somebody say" that American Walnut was getting scarce. *Let them ask us for THE FACTS!* (See address above.)

HARDWOOD LUMBER

Thirteen Band Mills
Six Planing Mills
Eleven Flooring Units

Annual Capacity,
130,000,000
Feet

About a million logs each year are cut into beautiful hardwood lumber on our saw mills.

These mills are located in industrial villages which we have built in the mountains, in the heart of the forest primeval.

We regret we are not able to give you a panoramic view of these ideal industrial villages. The surroundings and the plants make a delightful picture of industrial beauty and sylvan charm.

In these villages we have other interests than our plants and lumber.

There are good SCHOOLS and CHURCHES, which we liberally support. In order that the schools may be the best, we give thousands of dollars annually to supplement state funds to employ teachers.

There are COMMUNITY CLUB HOUSES, which we have built and turned over to the community. These are adapted to various pleasant uses.. They are used for theatrical and vaudeville entertainments, moving picture shows, pool, billiards and various other community diversions.

There are TENNIS COURTS, BALL GROUNDS, and provisions for other out-door games and recreations.

Incidentally, on the yard at every plant there is about 8,000,000 feet of choice hardwood lumber.

And because we have superior mill villages, and give our employees superior treatment, and receive superior service from them, we are able to give our patrons

Goodyear Klingtite Belts saving power in the flour mills of Korea

World-Wide Acceptance of Goodyear Belts

THERE is a world-wide acceptance of the Goodyear Belting which dominates in Canadian industry.

This direct endorsement of the Goodyear principles of manufacture and application gives us no little pride. It means that the technical men of the world see eye to eye with Canadians in the matter of economical and satisfactory power transmission.

But it means much more to Canadian industry. It means a world-wide fund of data for the Goodyear men who advise with you on belting problems. It means that the cotton spinners of Lancashire, the silk manufacturers of Lyons, the steel plants of Sweden, the shipyards of Seattle, the flour mills of the far East—all will contribute their experience to help solve power problems in Canada.

In order to meet world-wide market conditions it has been necessary to change some of the familiar Goodyear brand names—but the change is in name only.

For example, Goodyear Extra Power Belt is now Goodyear Klingtite Belt, and when the Goodyear belting man specifies Goodyear Klingtite for a certain drive you are getting the old Extra Power in every particular.

Ask any Goodyear branch to send a man who is making transmission problems his special study No obligation. Phone, wire or write.

Furniture Industry on Aggressive

A step of far-reaching importance to the furniture and allied industries was recently taken by the furniture manufacturers in the inaugurating of the nation-wide campaign, which is now in full swing, to increase the demand for good furniture. This comprehensive scheme, which includes active, aggressive work in several different fields, is being carried out through the agency of the Home Furnishings Bureau, an organization created for this specific purpose.

The object of the movement, which is described in detail elsewhere in this issue, is primarily to enlarge the market for furniture by arousing a greater interest on the part of the home owner and home maker, both present and prospective, in attractively furnished homes. There never was a time when more interest was being evinced in this subject than the present. By showing the home makers how the home can be made more comfortable and more attractive, educating them to the beauty and desirability of good furniture, and convincing them that good furniture at present prices is, in comparison, cheaper than nearly all other commodities, and is not likely to decrease in value, the furniture maker should be able to arouse a strong desire for better furniture.

There is no question as to the value of publicity. It has worked wonders in other fields and for other commodities. Advertising, persisted in, can increase the demand for furniture. An appeal to the home-loving instinct, which is so strongly implanted in the breast of the average Canadian, should have exceptionally gratifying results.

However, a note of warning might well be sounded. Immediate results should not be expected from a campaign of this kind. It is here where the danger lies. It takes time to mould the tastes of the buying public, but when once accomplished, the results will be worth the time and money expended. Many schemes of co-operative advertising have been launched with great enthusiasm and loud acclaim, only to die a natural death through lack of support by those directly interested The furniture industry is experiencing a quiet period and some may think that the advertising being carried on should result in maintaining the demand. It is too early in the campaign for direct results to be noticeable. In addition, the natural tendency when business is slack to reduce expenses by curtailing all expenditures. The campaign to arouse greater interest in home furnishings should not be allowed to founder for lack of support, for it is bound to pay handsome dividends.

The appeal, that is being made, is along general lines, and is not intended to boost any particular line or style of furniture. Better furniture and better furnished homes is an appeal for better home surroundings, better than each individual now enjoys, so that all furniture manufacturers will benefit by the increased volume of business that, through time, will assuredly result.

A prosperous furniture industry means more business, not only for the furniture manufacturer but for the manufacturer of lumber and woodworking machinery and of all the material used in furniture making. It is then in the interests of all concerned that the furniture manufacturers be encouraged and in some way assisted in this aggressive publicity work.

New Freights and Box Manufacturers

The recent increase in freight rates tends to emphasize the importance of a properly designed container, whether box or crate. The modern box should be built to designs and specifications that will ensure the following requirements: maximum service, safety to contents, low rates and reasonable first cost.

"Service" has of recent years become a very important factor in the box-making industry. Some of the larger box men have established testing and designing departments, manned by experts whose duty it is to study boxes under severe test conditions and to apply the knowledge so gained to the peculiar needs of different industries and various products. Others have consulted and co-operated with the Forest Products Laboratories at Madison, Wis., in an effort to improve box design and construction.

The results and findings of many of these tests have been published from time to time in the Canadian Woodworker. This information should be of real value as a guide in assisting the box maker to help overcome the increased burden placed on all shippers by the 40 per cent. increase in freight rates. It is more essential than ever that a box should contain just the right amount of material, so put together and perhaps reinforced, to ensure a safe arrival of the contents. More than is necessary is waste and adds to the cost of the box. In addition an extra pound or two, due to unnecessarily heavy material in a container takes on added importance when the higher rates are considered.

How Home Building Costs May be Reduced

Millmen Should be in Position to Advise Customers—Built-in Features of Modern Kitchen Cut Down Costs—Most Important Department in Home

By W. H. Shaw

Successful home building to-day has come to mean more than the erection of four walls and a roof for a shelter. The real home is not only the result of study of the basic principles of construction but the outgrowth of a thorough sympathy with certain new factors affecting the inside life of the home. Electricity, inventive genius, and the housekeeper are three influences that have brought about a great change in construction ideas.

So persistently have these influences enlarged their radius of activity that even the architectural scheme has been moulded to new forms. Time-worn methods have disappeared and we find the home taking on a new aspect. We are living in an age of convenience; therefore, contractors and builders should see the importance or even necessity of building well-designed, well-equipped, drudgeless homes for their customers or prospective buyers.

How Saving Can Be Effected

How many building contractors realize that the prospective home owner can get a modernly equipped kitchen free and also save many extra dollars in construction costs of the new home—if he will plan his kitchen from the start to make use of all modern conveniences? The builder to-day is confronted by high costs in material and labor. He knows that this is the reason some of his best prospective clients are hesitating to build. Any suggestion therefore that will cut the building cost without taking away any of the modern conveniences, will be very welcome.

It may be that the bungalow idea in our homes has been a material help in making the kitchen a more notable factor in our home building. While the kitchenette, with its compactly planned, and often cramped space, is not always to be desired, yet the idea is one that has met with general favor and we find that with some modifications and variations in form it is present in many modern homes.

The kitchen cabinet is a substitute for the old-fashioned large pontrees, permits of economy in construction, throws one big item of expense over from construction to equipment cost, and also gives the housewife a kitchen which is more satisfactory to her. Considerable space can be saved by concentrating cupboards, pantries and china closets right in the kitchen to match in with the other woodwork of the room, especially is this true where a breakfast room is next to the kitchen and one cupboard built in the wall, provision having been made with wider studds, will serve as a cabinet for both rooms. The important thing for the builder is to plan and build his kitchen in such a way that the proper space is provided for these pieces of built-in furniture. These spaces should be properly located with respect to good light, position of sink, kitchen range, etc.

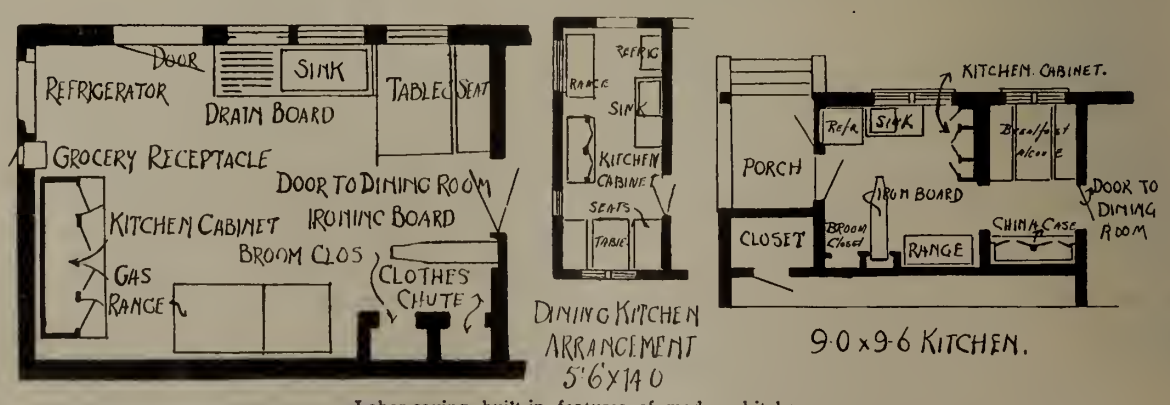
Every Foot Saved Counts

In these days, when every square inch of space inside the new building has to be figured, this saving in construction cost is a large item, to say nothing of the increased convenience and satisfaction which the head of the house who presides over the kitchen will enjoy when the modern kitchen equipment is installed.

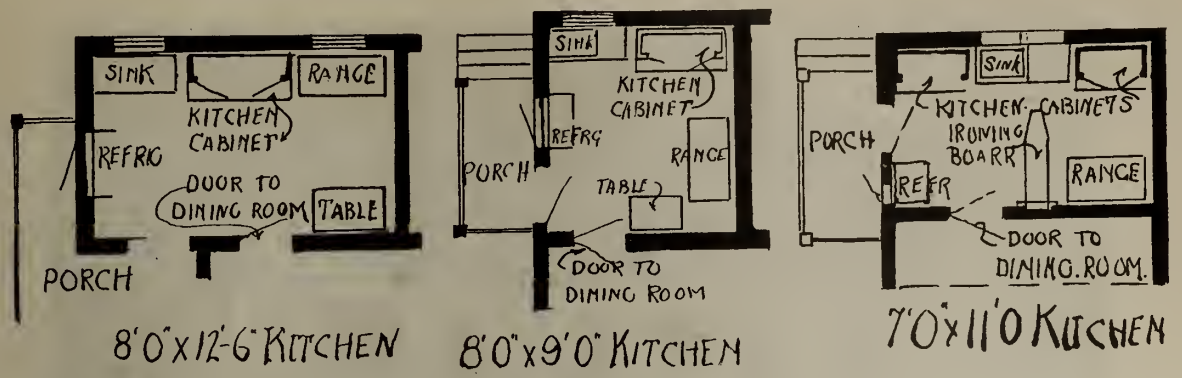
Contractors to home builders and also speculative builders, putting up homes in quantities for sale to meet the present critical housing shortage, must take advantage of these ideas which will hold down the expense and at the same time give them a real talking point for the sale of their houses. For it is a well known fact women look at first and scrutinize closest, and when it is all considered it is the women folks who are the real buyers of the homes.

Apartment buildings and apartment hotels are coming to the front in many localities and in these also every square inch of space is at a premium and must be used to its fullest extent. The "stock" kitchen cabinet is usually standard equipment for apartments, and space saving dwellings of every kind.

This is the age of ready-made products, ready-to-wear, ready-to-use. While it is never—well, hardly ever—quite what one individually desires, yet it saves so much thought, and thinking is such a laborious process, that many people are willing to pay the extra price and be satisfied with less in results. In times past it has been easier to buy a kitchen cabinet that nearly fits requirements than to build one and take



Labor-saving built-in features of modern kitchen



Construction costs lowered through proper planning

the responsibility of creating such an article as one wants, and many an enthusiast has accepted the line of least resistance.

Advantages of Kitchen Cabinets

If stock cabinets are planned to be used, successful planning of a kitchen in this manner calls for active co-operation between the builder and the manufacturer who produces kitchen cabinets. From the kitchen cabinet maker the buider gets his information on the sizes and details which enables him to go ahead and figure intelligently on the size and layout with the kitchen cabinet included. The cabinet manufacturer, on the other hand, will welcome advance information about new home building under construction.

The good points of the modern kitchen are its step-saving arrangements on a limited floor space and its cheerfulness, due to light walls, woodwork, etc. Cupboards are usualy planned to utilize every availaable space, and cupboards close to the ceiling and floor do this. All sanitary ones have doors to keep out the dust. Special cupboards for dishes, cooking utensils, provisions, ironing board, cleaning utensils such as a broom and mop, and a cooling closet are desired by most women.

Modern efficiency lays special stress on concentration, and the assembling of the equipment for each part of the work. A little study of the plans given in the different parts of this series, shows the concentration of each feature of the work, and the relation of one part to the others. The sink, the cabinet, the range, the ironing board, the refrigerator, etc.

Progress, supply and demand, are agencies ever at work and sometimes a glance backwards brings a realization of the change that is steadily going on. To-day everything is being done in a different way. A glance at one of the old colonial kitchens will prove to the house builder that much progress has been made in this part of the house. In the first place, the activities which in olden times centred in the kitchen have been separated. The laundry work in the majority of cases is done in a room by itself. The family eat in a room apart—unless it be a breakfast alcove, instead of one end of the kitchen, as was the custom. Refrigerators now care for food, and the large pantries for storage of large quantities of dishes and supplies has now been forsaken and all exchanged for the modern beautiful kitchen with its white enamelled sidewalls and woodwork, linoleum covered floor, electric range, and one-piece sink, set high enough to avoid backaches, modern, well designed kitchen cabinet with its up-to-date flour and sugar bins, is surely an evidence of the progress made in the improved "workshops" of the well planned modern house of to-day.

New Association of Wood Users

The Association of Wood Using Industries was formed in Chicago on September 29th. This organization is made up of the various national and district trade associations of those engaged in the remanufacture of wood. The object of the new association is to co-ordinate the energies of the different wood-using industries, together with other public or private agencies, so that there may be adopted and put into execution a definite form of reforestation, protection of existing forests and conservation of the products of the forests. With the increasing scarcity and higher costs of lumber, active steps must be taken to insure an adequate supply of raw material if the wood-using industries are to continue to exist.

The members of the new association will comprise representatives from all industries other than those engaged in the cutting of lumber, and should be an important factor in determining the reforestation policy of the American government. The following officers were elected:—

President—Mr. E. E. Parsonage, of the John Deere Plow Co., Moline, Ill.

Vice-President—Mr. Hugh P. Baker, of the Book Paper Mfrs. Assn., New York, N.Y.

Secretary—Mr. W. D. Baker, of the National Furniture Council, Chicago, Ill.

Treasurer—Mr. F. A. Vogle, of the Tanners Council of U.S.A., Milwaukee, Wis.

Executive Committee—Officers of the Association and Mr. W. A. Babbitt, of the National Association of Wood Turners, South Bend, Ind.; Mr. W. Harry Davis, of the National Association of Egg and Egg Case Filler Mfrs., Chicago, Ill.; Mr. John Foley, of the American Wood Preservers Assn., Philadelphia, Pa.

Twenty-five associations were represented at the meeting and many others have expressed a desire to actively participate in the organization but were unable to be represented.

A saw specially sharpened and set will not give satisfaction if the belt that drives it is not the master of the saw.

A well balanced cutter block makes a harmonious sound.

Attractive home embodying novel ideas

House Built For Simplified Housekeeping

Living and Sleeping Quarters on One Floor—Results in Greater Convenience and Comfort—Every Effort Made to Conserve Steps and Labor—Many Built-In Fixtures

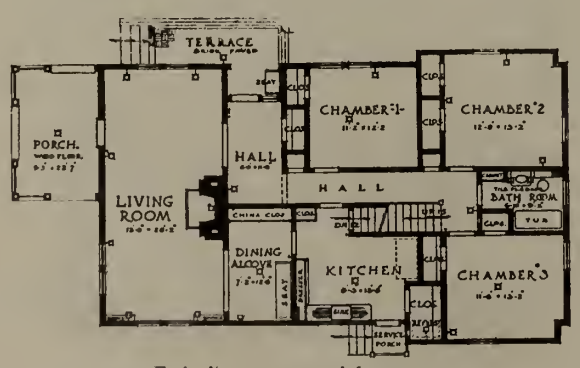
By G. H. Williams

Every family that contemplates living outside of the great centres of population is today faced by the baffling problem of domestic help. Women are asking themselves, more and more, "How can I give my children the benefits of living out of town and have a household that I can manage unassisted?" This was the dominant thought in designing the house shown herewith. Mr. L. G. French, the owner of this residence, himself an engineer, and editor of the Journal of the American Society of Mechanical Engineers, naturally had some very definite ideas of his own on the subject. The architect has worked these out admirably.

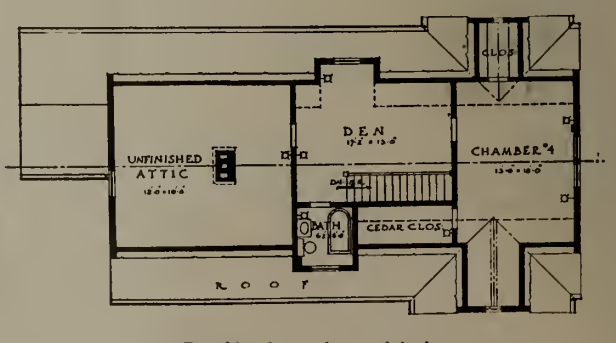
The solution adopted was to place all the rooms necessary for the everyday needs of the family on one floor, giving over the upper storey to those rooms that have only occasional use. The first floor is arranged with two distinct parts Living and sleeping quarters, so divided that each may be independent of the other.

To simplify dining service and avoid the maintenance of a separate large room, a dining alcove has been built off the living room. In it is a large built-in dresser for china, linen and silverware, which though a step from the dining table, is nevertheless concealed from the living room. Should it be desired to entertain a larger number of guests than can be seated in the alcove, the table is readily moved into one end of the living room, which has been made long for the purpose, and is still in close contact with the kitchen.

The kitchen has been arranged to facilitate the preparation of food and the washing and putting away of the pots and pans with a minimum of washing. A dresser is placed next to the drain board of the sink and pots and pans may be placed in it as they are dried, without preliminary stacking up. The refrig-



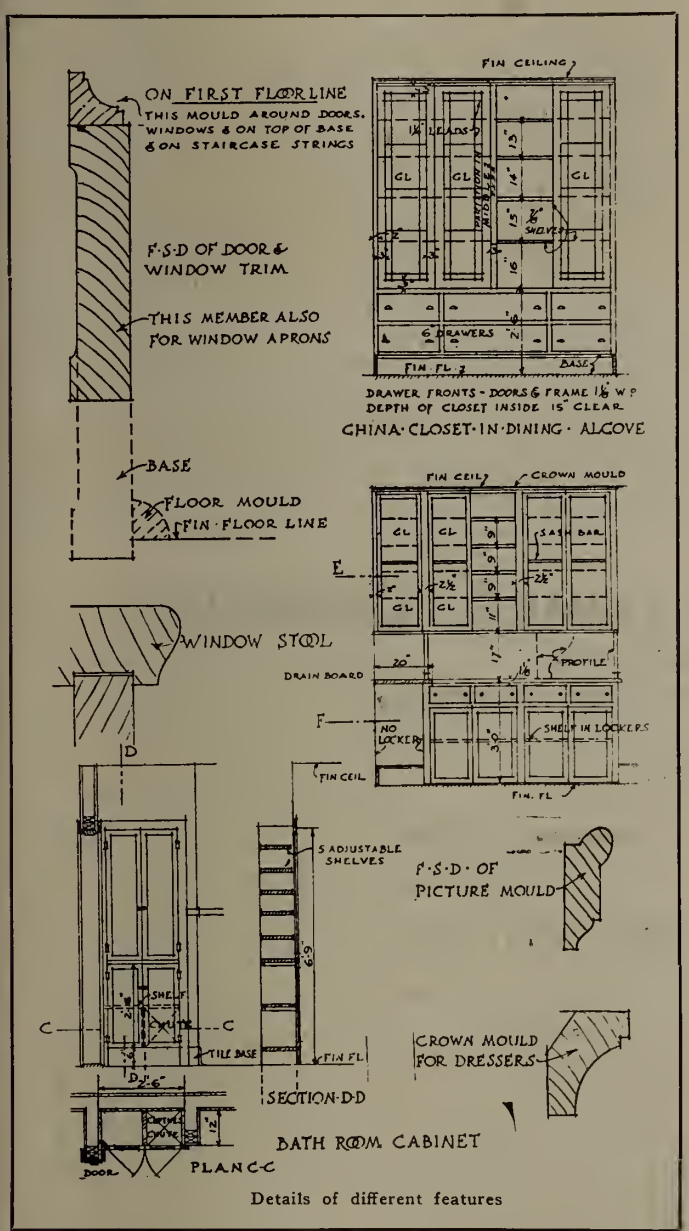
Embodies many good features



Provides large den and bedroom

erator closet with vegetable shelves is conveniently near the range and working table, again eliminating steps. It is always well to make special provision for brooms and cleaning materials. A locker is here provided in a corner of the kitchen where it is about equi-distant from all corners of the house.

Although the bedrooms are on the first floor, the topography of the lot is such that they are well above the ground. The slope of the ground also brings the cellar entrance at grade and makes the adjoining basement laundry a light pleasant room. In it is a closet



Details of different features

for the clothes hamper which is placed open, directly under a clothes chute built into the medicine and towel cabinet in the bathroom above. Both stone and timber are employed in the construction of the walls, stone being used for the basement walls, which at the rear are a full storey above brade.

The stairs to the upper floor run between partitions, with a grill on one side to give light to the first floor hall. This arrangement eliminates considerable expense in building the stairs and makes it possible to hang curtains in winter, to prevent the heat of the first floor from rising to the second. The upper floor has a large open hall, used by the owner as a work room, a large spare room, a second bath, a closet for clothes storage and a storage attic, part of which, if desired, can be finished to afford another bedroom.

In the exterior design an attempt has been made to get away from the "California" type, with its low-pitched roof suggestive of southern climate. Inspiration has been drawn from example of Northern Colonial work.—"Building Age."

Woods Used in Musical Instruments

Resonant woods, like spruce and southern white cedar, are employed widely in the manufacture of pianos and similar musical instruments. For some other instruments, like the violin, wood of unusual strength, as maple and birch, is sought in order to give necessary rigidity, says an article on "Wood for Musical Instruments" in American Forestry for September, 1920.

Spruce takes up and transmits vibrations more perfectly than any other wood that can be had in adequate quantities. The cause of spruce resonance is thought to lie in the wood's long fibres and in their uniform or regular arrangement. The fibres vibrate like so many taut cords.

Of a toal of 43,000,000 feet of softwoods estimated to be used in the manufacture of musical instruments in this country each year, more than 29,000,000 feet is spruce. White pine is second on the list of softwoods with 9,000,000 feet used annually.

The quality of wood in a violin has much to do with the value of the instrument and the old master makers of violins selected their wood and prepared it with as much care as they bestowed on the actual shaping and joining. Maple has always been one of the finest violin woods and it is nearly always combined with some softwood, like pine or spruce.

Hardwoods constitute 80 per cent. of all the material furnished by forests to the manufacturers of musical instrumetns in this country, or about 208,000,000 feet annually. Maple heads the list with 45,500,000 feet; yellow poplar is second with an annual consumption of more than 40,000,0000 feet, and 38,000,000 feet of chestnut is used each year. Oak, elm, birch, basswood, red gum and black walnut follow chestnut on the hardwoods list in the order named. Yellow poplar is an excellent cabinet wood, taking a smooth, fine polish. Highest grade panels may be made of yellow poplar, the casual observer supposing them to be rosewood or ebony. Red gum is also a fine cabinet wood for musical instruments. It closely resembles circassian walnut.

A new material for large musical instruments is California redwood, which is used in a big Detroit pipe organ because of its resistance to shrinkage. In that respect it resembles mahogany.

Matches Not Fit Food for Rats

The theory of the rat and the match as a cause of fire has been presented to Fire Commissioner Latulippe, in a communication from Chicago, where some extraordinary experiments have been made, with the view of deciding whether the origin of fire can truthfully be traced to this cause. The substance of the report on these investigations, which were made by the engineers of the Underwriters' Laboratories, working in conjunction with the match manufacturers, is that the rat and match theory is a myth, and that rats and mice would rather starve to death than eat the modern match heads.

Home Furnishing Campaign in Full Swing

Dealers Enthusiastic About New Movement—Result in Enlarged Market for Furniture--Interest of Artisans to be Aroused—Place Industry on New Level

By R. G. Wells

The Publicity Campaign of the Home Furnishings Bureau is in full swing. The first gun in this important movement was fired on September 21st when a large advertisement carrying the caption, "Let the Homes of Canada Reflect the Nation's Prosperity," appeared in a large number of daily and weekly papers. This has been followed by several other advertisements designed to arouse a greater interest in good furniture and to create a desire for better furnished homes.

In this national campaign, the Bureau hopes to secure the co-operation and active assistance of the retail furniture dealer. It looks as if they will be successful. The work has been under way for only a few weeks, yet the response has been very gratifying Many dealers have written in, expressing thir appreciation of the scheme and offering to co-operate to the fullest extent of their ability. Better than that, many have linked up their individual advertising with this movement, some having caught the very spirit of the campaign itself, and their advertisements will be found side by side with those of the Home Furnishings Bureau.

The slogan, "Better Furnished Homes Mean Greater Happiness," will soon be found in many window displays and in prominent locations in the different furniture stores. In addition, it has been suggested that this caption appear on all the stationery of both the manufacturers and the retailers. There is an old saying that "whatever is worth doing is worth doing well," and it is to be hoped that all concerned will enter enthusiastically into this campaign to increase the interest in attractively furnished homes.

Various American periodicals and associations of furniture manufacturers are evincing considerable interest in the publicity work. Inaugurating this campaign, the furniture industry of Canada has literally put one over on their confreres to the south. The American furniture manufacturers have, on several occasions, discussed a publicity scheme of this kind, but little or no headway seems to have been made. As one well-known publication puts it: "It is, perhaps,

"BETTER FURNISHED HOMES" CAMPAIGN
Conducted by the
Home Furnishings Bureau
IDEAL
The Improvement of Canadian Homes
SLOGAN
"Better Furnished Homes Mean Greater Happiness"
COMMERCIAL OBJECTIVE
Increase in the sale of furniture particularly in small towns and farming districts
PLAN OF PROCEDURE
WITH MANUFACTURERS
1- Talks to manufacturers showing possibilities of the propaganda and what has been accomplished by advertising in other lines
2- Letters to Manufacturers outlining the plans and keeping them informed as to progress of campaign
3- Induce the manufacturers to use in their advertising and on letterheads, etc., the slogan "Better Furnished Homes Mean Greater Happiness" so as to link the campaign together
4- Encourage manufacturers to trade-mark their goods.
5- Encourage manufacturers to get out booklets of their own for circulation among the public
6- Manufacturers should post artisans about the campaign so that they will take more pride in their work
WITH TRAVELLERS
1- Each manufacturer should call his travellers together and carefully explain the objects of the campaign
2- Central committee should issue booklet for travellers explaining how they can help to promote campaign
3 Ask travellers to urge dealers to put in "Better Furnished Homes" window displays.
4- Arrange to have a combined meeting of furniture travellers and have addresses showing how they can help dealers
WITH RETAILERS
1- Use trade papers, letters and folders to explain the campaign
2- Send to Retailers folders containing copies of all advertisements used in magazines, etc
3- Assist dealers through articles in trade papers on improved selling methods and window decoration
4- Educate dealers to improve their local advertising and to use the campaign slogan "Better Furnished Homes Mean Greater Happiness"
5- Supply dealers with cards and other material for window display. Prizes for best window displays
6- Get dealers together at different centres and explain to them the objectives of the campaign
7- Conduct a Home Furnishing Week in the Spring and Fall and have dealers co-operate
8- Establish a reference library of magazines and books on Furniture and Furnishings
WITH CONSUMERS
1- Advertise in newspapers, farm papers and magazines, with slogan, "Better Furnished Homes Mean Greater Happiness"
2- Prepare articles on home improvement that magazines and farm journals would print free of charge
3- Encourage magazines to boost home improvement by furnishing them with cuts of different classes of furniture for free publication
4- A competition might be launched offering prizes for articles or essays on subjects connected with home improvement
5- Encourage speakers at Womens Institutes to give talks on home improvement and furnish them with suitable material
6- Encourage different manufacturers to get out booklets of their own, for circulation among the public, showing lines of better furniture
7- Have general booklet on "Better Furnished Homes" prepared for circulation among public

Chart showing scope and activities of "Home Furnishing" campaign

unfortunate that Canada must take the initiative in this step. Red-blooded Americans don't like to see our northern neighbors beat us in anything, yet they have gone and done it again." The American manufacturers have talked a lot about this thing, but, as Mark Twain has said: "There has been a lot of talk about the weather, but nothing is ever done about it."

To Increase Demand for Furniture

The prime object of this movement is to arouse in the minds of the Canadian public a greater interest in the design, construction and finish of the furniture, whether fine or medium, that enters into their homes, and to assist them in securing an artistic arrangement of furniture and furnishings. As the idea is developed, they will better appreciate what the different periods in furniture are and what they stand for. The increased interest in fine furniture, which will be aroused, cannot help but result in increased purchases of furniture and an enlarged market for the products of all our furniture factories.

It should be absolutey understood that the object of the Bureau is not to push the sale of any particular style or kind of furniture but rather to increase the demand for furniture of all kinds by arousing a greater interest in home furnishings and by instructing the home makers of Canada as to how they can improve their homes. The term, "better furnished homes," is a comparative one and means better than they now enjoy. That being the case each and every furniture manufacturer should benefit by the campaign now in force.

Arousing Interest of Artisan

A certain amount of educational work is to be undertaken among the artisans in the various factories. The different styles of furniture, which have been handed down by the old masters, live because they express the character and spirit of these men. To such well-known furniture designers as Sheraton and Chippendale, the manufacture of furniture was not a hobby or even a calling, but was a part of their very lives. To this, largely, may be attributed the fact that their furniture stands as a monument to their name long after they have passed away. They were proud of the pieces they had created, proud of the fine lines and proud of the careful workmanship that entered into its construction. They knew what pleasure was for they had done good work.

While conditions are somewhat changed, the artisan in a modern factory producing a line of high-class furniture, has just cause to be proud of the product of the organization of which he forms a part. True, he does not produce the finished article and is, therefore, not able to say that the furniture produced is a creation of his hands, but the thoroughness and carefulness with which he does his work is reflected in the appearance and quality of the finished furniture. The design and workmanship of the furniture which is being placed on the market to-day is moulding the tastes of the general public and is having an elevating effect on the standards of living found in the average home. Is this not something to be proud of? The pride of achievement and the pride of workmanship should guide the mechanics in the Canadian furniture factories, for they are producing furniture that bears the stamp of an artist and which will, in all probability, be handed down to succeeding generations as heirlooms.

The Home Furnishings Bureau plans on working in close touch with the retail dealer and will assist and co-operate with them in every way possible. Not only that but educational work is to be done among the representatives of the furniture manufacturers, so that they will be prepared to do their share in spreading the gospel of better furnished homes. In this connection a convention is being planned for the travellers, at which they will be able to get together and formulate plans for furthering the good work. The result of this movement should be to raise the furniture industry to such a high level that instead of being an industry devoted only to the manufacture and selling of furniture, it will be an industry devoted to creating, manufacturing and selling artistically furnished homes. "Better Furnished Homes Mean Greater Happiness."

Furniture Manufacturers Meet

The Furniture Manufacturers' Association held a general meeting in Toronto on September 17th, at which the plans of the Home Furnishings Bureau were outlined and general business conditions discussed.

The furniture industry is experiencing a slack period, which, coupled with the general air of uncertainty that pervades all markets, calls for calm and courageous judgment on the part of the furniture manufacturer. Conditions in the raw material and labor markets do not justify a general reduction in furniture prices, and any attempt, by even one furniture maker, to unload stock at reduced prices, would have a most disastrous effect, as it would tend to demoralize the market and result in an air of uncertainty that would curtail buying for many months to come.

According to the most recent reports shipments for July were 86 and for August 80. It is anticipated that this figure will show an improvement for September. The information presented at this meeting revealed the fact that skilled workmen were still scarce and that costs for the period ending August 31st did not point toward lower factory prices. A considerable reduction had taken place on oak lumber but this was negatived by the fact that the product was not costed on the basis of the high levels reached by oak. Had this been done oak furniture would have been selling for more than walnut. Something that would have been hard to do.

In all probability another meeting will be held in a few weeks when conditions have had a chance to clarify and to a certain extent stabilize. This would enable the furniture men to form a much clearer idea of the outlook.

Maintain Efficient Fire Brigade

The Canada Furniture Manufacturers, Limited, Woodstock, Ont., maintain at their woodstock plant an efficiently equipped firehall, manned by a well-trained fire brigade. This brigade consists of six employees of the company, headed by Chief Berlett. The firehall is located across the street from the plant and caters to the comfort and convenience of the firemen, provision being made for commodious sleeping apartments for the men, a billiard room, club-room with card tables and other similar features, in addition to the usual fire-fighting appliances. The fire pump installed in this building is for emergencies only and is capable of supplying an auxiliary water supply of about 1000 gallons per minute. A 100 h.p. electric motor furnishes power for the pump. The members of the fire brigade are Fire Chief Chas. Berlett, Ronald McInnes, Stanley Morris, Wm. Gray, Arthur Stewart and Wm. Masell.

Day of Opportunity for Furniture Industry

Industry Faced with Strong Potential Demand—Application of Art to Furniture Making—Quantity Production of Attractive Pieces—Good Furniture Defined

By Frank Purdy

That the value of the art element in manufactured products must be very definitely taken into account, is now a conceded fact that is, fortunately, if still slowly, becoming more generally recognized by manufacturers and dealers.

Changed conditions brought about by the war have, however, necessarily altered our opinion about many matters and have made us all think intently about many things which we have heretofore considered of slight importance, or have even been quite insensible to. In connection with our industrial life, for example, we are beginning, at last, to appreciate three important facts:

First: That our great wealth of raw material is not inexhaustible, that it must be conserved, and that

New design shown at Grand Rapids furniture exhibition

it must be increased in value by converting it to a greater extent than formerly into completed manufactured products by our own skill and talent, rather than disposing of it too lavishly in bulk to foreign markets, for others to enhance, if we would retain our economic stability and insure our country's progress along material lines.

Value of Art to Industry

Second: That any manufactured product requires not only the introduction of the art element in some cases in some form in order to complete it, and that approximately half the work in the making of any article requires art training, but that it is this abstract art element that is largely responsible for the ultimate commercial value of an article, and that the character of the art introduced—whether poor, mediocre, fine or superfine—can increase the value of crude material from one to one thousanl per cent. or more. To illustrate, it is art, and art alone, that transforms the $5 gold nugget into the $500 French brooch. In the same way a few feet of raw timber may be worth, perhaps, $10 to $20, yet the exquisitely designed antique reproduction made from these very logs will sell without difficulty for ten or twenty times that amount; art, and art alone, has been added. That is what is meant by the value of the art element in industry..

Third: That we have right here in North America a great wealth of creative talent, most of it as yet unrevealed, but nevertheless waiting to be discovered and put to use, and that if we will recognize this talent, train it and apply it to our industries, in place of the foreign talent now needed at home, but formerly resorted to by our manufacturers, we will at once and at the same time, increase the value of our raw materials, strengthen our whole industrial fabric, and—through the development of our creative force and the commercial use of art—grow in culture and refinement.

If we would express our awakening to these facts, we must do so by action, not by mere thought. While the facts, or principles cited, apply to all our manufacturing interests, they seem to fit just now with striking force to the home furnishing industry. In this industry the present moment is, I believe, particularly opportune and momentous. Together with our ever-present responsibility to the great ideal of better homes and more beautiful living, a responsibility emphasized just now because of many disturbing influences, we are facing three practical conditions which definitely concern the furniture or home furnishing industry. These three conditions are: (1) The unprecedented need and demand for furniture. (2) The equally unprecedented call from foreign countries for ready-made furniture. (3) The coming expanded world-trade for which we must competed with foreign industry on a more equal basis than before. The sum of these three conditions implies greater and better production.

Call for Greater Production

Now, if such is the unparalleled state of affairs insofar as our furniture industry is concerned, what are the radical steps to be? How are our great captains to the furniture industry—manufacturer and dealer, wholesaler and retailer—who so largely, if unconsciously, mould the home, to meet this responsibility, and make the most of the present stimulated trade conditions? Shall the furniture industry go on for better or for worse? Shall our undeveloped possibilities in the field of industrial art, now coupled with lack of artistic aid from Europe, permit us to lose one of the greatest industrial chances of history, or, determined to win, shall we face the music with well-laid plans and decisive action? Surely an opportunity combining so closely patriotic service with individual gain is worth intense and orderly thinking.

Let us analyze the problem further. In spite of a certain big volume of business, and with reassuring exceptions, this continent has failed singularly in the past to make good in the furniture industry, or at least to take full advantage of her possibilities. Excellent high-priced furniture has been turned out by combining foreign talent with our raw materials, and by paying the piper in reduced profits to our country, and in limiting such furniture to the few. Of the strictly low-priced furniture industry, through utter disregard of good art, through the misuse of accepted foreign and historic designs in an unintelligent effort to adapt them to our modern machinery, and in attempting to attract an uncultivated public taste by offering bizarre novelties, we have made an atrocious bungle. Here the nation, as a whole, in a more or less discontented

home life and stagnating creative or art impulse, has also paid dearly.

Let us continue. Of one thing there is absolutely no doubt. The furniture industry is needed to-day as it has never been needed before. Whether for better or for worse, it is bound to grow. With almost the whole civilized world clamoring for homes, production of the wherewithall to make these homes habitable and comfortable must increase. In addition to this very positive fact, it is also true that those who used and are buying furniture to-day are largely those with incomes under five or six thousand dollars. Consequently, the present demand is for comparatively low-priced goods. This is all plain enough. It seems to me, therefore, that the specific question to be squarely faced and fairly answered in this: How is this necessary, low-priced, quantity production to be provided for, if we would foster the ideal of more beautiful homes and observe the trade value of good art in manufactured products ? How, in other words, can we make quality compatible with quantity and low prices ? This may prove a hard nut to crack, possibly, but one worth cracking.

Better furniture on a quantity basis, for to-day and the future—furniture that will elevate and satisfy the home, that we can all afford to buy and pay for, and that will meet the acid test of competition in foreign markets—can only come: (1) Through a broader understanding by the entire home furnishing industry—manufacturer, dealer, salesman—as to just what good art applied to articles of everyday use, such as furniture really means. (2) Through a more common recognition of the full value of art in industry to the nation, to the trade, and to the people. (3) Through the more intelligent application and greater emphasis of the art element in the manufacture of furniture.

To this must be added the encouragement and use of high standard designs created for quantity production, and a more careful selection of the simple historic patterns in relation to faithful reproduction by machinery. The proper wedding of art and machinery, more particularly the hitching up, as it were, of trained creative talent with the productive factory system is, of course, the important point here. While the machine has its limitations, it is, to-day, nevertheless, one of the greatest allies of art. Give the machine good designs to execute, quality designs that will bear rapid, manifold reproduction without loss of line or contour, and, long misused and abused, it may at least be the means of planting art appreciation in every home in this country.

Defining Good Furniture

But what is meant by good, or so-called artistic furniture ? A piece of furniture that is good—artistic, if one will have it so—means simply and solely that it is thoroughly fitted to its purpose, and honest in construction, without sham or pretense in form, finish or decoration. It is beautiful when it expresses — in shape, color, finish—the most effective utility when it is at once "a satisfaction and an inspiration." It obeys no passing fad or fashion. It is not necessarily costly in material, workmanship or ornamentation. Harmony with its surroundings—will it fit the place ?—must always be the guiding thought in its selection.

He who would make good furniture for any purpose must be thoroughly cognizant and always conscious of these facts, and in complete sympathy with them. He would make good furniture, particularly to meet the present need, must have equal faith in this creed, and must, in living up to it in his business, have designs meeting these ideals selected or created for him, and definitely fitted to successful machine production on a large scale and at low cost. If he will do this and if in doing it make use of local talent, properly trained, we will see the day, I am optimistic enough to believe, when a good furniture is common —when only good furniture will be tolerated—in every home.

The use of this talent in place of foreign and the creation of high standard designs specifically suited to machine reproduction, will unquestionably reduce the cost of production to the manufacturer to such an extent that he can offer his goods to the public at prices that will meet the present demand, yet amply support his business. This, I am quite sure, is the crux of the matter in the present furniture problem; quality, quantity and low prices made compatible. Add to this, honest reproduction in the less costly or "meaner"

An attractive china cabinet from Grand Rapids

woods, while execution without waste is considered in every stage of the game, from the first sketch to the finished product, and the low-priced furniture business should stand unrivaled as an enterprise of service and profit.

Co-operation of All Branches.

But while all this concerns the manufacturer specifically, he cannot meet the problem alone with success. To put art and furniture together, on a paying basis, is by no means a one-man game. There are, in turn, the dealer, the salesman and the public still to be reckoned with. Each has his own part to play, and each must co-operate whole-heartedly with the other. The dealer must know good furniture, and sense every phase of its value just as surely and as truly as the manufacturer does, and in demanding for his trade good furniture—true value, not "eye value"—that can be sold at low prices, strengthen the manufacturer's stand accordingly. Further, by coming to the same conclusion that articles of true artistic merit are, after

all, the "best sellers," he will increase and strengthen his own trade as well. A customer will buy more, and pay more, if he is convinced that he is acquiring something of permanent value for his money.

There is much ahead of us, if we are only all big enough to see it, and are willing to pull together—artists, manufacturers, dealers and public. The comfort and beauty of the home is no small matter to work for, particularly if we can build up its necessary furnishings on the results of our own art talent applied to our own raw materials. Any intelligent effort that we can make as a nation in this direction must result in our material welfare and cultural advancement.—"Good Furniture."

The Red Flag of Overhead Costs

Gives Warning of Dangers Ahead—Lowered Production Increases Load Carried—How High Overhead Eliminated Profits

By W. A. Babbitt*

Along the main lines of travel, at the dangerous turns, an enterprising tire company has erected life-like "silent policemen" who stands with red flag in hand, warning all drivers to slow down and prepare to change direction. To drive ahead at the same speed without changing one's direction, or to drive ahead at the same speed and attempt to change one's direction both invite disaster and probable instant death. So life-like are these giant "silent-policemen" that horses usually crowd over to the inside of the curve. But the records of many a famous death curve are ample evidence of superior mentality of horses, to say nothing of mules.

At a recent meeting of folks interested in the Forest Service, a speaker described a pessimist as a man who insists on wearing both a belt and suspenders. To press the figure a little further, it might be said that there are optomists who are so sure of future contingencies that they never wear belt or suspenders.

Of this type of optomists are the fools who attempt to take "death curves" a fifty an hour, and the manufacturers who scorn to know what their overhead is, and drive on unmindful of its warning.

Frankly, we are not making overly rapid progress in getting wood turners, to put their cost accounting on a scientific basis, and to arrange their accounts so that they will have the necessary indexes to show from week to week just where their operations are leading them. We are still having a hard fight to make wood turners believe, with the kind of faith that results in consistent action, that overhead is the friend and protector of sound business. Deep down in their business thinking, they still cling to the old idea that this overhead thing comes straight from the father of lies and bedevils the figures they wish to make in order to get business, that they know they ought not to take. This paragraph evidently has a few mixed figures of speech in it, but the writer hands himself a bouquet of saying that it rather nicely describes the situation.

A Case in Point.

Just recently, a proposition in cost accounting was submitted to the office of the National Association which so completely and strikingly illustrates certain benevolent aspects of this dread bogey of overhead that it might be worth while to go into the matter in detail.

Financial statisticians tell us that any concern that undertakes to manufacture lumber is in the "bloody angle" of industry. These financial statisticians confine their work almost entirely to mortuary records. With solemn glee they tell us that a man who goes into the manufacture of lumber takes ninety-five chances of winning. About the same as an unfavorably located snowball where weather conditions are less favorable. So just to give a new angle of vision, this discussion concerns a sizable lumber operation, which was able to hold its position by a desperate operation, but whose every attempt to go over the top and capture a profit was completely defeated.

Estimates Conservative in Extreme.

It certainly looked good. Their stumpage was near to their mill. The mill was on a great transcontinental railway. Their power plant was practically new. Their machinery first-class. Their organization lined up well both for ability and experience. The rated capacity of their mill was 25,000 ft. per day. But they did not propose to overestimate their ability. So they planned their season's operation on an estimated production of 15,000 ft. per day. The railway assured them that there would always be an ample supply of cars. Their banking situation was all that could be desired. Their market was assured almost from the outset. The labor situation was not what it ought to be, but far better than the average, taking one similar operation with another.

When it came to figuring anticipated profits, again they took such a conservative view as would be expected from such experience and successful business men. They figured to cut a million and a half feet and make $15.00 per thousand. It was hard to see how they could miss it.

How It Worked Out.

They cut a million two hundred thousand. They didn't make a cent. They probably are several thousand "iron men" in the hole. A post mortem is always a grisly job, but the results are often very instructive to the living. The concern in question is a long way from being dead, but its operations for 1919-20 are defunct. The autopsy of this particular "Corpus Delicte," as the lawyers would say, was not difficult because it involved a straight proposition of "single stream" production. By this is meant that the mill had only one job, viz., to saw logs into lumber.

The logs were delivered at the skidways at a fixed price of $30.00 per thousand. The raw material account therefore is determined for us. The cost accounting that remains is simply to separate the direct or productive labor from all other expenses against this operation, including indirect or so-called non-productive labor. Having isolated direct labor; and having assembled all other costs of the operation into one amount, the method of cost accounting required by the U. S. Government for purposes of determining tax liability, (which method has always been the official method of the National Association of Wood Turners) directs that the cost of direct labor shall be divided into the sum of all other costs in order to determine the

*Address before New England Association of Wood Turners.

ratio which overhead bears to direct or productive labor.

Three Main Factors of Cost.

Having determined this ratio, the problem of cost accounting is reduced to three factors: 1. Raw Materials—This includes every item actually entering into and becoming a part of the finished article. It excludes all supplies, such as machine oil, packing. 2. Direct Labor—This excludes every other item of expense and is confined to the wages of the labor which changes the shape or condition of the raw material into some other shape or condition, usually a saleable product. 3. Overhead—This includes every other item of expense not covered by (1) and (2).

The complete cost formula would then be as follows: Assume the raw material to cost $20.00; the direct labor to cost $8.00; and all other expenses to cost $16.00. The sum of these is obviously $44.00, or the entire cost. The overhead ratio is $16 \div 8 = 2$, or in terms of percentage the overhead ratio is 200%. In other words, it costs the shop two dollars in order to keep each dollar's worth of labor at the machine which manufacture the goods to be converted into money, wherewith to meet the payroll, the bills for raw materials, and the myriad of other expenses of operating a plant. Now it is evident that if the labor at the machine is slack or incompetent, it will produce less saleable output than is required to pay expenses and profit. Production may fall to the point that not even expenses can be met. It is not the purpose of this article to discuss cost accounting. It is intended to show how the ratio of overhead to direct labor is really a red flag to warn the operator that danger is ahead.

The Red Flag of Warning.

One thing stands out plainly. If an hour's production is lost, the loss is not only the cost of the direct labor involved, but also the cost of the overhead resting on that labor, and also the profit anticipated, as a reward for undertaking the risks and expenditures involved.

If an operation shows a very high overhead ratio, say 500%, it follows that every hour of lost production carries with it an enormous penalty. In such a plant a two hour lay off due to any cause would cost about as follows: On the basis of 10 hour day, with the direct or productive labor costing $10.00 per hour, using $20.00 worth of material per hour, with a plant overhead of 500%.

2 hrs. at $10.00 per hour (direct labor)	$ 20.00
500% overhead	100.00
20% profit on above	24.00
20% profit on $40 worth of raw material	8.00
Total direct loss	$252.00

There might be some small saving in the way of unused supplies, fuel, etc., but all such savings would be more than wiped out by the cost of restoring production to its normal speed.

Actual Overhead Figures.

With this lengthy but necessary explanation, it will be interesting to examine the operation costs of the saw mill in question. The figures given represent actual costs prevailing in Maine last winter.

Indirect Labor Per Day.

Superintendent	$ 7.25
Millwright	7.25
Filer	8.75
Engineer	5.25
Blacksmith	5.25
Fireman	4.75
Night watch	4.50
Yard boss	6.25
2 jumper loaders	9.00
6 lumber stickers	25.50
5 sawmill helpers	22.00
6 sorters and tiemen	27.50
3 men and single horses, yard	18.00
Total indirect labor	$151.25
All other expenses, salaries, supplies, taxes, depreciation, selling expense, etc.	$140.00
Total daily overhead	$291.25

Direct Labor.

11 sawyers and trimmers averaging $6.25 per day $68.75

Overhead ratio, 424%.

Cost of Two Hours Shutdown.

Two hours' direct labor, $13.75; two hours' indirect labor, $58.25; lost profit on above, 20%, $14.50; lost profit on material, $18.00. Total, $104.50. Or roughly $50 per hour.

The owners of the mill write: "Owing to breakdowns, climatic conditions, and other unforeseen troubles, our production dropped from 15,000 feet per day (estimated) to an actual production of 10,000 ft. per day." To anyone at all familiar with cost accounting, it would have been just as easy to forecast the result as to figure up afterwards. Their lumber cost $70.00 in the yard instead of the estimated $50. Their distributed overhead ate up all their profits and $5.00 per thousand besides, assuming they have no losses on collections.

Many important lessons should be drawn from this true and accurate story of a winter's operation. Here are five:

1. Where the overhead is high, the hazards are great.
2. Lavish investment in extra tools and spare parts is far more economical than shutdowns.
3. Overhead, figured week by week, is the red flag to warn operators of their danger, before they were wrecked.
4. Undistributed overhead due to shutdowns, failure to maintain the production speeds on which the work was estimated, slack and incompetent productive labor, will surely and quickly destroy both profits and capital.
5. The plant that attempts to run without its operative overhead definitely established is criminally reckless as the railroad that attempt to run without safety signals.

Employs None But One-Armed Men

England's greatest employer of one-armed men was a recent visitor to Winnipeg. He is W. H. Dunkley, of London, manufacturer of carriages, and is on a preliminary survey of land and social conditions in Canada, with a view of bringing poor from the slums of London to Canadian farms.

Since the armistice Mr. Dunkley has employed none but one-armed men. He has now three hundred of them in his factory and has found that these crippled soldiers properly trained, not only can do almost the work of a man with two hands, but are given a new interest in life working entirely with men of their own kind.

Value and Application of Standards

Calculating Efficiency of Workmen—How Friendly Rivalry Stimulated Production—Exact Basis for Fixing Piece Rate—Valuable Data for Preparing Estimates

By James J. Martindale*

(Third of series)

Referring to the article in the September "Canadian Woodworker," in which it was explained how a standard time of 10.4 hours per 100 had been built up for a certain job—it can be assumed that all jobs in a department would be studied and analyzed in the same thorough manner with a corresponding result.

This work takes time, as it must be done in a careful painstaking way. It is vitally important that all facts bearing upon the particular job studied be recorded on the time study blank. It is also most necessary that each time study be "worked up" at once,—that is, develop the standard time soon after taking the observations. In no case allow the figures to get "colder" than 24 hours.

How Efficiency is Calculated.

If a man worked 8 hours on four different jobs—the output of each job multiplied by the standard time applying to each job would furnish in each case standard hours. The summation of the four "standard hour figures" for the four jobs, divided by the actual hours (8) gives an efficiency result for the operation of that day. This result can be shown in a daily report similar to form shown in the accompanying illustration. This report will give the efficiency of each man as compared to every other man and will also give the standard hours, actual hours and efficiency figure of the department as a whole.

It is quite possible to increase production by the use of this report and still not change one piece-rate in the department as evidenced by the following "story" : "What do you think about that paper they stick up every noon, Andy?" "I don't know, but I'll tell you something, Bill; I'm just as good a carcass builder as Peterson and I'm tired of seeing my name under his in that there list. I'm going to show him up tomorrow." Thus spoke two men in a rubber tire carcass building department. Andy "went out" and easily made one more carcass than Pete and the race was on.

Result of Friendly Competition.

Both Pete and Andy as well as all other builders felt their daily earnings were limited to $4.50. The general opinion that rates would be cut if the pay exceeded this amount prevented the older men from turning out more tires. Accordingly, stalling was most apparent, particularly in the afternoon. The management had not been able to instill faith in the men as to the stability of piece-rates when once set. Andy's decision to beat Pete had not been reached on the spur of the moment. The paper (efficiency report), showing relative standing of men had been "put up" every day for three weeks. Both Andy and Pete had been jokingly chided as to their standing a number of times and the seed sown for a friendly race. Moreover assurances had been frequently and positively given that rates would not be cut.

Pete and Andy slowly jockeyed around. Their pay jumped to $5.00, then to $6.00, and still there was no cut. Other builders "took the chance"—turned in more tires and the race was on in earnest. The men gained faith in the company—their work was made easier for them—the petty and vexatious delays that held them up were reduced—life in the plant became more attractive. They relished the fact they were showing their true abilities and not hiding them.

Pride of Workmanship Developed.

All of us like to be experts in our line. The trick bicyclist and the crack swimmer like to perform. Rubber tire carcass builders are no exception. Pete and Andy developed a very poetry of motion. Their hands, body, feet and head were beautifully synchronized as to movement and how they enjoyed being watched. Production went up 22%. Piece-rates were not changed. Best of all, the plant atmosphere was made over. The men were proud of their working place—they felt Responsibility and could look their superiors confidently in the face.

In the case mentioned, where a standard time of 10.4 was obtained, if it was desired that an operator earn 70c per hour—the multiplication of 70 and 10.4 gives a piece-rate of $7.28 per 100 pieces. This piece-rate is set upon facts—it is not based upon what the foreman "thinks" or what past records show up. Past records if referred to at all are used only as a check. Therefore the rate is just to the operator and the company—does not allow of favoritism to any man. Sometimes errors will creep in. When this occurs the mistake must be corrected at once.

Take Employees Into Confidence.

It has been found in work of this nature that it is wise to be absolutely open with the men. Secrecy in

*James E. Morrison Co., Industrial Engineers, Detroit, Mich.

EFFICIENCY REPORT

Department Date 191

									Mat.	Work				

Form for daily efficiency report

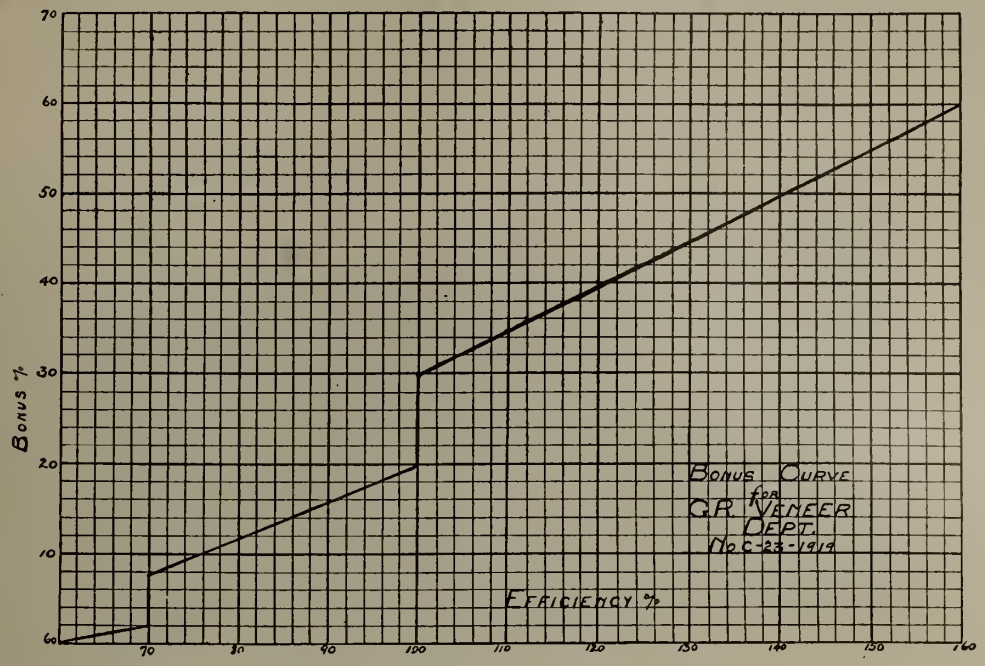

Chart showing how bonus was figured

making time studies does not pay. One should inform the worker about the study and get his co-operation. A good time study man must be of an observant type, analytical in nature and continuously imbued with a spirit of kindness and helpfulness towards the workers.

Two years ago standards were set in a certain plant in New York State on a small percentage of the total establishment. Last winter the employees of this particular shop formed a Works Council and among their first communication to the management was a request that standard times be set on all the remaining plant activities. In view of the present great labor unrest, dissatisfaction, etc., this action on the part of labor is most interesting. It is like a ray of sunshine on a cloudy day.

Bonus as Aid to Production

A bonus form of pay is sometimes set up, based upon the showing of the efficiency report. A bonus curve is shown on the accompanying chart which was used in a woodworking shop to take care of a particular condition. A gang of ten men were employed in the department—their work all dependent upon the operation of one machine. These men were, however, indifferent to any efforts to help them and their customary efficiency was lower than ordinarily met with when inaugurating industrial betterments.

It was felt that the curve should start at a figure lower than the average, namely 60%, in order to get the men earning bonus as soon as possible. Further, when the gang reached 70% efficiency an increment of 5% was added to furnish an additional spur in money for further effort. At 100% a 10% increment was added, giving a total of 30% bonus for 100% efficiency. The increment at 100% performed the function of getting the gang out of the 90% class over 100% and kept them there. A 10% raise in pay for slightly extra effort was not to be ignored. In this case the gang efficiency report was posted in a prominent place every day. Production in this particular department due to this work increased over 100%.

Checking Non-productive Labor.

On the right hand side of the efficiency report under "Non-Prod. Hours" are shown the hours of delay over which the worker has no control—such as "wait for material," "wait for work," etc. When a superintendent or general manager daily receives such a report as this on a department he has absolute control over that department. He can, with reasons based on facts, ask the foreman and the production department to reduce the delay hours.

Every delay hour (Non-Prod. Hour) changed over to a productive hour means increased standard hours and therefore increased output. Every hour thus swung over makes the department more efficient as it has a beneficial effect on the minds of the operators—they do not have to contend with so many troubles and waits—their stride is less interrupted. The foreman can take care of those hours over which he has control, but if he is held up for material due to a fall down in the production department or a primary department, he will of course quickly show up the location of the trouble and then it is the manager's duty to iron out the cause for "wait."

Enables Manager to Keep in Touch.

The general manager, and his request cannot be construed as unreasonable, can ask the industrial engineer or time study man to bring up the efficiency of the low operators shown on the report and call for an increase in total standard hours of the department. This report will prove up a good or weak foreman—will show his progress or retrogression.

A series of standard times once obtained can frequently be compiled in various charts. When a new job is to be estimated upon, it can be divided into its elemental operations and by referring to the proper charts, the standard times for these operations can be quickly obtained and added together to obtain a total standard time and consequent labor cost for the job as a whole. Thus the standard time will form the basis for the labor estimate which added to material, overhead and profit will form the quotation.

St. Thomas, as Handle Manufacturing Centre

Oldest and Largest Handle Factory in Canada—Local and Overseas Markets Reached—Northern Woods Make Best Handles

By W. E. Clarke

Handle manufacturing is an industry that is growing and expanding in Canada in a very quiet, but none the less effective manner. Of recent years many new handle plants have been started, in different parts of the country, and the manufacture of this line gives every indication of assuming large proportions.

There are several reasons for this active development, among which the following might be mentioned: Formerly a large proportion of the handles used in Canada were of American origin. When the United States entered the war, this source of supply was practically cut off, owing, largely, to the Government requisition of lumber and manufactured wood products. An opportunity was thus created that was taken advantage of by numerous Canadian woodworkers. Another reason is that the Canadian handle men find that they can compete with the American manufacturers, with the result that, at present, fewer handles are being imported from the States than in pre-war days. Again, the strong demand which exists, both domestic and foreign, has had a certain bearing on the growth of this business.

Woods Commonly Employed.

The woods used are principally hickory, white ash, maple and a certain amount of rock elm. For broom handles, beech, birch, maple and other hardwoods answer admirably. Hickory and ash are imported from the different American producing centres, the Canadian supply of these woods being totally inadequate to satisfy the requirements of the industry. Where local woods are procurable they are preferred, for northern-grown timber is stronger, tougher and heavier than that grown in warmer and less rigorous climates. These are very desirable qualities in wood for the manufacture of handles. When imported, the handle material is brought in, in the shape of billets or what is known to the trade as dimension stock. These are all sized and graded ready for turning. Purchasing material in this shape practically eliminates all waste as well as effecting a saving in freights. In addition, being rough sawn, it enters Canada free of duty.

During a recent visit to St. Thomas, Ont., the writer had the pleasure of visiting the three handle factories which are located in that city. St. Thomas may not be very large or known as a woodworking centre, yet it boasts what is claimed to be the oldest and largest handle factory in Canada, the J. H. Still Mfg. Co.

This progressive concern was first located in Tilbury, Ont., where it was founded by the late J. H. Still in 1885. Three years later, 1888, the plant was moved to St. Thomas. Here the business has grown and expanded, until at the present time employment is given to about fifty hands and the output of the plant averages about 300 dozen handles per day. It is just possible that this output will be doubled in the near future. The handles manufactured include axe, sledge, pevey, fork and shovel handles. In addition such articles as whiffle-trees, double-trees, neck yokes, etc., go to make up complete line.

When the local woods are used, they are worked right from the stump to the finished product. Such timber is purchased standing and is felled, cut into cants, then ripped into billets and finally made into the finished product. Numerous automatic gauge and copying lathes are operated. This firm caters largely to the domestic trade and do not experience any difficulty in placing their entire output. While there undoubtedly exists a strong demand for handles for overseas shipment, yet they feel that the domestic market has the first claim on their product.

Newer Concern Has Fine Plant.

The Elgin Handle Co. of St. Thomas, is practically a newcomer in the handle field, having been organized in 1915. The original partners were experienced handle men and the business has grown and expanded under their skilful guidance. This steadily increasing volume of business necessitated larger quarters where greater production could be secured. About a year ago the plant of John Heard & Co., manufacturers of carriage stock, was taken over and fitted up as a handle factory. It requires considerable drying space to operate this business as the billets or planks are usually stacked in drying sheds for seasoning. This requires from 2 months in summer weather to 6 or 8 months when drying conditions are not so favorable. Another factor is that where hickory is imported it must be brought in during August, September and October, and a sufficient supply stocked for the total requirements of the following nine months. The hickory manufacturers can cut only about three months in the year, and all business should be transacted in that period.

The Elgin Handle Co. produce about the same line as the J. H. Still Mfg. Co. They are, however, making a stronger effort to secure some permanent export connections. At the present time a few shipments are being made to Europe and practically regular shipments to South Africa, that is, nearly every boat sailing for South Africa, carries a consignment of Elgin handles. Owing to the difficulty experienced in securing skilled mechanics, production in this plant is slightly below normal. At the present time about twenty men are employed, and the output totals in the neighborhood of 125 dozen per day.

Output Confined to Broom Handles.

The Peerless Handle & Broom Supply Co. operate a small plant on broom handles and similar lines, such as mop and straight handles for snow shovels. One Ober handle lathe, together with auotmatic trimming and chucking machine and a belt sander, go to make up the installation. About six men are employed and about fifteen cars of finished handles are produced each year.

An effort, which it is hoped will be successful, is being made to organize a Canadian Wood Turners' Association, which is to be either affiliated with the National Association of Wood Turners, an American organization, or conducted as a separate association. Every wood turner should take an active interest and help in the formation of this much-needed association.

Lumber unloaded from cars direct to kiln trucks

How Others Have Lowered Handling Costs

Costly Methods Being Replaced by Labor-Saving Devices—Saving of $3 Per Thousand Not Uncommon—Work Conducted With Fewer Hands and Lower Overhead

By J. C. Heath

The labor required for handling lumber in the yard and around the plant is a big factor in the cost of all articles made of wood. Of late years this subject has received considerable attention and many manufacturers have made an effort to put the handling of lumber on an efficient basis and thus reduce this item. There are two costs involved,—one, the direct cost, which consists of the expense of handling, trucking, piling, etc., while the other, which may be termed an "indirect cost or loss," consists of the depreciation of the lumber due to seasoning, warping and checking. This latter loss may be controlled and to a certain extent eliminated by careful handling and piling and through the expenditure of a little thought and effort.

In this article it is proposed to deal with the labor costs involved in handling the lumber and suggest how the work may be done to better advantage. No effort should be spared to cut down the unproductive labor employed around any plant. The more successful a factory manager is in this respect, the less he need fear the competition of other organizations. Instances can be cited where woodworkers have succeeded in reducing the cost of handling and piling lumber $3.00 and $4.00 per M.,—no small item when hundreds of thousands of feet are handled. Another feature is that the unproductive labor, which was practically going to waste in the lumber yard, may be taken into the plant and put at productive work.

Slow, Laborious Method.

Under the old system, which is followed in so many plants, the lumber is unloaded from the railway cars and piled on waggons, hauled to the site on which it is to be piled, and there unloaded and piled in stacks. When this stock is needed, the pile must be torn down, the lumber loaded on trucks or wagons, taken to the kiln, loaded on kiln trucks, dried, run into dry storage and in some cases unloaded again on to wagons and hauled into the plant. This can hardly be classed as a very efficient method of handling stock, as each board is picked up five or six times, each time involving an outlay of labor and money and also resulting in a certain loss due to breakage and other damage.

The logical solution is quite apparent. Instal a series of tracks in the yard and unload the lumber direct from the car to the dry kiln truck. The accompanying illustration shows the yard of an up-to-date woodworker who has adopted this system. By having the kiln and factory connected by a series of rails, as most up-to-date plants have, the material is moved right into the plant with only one handling. In the modern factory these kiln trucks loaded with lumber are spotted on a lumber elevator, located convenient to the operator of the swing saw, sticker or planer as the case may be, and lowered so that the top of the load would be at a convenient height for the man to work from. As the pile is reduced the elevator is raised so that the top of the pile is kept at a heighth which enables the operator to do more work with less effort.

Gravity System Economical.

Sometimes owing to the large amount of stock carried, the length of time it is kept in the yard and the limited amount of storage room available, the storing of lumber on kiln trucks is not altogether practicable. This would seem to bring us back to the first

consideration of excessive handling. The gravity conveyor system can be employed to advantage in a case of this kind. By rigging up a line of conveyors, the lumber may be, in many instances, moved from the

Mechanical stacker for high piling

cars to the pile or from the pile to the kiln or plant by gravity. Where this form of equipment can be utilized, it will be found to be both convenient and economical.

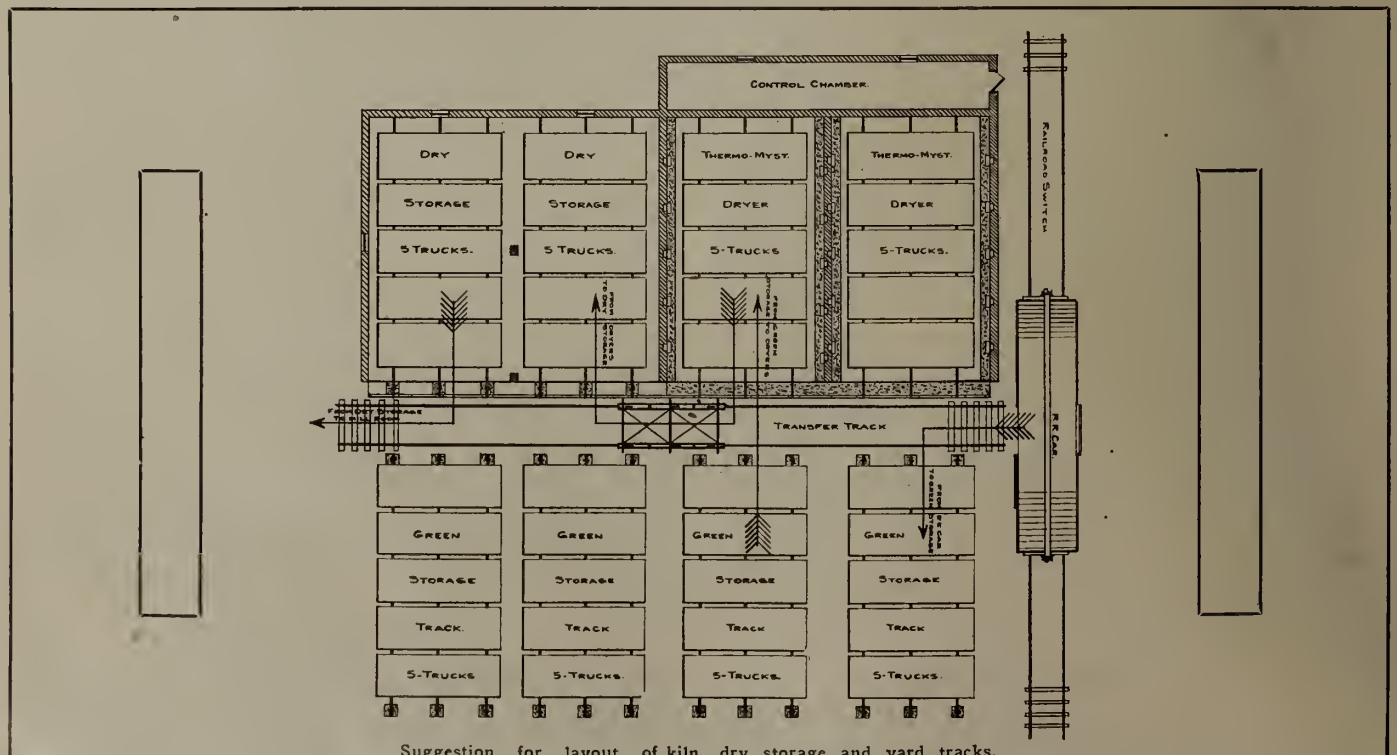
Engineers have come to the rescue of those who, owing to restricted piling areas are forced to build high piles. When lumber is raised 20 or 30 feet by hand, it is a slow, back-breaking costly method. With the aid of some of the newly-devised lumber pilers or stackers, the piles may be made as high as 40 or 50 feet and as cheaply as if it were only a few feet high. The capacity of some of these mechanical stackers is stock from 6 feet to 20 feet long, 4 inches to 18 inches wide and 1 inch to 4 inches thick. From 7,000 feet to 18,000 feet, depending entirely on the lumber being handled, may be lifted on one of these in an hour. The same machine is just as handy for unloading or taking down the piles, and in addition to the reduced labor, will actually save a certain amount of money due to a smaller percentage of loss from split and broken pieces.

Has Many Advantages.

The manufacturer, who uses only a small amount of lumber, can adopt some of the above suggestions to advantage. The saving that may be effected and the labor that will be released for other and more productive work, will go toward reducing costs and increasing profits. The first cost of installing same system in the lumber yard may seem high, but the fact that manufacturing operations may be carried on with fewer hands, a smaller ratio of overhead and with the decreased manufacturing costs, should more than compensate for the outlay involved.

Doors Wanted For Export

A large importing house in Belfast is desirous of getting in touch with a number of Canadian door manufacturers who are in a position to make early deliveries. Doors from Canada have been reaching this market, and selling lower than the local product. It is believed that this business may be extended to considerable proportions. The name of this firm may be secured by writing the publishers of this paper. Refer to inquiry No. 2002.



Suggestion for layout of kiln, dry storage and yard tracks.

Kiln Drying Most Important Operation

Can be Made Pay Big Dividends—How Lumber Dries—Steaming to Relieve Strains—Should be Given Greater Consideration

By H. L. Henderson

The demand for better kiln drying of lumber is due to several economic factors which were not present just a few years ago. The cost of lumber has increased greatly in the last three years until it behooves the manufacturer to take more interest in the care of his raw product, the price of which has bounded upward. Just to cite an instance or two we might consider white ash of good grade which sold for around $85 in 1917 and is now bringing upward of $300 per thousand feet, an increase of 250% in three years. White oak and yellow birch have jumped 280% in the last three years and practically every other species of wood has soared in price.

It does not take a great deal of figuring then to show that a kiln load of lumber worth from $5,000 to $6,000 with a loss due to improper drying as high as 10% would make lumber decrease in value from $500 to $600 by just running it through the kiln. If only 1% or 2% of this loss could be saved in the drying it would more than pay for a good kiln operator and would soon pay the cost of a good kiln.

Kiln Drying vs. Air Drying.

Another reason why the spotlight is being turned upon the dry kiln situation is the scarcity of air dried lumber. This means that greener lumber must be dried with the consequent extension of time required to evaporate the greater amount of water from the wood. In other words, kilns that were serving an industry and giving excellent results while using air dried lumber were found to have only half the capacity or in some cases less when green or partially air seasoned lumber had to be dried. This necessitated not only the addition of more kilns but required that a better kiln be used for drying green lumber.

As the price of lumber jumps upward, we find it more profitable to kiln dry lumber directly from the sawmill. Again considering a good grade of lumber worth in the neighborhood of $200 per thousand, that has been on the sticks for a period of two years in order to dry it down to 12% moisture content, the interest on the money tied up would be close to $25. On the other hand, if this same material were put directly in a dry kiln, (assuming that it was a well constructed kiln and operated properly) in four to six weeks' time it would be dried down to 5% or 6% moisture content at a cost of not over $20 per thousand. It is very likely that if this lumber were properly handled in the dry kiln there would be very much less loss due to warping or surface checking than would be acquired by the air seasoning method.

Types of Kilns.

There are various types of dry kilns in service and it might be well to enumerate them. The first type of kiln might be called the tight heated box in which the lumber is placed and practically baked dry. In the blower type of dry kiln, heated air is forced through the piles of lumber by means of fans or blowers. In the ventilated type of kiln the circulation of air through the kiln is induced by heating coils placed underneath the lumber causing the air to rise and pass through it and then out through properly constructed and spaced ventilation. In the condensing type kiln the moisture from the stock is taken up by the hot air from the strain coils, while the condensing coils placed along the walls cool and condense the moisture contained in the air, causing it to settle along the walls or drop in special troughs. This air is again heated and circulates through the lumber, removing some more moisture. I have not time to go into the methods of maintaining humidities within these various types of kilns but in passing would say that in many cases no attempt is made to regulate either the humidity or circulation, depending largely on the amount of heat that can be applied to the lumber.

Many kinds of all these various types are now in service and many of them are giving excellent satisfaction. There are also many others that are not giving good service. Some were installed for redrying lumber of a low moisture content and when attempts were made to dry green or partially air dried stock the lumber was very seriously injured. Some of the kilns seem to be drying lumber successfully but the time required is from three to five times the necessary period that it would take to dry the same amount of lumber in a properly constructed kiln.

How Lumber Dries.

In order to dry lumber properly basic principles of drying should be understood. When lumber comes from the log it may contain anywhere from 35% to 100% and in some cases more of water, depending on the species, etc. This is made up of two kinds, namely, the water which saturates the cell walls of the wood and is called Hydroscopic water. This makes up about 25% of the dry weight of the wood. The free water is the water which fills the cell cavities and makes up the remainder. This moisture must be driven off before the lumber can be used. There are many reasons why this lumber should be dried before using and among them are: reduction of its weight, preventing decay, increasing its strength, and giving it a fixed dimension. Generally speaking, when lumber dries there is very little shrinkage until after all the free water is evaporated. From the 25% moisture content downward, the greatest amount of shrinkage takes place and continues right down to a very low moisture content. This factor of shrinkage then is the one that does the greatest amount of damage to lumber during the drying process.

In the process of kiln drying, the lumber is heated artificially and the moisture is evaporated at the surface of the boards. The air surrounding the lumber absorbs this moisture until it becomes saturated, after which it must be displaced by drier air in order to keep up the process. In other words, temperature and circulation are very important factors in the drying of lumber. The rate of evaporation of the moisture from the surface of the boards, however, must not be faster than the rate at which the water comes from the centre of the board to the surface. Should this be the case, the surface will dry off quickly and the outer cell of the board will become drier than the centre. Accompanying this rapid drying of the surface we get shrinkage and when the shrinkage power becomes greater than the strength of the wood, checks appear. If this pro-

cess is continued the outer shell of the lumber becomes dried and sets in an expended condition which we term case hardened. As the centre dries down to a low moisture content, these surface checks which were started in the early part of the kiln run, extend on to the centre of the board and result finally in honeycombing of the centre. To prevent the too rapid drying of the surface, the air surrounding the lumber is kept at such a state of relative humidity that it absorbs moisture from the surface of the lumber only as fast as it can come to the surface from the centre.

Circulation, Humidity, Temperature.

From the foregoing discussion it is evident that conditions of temperature humidity and circulation of the air passing through the pile must be maintained at the proper points in order to properly dry the lumber. After the moisture content of the lumber has dropped below the fibre saturation point then it is safe to gradually raise the temperature of the air and lower the relative humidities until the lumber is dried down to 5% or 8% moisture content as the case might be.

Steam is used almost entirely for obtaining the necessary temperature in the kiln but it also plays another very important part in drying lumber. Either live or exhaust steam is mixed with the air of the kiln to maintain humidity. At the beginning of the kiln run, lumber should be thoroughly steamed. This preliminary steaming heats up the lumber to the temperature at which the drying is to start, without any evaporation taking place and furthermore tends to neutralize the stresses that were set up during the air seasoning. It does not open the pores or dissolve the saps, sugars and tannins as is commonly supposed. During the drying process it is quite often found that the lumber has become case hardened or the surface has become over dry and by steaming for about an hour at a temperature of from 10 degrees to 20 degrees higher than the drying temperature these stresses are relieved. At the end of the run should the lumber be found to be case hardened it is possible to again steam it and relieve the case hardening. The length of the steaming period and the temperatures at which it is steamed, depends largely on the thickness and the species of the lumber. If the lumber is steamed too often or too long, however, during the run or at the end, the stresses are very likely to be reversed. Quite often we get discoloration of the lumber and in some cases brashy or weak lumber results.

Essentials to Good Drying.

How is it possible, now, to obtain good drying? The first essential is a well constructed and properly operated dry kiln. By this is meant a kiln in which the temperature can be regulated, and the humidity controlled, and where the circulation can be maintained at the proper rate. The kiln building should be well constructed so that there will not be leakage of heat around the doors or through the walls and should be well insulated so as to be as little disturbed by outside temperature as possible. A good workman cannot work without good tools to work with and the same is true of a dry kiln operator. He should have good instruments which will show him what conditions of temperature and humidity he is obtaining in the kiln at any particular time and he should have a complete record of the temperatures and humidities that the lumber was subjected to during the run. Another point in the proper drying of lumber is to see that the lumber is piled properly on the kiln trucks. Properly piled lumber will come out with a minimum of end checks and warping while improperly piled lumber will cause a great deal of loss in the best kiln made. It is very essential also that the operator, who is called upon to run the kiln understands the fundamental principles of drying. He should know something about the structure of the different kinds of wood. He should be able to test the lumber for case hardening, moisture content, etc., and should know how to handle his kiln in order to get the best results. He should keep records of the temperatures and humidities in each kiln and know how fast the lumber is drying under these conditions. These records should be filed for future reference. If anything goes wrong in the drying of the lumber and no records are kept it is impossible to locate the cause. If, on the other hand, the record of the drying was plotted in graphic form it would be very easy for him to glance over the curves and note the cause of the poor or slow drying.

Not Given Sufficient Attention.

The drying end of the lumber industry has not received the attention it deserves. If the metal working industries paid as little attention to their heat treating furnaces as the lumber industries do to their lumber treating kilns, it is safe to say that they would be many years behind the times. Better kilns handled more efficiently will help to solve many of the production problems. A good dry kiln is just as necessary in the preparation of lumber for manufacture as the heat treating furnaces are to the metal industries and should receive the same consideration from the management. Upon its proper functioning depends not only the quantity produced but also the quality. Just like a high grade costly machine in a factory, it requires continued attention by a skilled operator. It is also safe to say that if more brain work were used in an operation in which many thousands of dollars are involved, the loss commonly resulting in the artificial seasoning process would be many times reduced and the saving would greatly exceed the cost of this service and in addition would help to conserve our fast disappearing supply of lumber.

Tackle It!

By C. P. McDonald

Tackle it!—don't give the world the idea you're a quitter; don't lay down just because you think the goal is out of reach, but tug for it and plug for it and play the role of "gitter"—the higher you may have to climb the sweeter grows the peach.

Take the bit between your teeth and set your muscles to it, although to goad and hump yourself may go against the grain; just chuckle as you hit the pike and tell yourself you'll do it, a lot of labor is the price of every little gain.

Tackle it. Go to it like a thoroughbred in harness; forget the sluggards who gave up before they got a start; forget the distance to the prize—its nearness or its farness—and face the grind ahead of you with laughter in your heart. Hopeless though it seems to be, keep digging like the devil; things are bound to come your way if you but stick it out. Play the game of winning on the square and on the level—purge your soul of discontent and visionary doubt.

Hit it up for all you're worth—don't mind the bumps and bruises—the climb is stiff, but what's the odds if finally you win? The fool who always goes down grade instead of uphill, loses—he cannot finish something if he never will begin.

How Barrel Staves are Manufactured

Description of Two Methods Commonly Employed—Staves Cut to Conform to Curve of Barrel—Many Different Woods May be Used—Comparative Figures on Sawn and Sliced Stave

By H. A. Ralphe

Timber to the extent of millions of feet is worked up annually into staves for barrels and kegs. The woods used are chiefly elm, B. C. fir, pine, basswood, poplar and, in the United States, red gum. Elm makes a very fine barrel and is usually given first choice, but it is a species that is not available in every locality, so that recourse has been made to the other and more common woods. Sawn staves in fir, pine, basswood or poplar make a good, general-purpose commodity barrel, but for shipping such materials as flour, sugar and similar products, a cut or planed stave is customary.

The methods employed in producing staves may be divided into two divisions—sawing and cutting or slicing. The sawn stave may be further classed as flat, curve and bilge sawn. The cut stave is cut, or sliced, on a knife, to conform to the circumference of the barrel.

Flat staves are often sawn on the ordinary circular saw. Owing to the amount of material wasted in hollowing and hacking these pieces, this method is not followed to any great extent. The ordinary procedure is to saw the material on a drum saw, which gives a curve, conforming to the size of the barrel. This method eliminates a certain amount of waste and makes a satisfactory stave for ordinary barrels, though the sawdust made represents so much waste material. If a bilge drum saw is used the product conforms both to the circumference and bilge or bulge of the barrel.

Owing to the fact that the saw leaves a comparatively rough face and that a certain amount of sawdust clings to the surface, the sawn stave is not generally employed for sugar or flour barrels. The objection is that the sawdust gradually works loose and mixes with the contents of the barrel. Special machines are on the market, in the form of single or double surfacers, that will plane one or both sides of the stave. With the sawn stave surfaced in this manner it could be used for practically any material. One advantage of the sawing method is that smaller material can be worked up than when the slicing process is followed.

Slicing Process Economical

The sliced or cut stave is made from steamed stock and, as mentioned, is cut to conform to the curve of the barrel. The sharp knife used leaves a smooth surface free from sawdust or chips of any kind. Thus the stave may be used for any purpose, just as it leaves the knife. The waste due to the saw is eliminated, thus effecting a saving in material. As a rule the slicing process will producec about 15 per cent. more staves than the sawing method, from average timber. Special equipment in the shape of steaming retorts, is necessary.

Which ever way the staves are cut they are usually made from logs or bolts. If logs are used, they are cut into bolts in a saw mill. The material is usually cut to rough stave lengths on a drag or swing cut-off saw. Sometimes a bolter or splitter is employed instead of a saw to split the logs into pieces, preferably quartering them. The men required in the saw mill and power department would be the same whether sawing or slicing were resorted to; in fact two drum saws could be supplied with material by the same staff.

Description of Equipment

The equipment needed for manufacturing sawn staves, after the bolts are roughed out, would include one set of equalizing saws, to cut the bolts to the exact stave length, one drum saw, one planer to surface one side of stave, or double surfacer if two sides are to be dressed, two foot bilge jointing machines, two packers, two tables, together with the necessary wheel barrels and stave waggons. The capacity of this outfit would run from 10,000 to 12,000 sawn staves a day, depending largely upon the skill of the operators and the quality of the timber worked up. Ten men and four boys would be needed to operate this equipment and handle the product as follows: A man to wheel bolts to saw, operator for equalizing, operator for drum saw, culler, man to carry culls, a man and horse to haul staves to drying sheds, two pilers, two jointers, two packers (boys) and two tadders (boys).

For manufacturing sliced staves from the bolts, the equipment differs slightly and would consist of one set of steam boxes, say, twelve compartments, equalizing saws, stave cutter or slicer, four, foot bilge jointers, four packers, four tables, four stave waggons and a number of trucks for wheeling the bolts to and from the steaming chambers. An endless chain is sometimes installed to carry the stock to and from these boxes. This installation tends to reduce the labor costs. The output would vary from 40,000 to 50,000 staves per day.

As the slicing machine has a greater daily output than a drum saw, more men are required to operate this outfit. About eighteen men and eight boys are needed. These would be distributed as follows: Two filling the steam boxes, two pulling steam boxes, bolt wheeler, man to operate equalizer, man to operate slicer, culler, cull carrier, man and horse for drawing staves, two pilers, four men to operate stave jointers, four packers (boys) and four tadders (boys).

Comparison of Two Methods

It is difficult to compare the two methods as each is best under certain conditions. Where the timber is hardwood, such as elm or gum, and of good size and quality, the slicing process is considered to be the best. For small timber, under 8 inches in diameter, and especially for softwoods, such as pine, basswood, poplar, B. C. fir and other similar woods, the saw works to better advantage. The drum saw is usually installed where long staves are to be manufactured and the bilge saw for keg staves. Timbers as small as 4 inches in diameter can be worked to advantage on the saws.

A man or company with a limited capital and a small amount of timber should find the equipment for making sawn staves very economical and satisfactory.

Hardwood Products from Nova Scotia

Output of Lake Jolly Plant Confined to Dowels and Clothes-pins—Modern Production Equipment Installed—Wood Refuse, Mechanically Stoked, Provides Power—Welfare of Employees Considered

In addition to large pulp and sawmill interests, the firm of Clark Bros., Limited, Bear River, N.S., operate a large woodworking plant at Lake Jolly, N.S. This firm was incorporated in 1919 under a Dominion charter to take over the business and assets of Clarke Bros., Limited, operating under a provincial charter, granted in 1911. Previous to that time the business was conducted as a partnership by W. G. and W. W. Clarke. These two gentlemen are well known in Nova Scotia business circles, having been in business there for over thirty-five years.

W. W. Clarke, of Clarke Bros., Bear River, N. S.

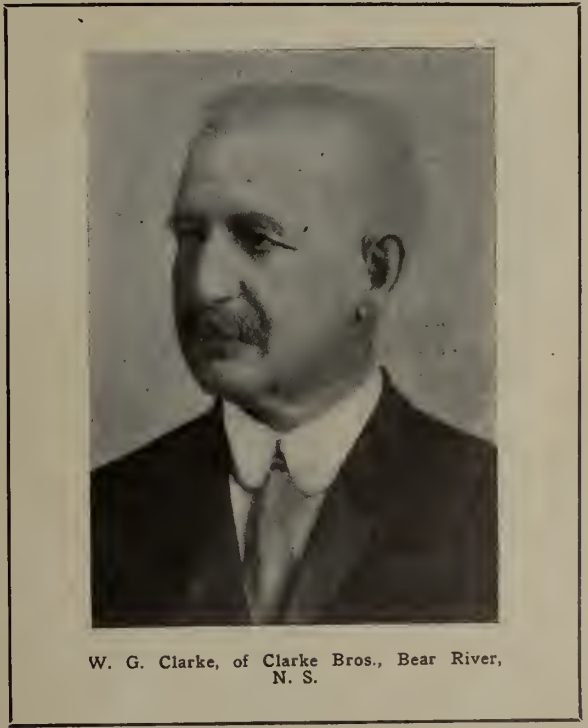
The reorganization as outlined above, was made principally with a view to developing a large pulp enterprise at the mouth of the Bear River, but at the same time the existing operations of the company were reorganized and extended. During the spring of 1919 the woodworking plant at Lake Jolly, which had been engaged in manufacturing both hard and softwood products, such as lumber, sash, doors, wood finishes, dowels and clothes-pins, was thoroughly overhauled and converted to the manufacture of dowels and clothes-pins.

Most of the logs for these articles are brought in by water. During the winter when the lake is frozen and the raw material is hauled in on the ice, a convenient log haul-up is provided to carry the logs into the plant. Here a 60" Simonds saw is used to cut the logs into suitable lengths for the dowels and pins. The short pieces are now broken up on either a Ricker saw or an 8" Fay & Egan band saw. The Ricker saw is used on the smaller pieces while the band saw takes care of the heavier stock. The material for the dowels is cut into bolts and piled in drying sheds where it is allowed to season before being worked up. The rough stock for the pins is cut 5/8" thick and in lengths of about 4 feet.

The clothes-pins are made from the green stock and are turned on a number of Smith automatic lathes. After being turned they are passed to automatic slotters where the slots are cut. The next operation is to dry the pins. This is done in a large specially-constructed drier in which they are allowed to remain for five or six hours. The final finish is given in a large drum or tumbler which polishes and smooths. The output of the clothes-pin department runs as high as 300,000 pins a day.

In the dowel department 144 different sizes of dowels are manufactured, the sizes ranging from 3/16" to 1" in diameter and from 12" to 72" in length. The smaller sizes are run on a dowel planer while the larger stock from 1/2" up is manufactured by a battery of the latest type Hawker dowel machines. The output in dowels runs from 30,000 to 40,000 a day, depending largely on the sizes going through. About two and a half million feet of hardwood are worked up annually into pins and dowels.

The power for this plant is generated from the hardwood refuse, three 60 h.p. boilers, fitted with Dutch ovens, being installed. The stocking is entirely mechanical. The waste material is carried by branch conveyors to a main conveyor which conducts it to the furnaces. In addition a Sturtevant shavings exhaust system takes care of the righter material from the lathes and planers.



W. G. Clarke, of Clarke Bros., Bear River, N. S.

This firm takes a great interest in their employees and provide both housing accommodation and recreation. A number of families are living in the vicinity of the mill in houses owned by the company but a

greater part of their employees are accommodated in two large boarding houses operated by the company, one being for male employees and the other for the female workers. At present a fine moving picture hall and recreation room is being built. This will be for the free use of all employees and their friends. Pictures will be shown at least two nights each week and during the remainder of the time the hall will be available for reading, games and other social purposes.

In addition to the sawmill and woodworking enterprises mentioned, this company operate three lumber mills and electric light plant, a weekly steam packet service between St. John and Bear River, several small vessels for exporting the different products, and also repair blocks for wooden vessels. The new sulphate mill, which will be in operation shortly, will have a capacity of from 10,000 to 12,000 tons of sulphate pulp per annum.

The Engineer and the Woodworking Industry

Field for Development and Research Work Almost Unlimited—Manufacturing Operations, Standarization, Kiln Drying and Production Methods Require Special Consideration—Authorative Knowledge as to Value of Wood for Certain Purposes Required

By Thomas D. Perry*

Woodworking, one of the oldest civilized trades, is now one of the largest industries on the American continent. It is doubtful whether any other major group of modern manufacturers gives evidence of less scientific knowledge of its products. The reason for this is quite apparent.

Agriculture has been very slow in adopting scientific means to improve the efficiency of its workmen because son could easily follow father with no special training. Carpenters' sons could do likewise; hence, a few branches of rudimentary woodworking were not at all difficult to acquire. In each case one or two or a half-dozen men could complete the finished product and no extensive organization, capital or costly machinery was necessary.

The problem of the metal worker was far different. The necessary processes were complex and expensive. They demanded skill for the many necessary steps between the iron ore and the rolled boiler plate or the seamless boiler tube. It was therefore quite natural that the engineer was attracted to the intricate and involved problems of the metal worker, and that the metal worker, in his turn, felt the need of the trained scientist.

New Conditions Demand Improvement.

A survey, no matter how superficial, will demonstrate that, while the woodworker may not have needed the engineer in the past, he certainly needs him now. Raw material is increasingly more valuable; and wasteful methods are increasingly more culpable; labor requires higher wages; mechanical methods are in demand; manufacturing units are larger; need for co-ordination is more pressing; and output is more standardized. Proper adjustments to meet these conditions will permit larger and more intensive production.

The woodworker is by no means wholly to blame for not desiring or utilizing engineering knowledge. The engineer seems to have considered that such simple problems as those of the woodworker were beneath his dignity and not worth while. It follows, therefore, that if the woodworking industry and the engineering profession are to be of mutual benefit, a broader aspect and a complete readjustment of attitude are necessary.

It may be of interest to enumerate a few of the branches of the woodworking industry and suggest a few of the problems that need better solutions. The fundamental division is between primary woodworkers, converting timber and logs (natural growths) into lumber or some other form of raw material intermediate between the tree and the final product; and secondary woodworkers, who take the lumber and make it into pianos, furniture, caskets, house trim, etc. The problems are quite unlike, although there may be a few exceptions where the primary manufacturer still produces the finished product, as in the case of cooperage and flooring and many kitchen implements made directly from this log.

*Grand Rapids Veneer Works, in Mechanical Engineering.

Wasteful Methods Employed.

The sawmill operator has the problem of bringing logs to the mill, which includes hill and valley logging, land and swamp skidding, rail and water hauling, all more or less complicated by the rotation of the seasons and the variations of the weather. Considerable engineering skill has been shown in some of these problems, mostly, however, in the direction of machine design. The utilization of waste in such plants stands out as a gigantic travesty on the principles of economy. It is frequently said that steam power does not cost the sawmill man anything because he has plenty of waste, therefore, why watch the economies of steam consumption!

Nearly every sawmill has a large waste burner to consume the refuse so that the burning of the waste will not be an undue hazard to mill buildings and lumber yards. Temperatures of 800 deg. are not unusual in these burners. The better class of waste is put under the boilers and the remainder in the waste burner,(by means of which untold potential power is dissipated. The waste from trimming trees in the woods is left where it offers fuel for forest fires. In a few instances the author has known of the utilization of mill and woods waste for power production such as the manufacture of artificial ice in southern states and for making wood fibre for wrapping papers. These few instances, however, are exceptions to the rule of universal and unjustifiable waste in lumber production.

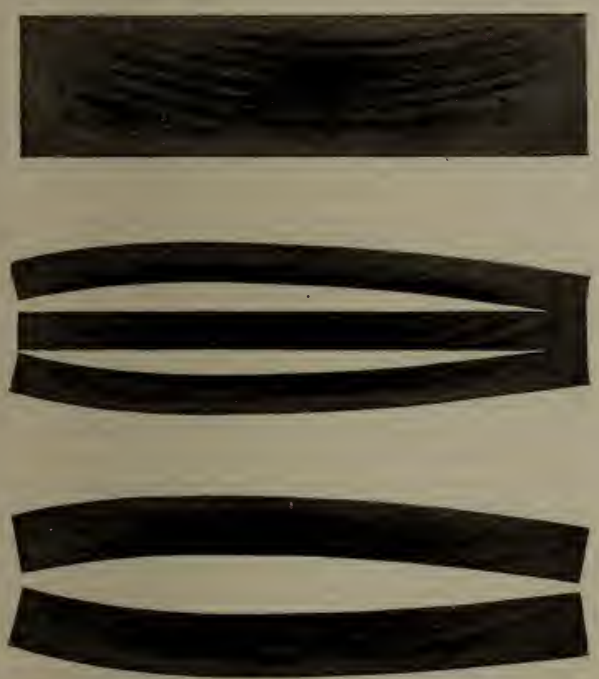
The rotary cutting, slicing and sawing of veneers is subject to all of the above problems, and in addition has several refinements such as preparing, cutting and handling thin and delicate sheets, selecting for figure, preventing discoloration, keeping flat, etc.

Drying Problems Require Attention.

Another question, which needs the attention of the engineer is that of artificial drying. The problem of establishing the conditions of heat and circulation are

not so difficult, but the tendency of the wood to dry too rapidly on the surface and establish internal strain is usually overlooked. The establishment and maintenance of a proper degree of enveloping humidity is the most difficult part of the drying operation, usually not appreciated by engineers. Of the various systems on the market each has its advantages: the blower types for veneer, finishes, glued work, etc., where there is no great thickness to be dried; the condensing kiln for the very thick and green lumber where plenty of time is available and careful operation possible; the ventilating type for speed and efficiency in the average plant of the majority of lumber producers and consumers. Artificial drying for piano actions, phonograph horns, and high-grade furniture requires a more refined process than that of general lumber drying. The opportunity for research and practical investigation along these lines is very great.

Cooperage, or the making of barrels, kegs, tubs, pails and casks, is in a very primitive condition and would completely discourage any engineer who might assume the problem of developing it. In a tight barrel the staves are first baked dry in a kiln, then machined to size and then assembled in barrel form and hooped



Moisture still remaining in centre of piece

for one-third of their length. The next operation is steaming to soften and render the assembled staves pliable so that the bulge of the barrel can be produced. When the hooping operation is completed the barrels, without heads, are set over little fires to again bake them dry. This process is only typical of others as crude.

Other Questions Must be Answered

The strength of timber of various species has been the subject of many tests under varying conditions, but a recognized standard compilation does not exist. The airplane has brought this subject prominently to the front, because the life of an airman or the success of his military mission would frequently depend on the reliability of wood parts. This phase of strength, recognized in only two of many uses, offers a vast field for consistent investigation and comparative study. What relation has density, or frequency of growth rings, or heart and sap wood to strength and elasticity? The authorities are few and their conclusions far from final. The tip of an airplane propeller moves at the rate of five miles, or 26,000 ft. per min. How can wood be made to endure this strain?

Wood is used in automobiles for spokes, felloes, bodies, top bows, dash boards, foot boards, running boards, battery parts, and sometimes for the all-important work of distributing the weight of body and engine on the axles. Authorities vary widely as to the merit of wood and steel wheels, and as to the relative comfort and durability of wood and steel trusses from body to axles. No conclusive authority exists for intelligent guidance. Airplanes and automobiles are not the only vehicles of transportation that use wood in large measure. There are wagons, buggies, freight cars, passenger cars, boats and ships in which strength and durability are absolutely essential in material design and fabrication.

Could Assist in Factory Problems.

Production methods or industrial engineering are hardly developed as yet in the woodworking industry. Factory equipment and systems are largely lacking in productive efficiency. The application of production processes which have proved successful in other lines than woodwork is hardly to be regarded as more than experimental in such a new field. The average woodworker has very little regard for the production engineer at the present time. However, there are developing here and there unrelated and unco-ordinated examples of scientific factory production. What better service could be rendered by engineers and engineering publications than to assist in standardizing and disseminating the best results? A few firms are specializing in this work, but there is available no supply of trained men from which to recruit their staffs of workers.

The foregoing is far from exhausting the list of the many opportunities in woodworking for suitably trained engineers. The demands for recreation and amusement require golf clubs, ball bats, billiard equipment, bowling-alley equipment, dominoes, checkers, chessmen, and gun stocks, all of which call for manufacturing efficiency in diverse lines. The domestic equipment of the average home embraces matches, toothpicks, clothespins, cutlery handles, churns, caloric cookers, hollow woodenware, rolling pins, potato mashers, broom handles, skewers, and many other articles. Each is made in sufficient quantity to occupy many factories and employ hundreds and often thousands of workmen.

The field for the engineer in woodworking is almost unlimited, but the development of such a new and untried line will take education, patience and adaptability on the part of all who are vitally interested in the trades that employ so large a proportion of our citizens.

Choice Lumber from Mahogany Stumps

The mahogany of Panama is a tree sometimes reaching a height of nearly 200 feet and six feet thick. It often grows in clumps so that it is not uncommon to find it to the number of 10,000 large trees to the square mile. Such a forest of mahogany, however, is rare, although there are occasionally places of this sort. As a general rule, the mahogany occurs in scattered clumps, so that an average of two or three such big trees as those above mentioned per acre is the most that timber men would expect to find.

Interesting Facts on Durability of Wood

Durability of Wood Controlled by External Influences—How Immunity from Decay is Usually Achieved—May Last Thousands of Years Under Favorable Conditions—Examples of Extreme Durability

By J. Hudson Davis, F.R.H.S.

Wood substance—the material of which the walls of the cells in wood are built—is one of the most stable of the innumerable varieties of organic compounds. No matter what the particular kind of wood—as oak, alder, birch, cedar, poplar, etc.—with freedom from specially injurious external influence each species alike appears to last indefinitely. Most organic bodies immediately life has ceased begin to putrefy. This putrefaction is due to the amount of nitrogenous matter they contain; and in exact ratio as the nitrogenous elements are present or absent, so the process of putrefaction goes on with greater or with less rapidity.

The extraordinary durability of wood is due to the nearly complete absence of nitrogen from its composition. Nitrogen constitutes considerably less than one per cent. of the total bulk of any wood substance. Wood is therefore not much subject to decay arising from internal weakness, nor from chemical changes like those that occur during putrefaction; while senility (or decay from age) of any part of the wood substance is practically unknown. The period of its life appears to be controlled solely by external influences.

What Causes Decay in Wood

Failure, when failure occurs, is nearly always due to one of three causes, namely: (1) To external chemical influences; (2) to mechanical, or physically disruptive influences; and (3) to the influence of a few of the larger and more voracious of the vegetable parasites. By chemical influences is meant that kind of influence by which wood is subject to the direct actions of corrosive liquids, vapors or gases. This often occurs in ordinary circumstances through the formation of sulphuric, nitric, and other acids, by the action of rain-water on various kinds of soil; and it also occurs by simple maceration. The wood in such cases is affected in exactly the same way as pulpwood is affected during the process of its reduction in the digesters, preparatory to its use for paper manufacture. That is to say, these chemicals render soluble certain of the wood elements, with the consequence that its general organization is broken down. Certain kinds of combustion, or oxidation, also come under this heading particularly the kind of eremacausis (or slow chemical combustion) to which the name wet rot has been applied.

By mechanical influences are implied abrasions and all manner of injuries arising through contact with other hard substances, or through the ravages of wood boring insects, or from splits, shakes, sun-cracks, and other violences against its natural constitution, whether they are due to changes in locality, to changes in temperature, to moisture, or to any similar cause.

The fungial parasites and their work are doubtless sufficiently well known not to heed a general description here. Now, these three influences are so persistently operative, and so vital in their results, that only on comparatively rare occasions do we find examples of ancient timber and woodwork that have not at any time been subject to their or combined effects.

Obviously, the greatest sphere for the employment of wood lies within the radius of a few feet above or below the surface of the earth; and, unfortunately for its longevity, within this radius also the destructive influences under discussion are found in their fullest activity. The earths surface the great field where innumerable natural chemical processes are constantly going on. And it is here, also, that the danger of attacks from insect life is greatest; and that injurious vegetable growths are most frequent in their occurrence.

When, therefore, examples of pieces of long preserved timber have come down to us, these have usually spent the period of their existence in some way outside the scope of the influences named. They are, however, none the less valuable on that account, as they teach us what are limits of possibilities with regard to the life of this wonderful material.

Immunity from attack, under natural conditions, is usually achieved in one of three possible ways. (1) The wood may be completed submerged in harmless liquids, usually in water; (2) it may be buried in a soil that is dry and not subject to extreme changes of temperature; and (3) it is equally lasting in ordinary atmospheres, if only it enjoys protection from the baneful influences mentioned above.

Authentic Examples of Longevity

As examples of the first of these conditions, the oak, beech, birch, larch, and alder posts and planks procured from the Irish crannogs and Swiss lake-dwellings are absolutely authentic. The wood procured from the Bavarian and Irish bogs and morasses furnishes another instance; a still more recent one being the discovery of a whole forest of enormous black walnut trees, submerged in the southern part of the State of Kentucky, in the United States of America. Other and oft-quoted instances are the piles of the Emperor Trajan's bridge across the Danube. These were of oak and alder, and after sixteen centuries of complete immersion, were taken up and found to be petrified for three-quarters of an inch on the external surfaces, but the rest of the wood was sound and good, differing little from freshly cut material. The piles of Old London Bridge, England, the canoes discovered in trenching through the Lincolnshire fens, and many other samples of the durability of wood under submerged conditions, are also extant. Perhaps the very latest is that of the discovery of the site of Charlemagne's bridge across the Rhine; the newly found piles of this bridge were withdrawn from the bed of the river and made into furniture about the year 1893. They furnished an exceedingly handsome wood of a dark brown or walnut colour. The wood was ordinary oak.

The durability of wood under the second of these conditions is to be found tested and proved in many parts of the world. Deep down below the surface of the ground, where chemical changes proceed slowly or not at all, where no harmful insects pentrate, and no injurious vegetation thrives, many forests of hard woods and of pine trees have lain buried for untold

ages of the past. Two examples may suffice in this connection.

Mining for Buried Forests

A short time ago the French Consul at Montgze, in Upper Tonquin, reported a very curious mining industry which is carried on in that district, and which, just now, represents a source of much wealth to the local population. This is comprised in certain mines where are found buried the gigantic trunks of pine trees which have been swallowed up in some longforgotten convulsion of nature. Many of the trunks are a yard and more in diameter, and the wood they furnish is said to be of an imperishable nature, and is, for this reason, much sought after by the Chinese, for making into coffins, etc. The date of the subsidence is, according to the latest computation, placed at 5,000 to 7,000 years ago.

Nebraska, in the United States, is the centre of a particularly forestless district amounting altogether to several thousand square miles. For many years past the efforts of the Department of Agriculture have been directed towards supplying this regrettable deficiency in tree-growth. Of the ultimate success of the planting experiments which are being carried on, many critics are dubious because of the excessive dryness of the climate. The authorities, however, are very hopeful from the fact that the district is not absolutely treeless even now, and the mining of enormous timbers out of the Nebraskan sandhill serves to indicate that this section of the country, at least, has not always been in a forestless condition. Here again the trees lie deeply buried, and consequently have experienced none of the destructive influences common to wood lying on the surface of the earth.

Will Keep in Dry Air

But the durable qualities of wood are equally remarkable when it is exposed in the air, providing only it is kept dry, and kept safe from mechanical and chemical injuries. The fungi will not attack it in a dry condition. The amount of nitrogen in its composition is not sufficient to promote their growth while the wood is in a dry state, and moisture in the air, as well as moisture in the wood, is essential to their life and well being. It is in the very large buildings that we most often find aged woodwork in a very good or perfect state of preservation. And then it mostly forms parts of roofs, high up from the ground, or is in some other way far removed from the disturbances incident upon everyday life. The reason for its good preservation in such situations is probably not difficult to find. Usually, much of the ground surface in its vicinity is paved in some way, so that the injurious chemical exhalations of the soil are wholly obviated or reduced to a minimum; and usually it is found in an atmosphere not congenial to or out of the reach of depredatory insect life. In some cases, no doubt, the natural secretions of the wood are in small measure an efficient protection; but the various phases of that subject cannot be taken here, and must now be left for treatment at some future time.

Early Egyptian Examples

In each of the following cases the third condition named above will be found to apply. Rondelet mentions the fact that the fir trusses of the old portion of the roof in the Basilica of St. Paul in Rome were made in the year 816, and in 1814 were still sound and good, having thus lasted just one thousand years. The timber work of the outer domes of the church of St. Mark at Venice were still in a good state when Tredgold wrote his work on carpentry. It was then more than 840 years old. There are many other examples similar to these, for instance the oak found by Mr. Woods, in 1871, on the pavement of the Temple of Diana at Ephesus; and the gates of St. Peter's at Rome. (These were of Cypress wood, and after being in use 600 years were still in perfect condition).

Egypt has furnished more wonderful examples still in the coffins, domestic apparatus, and furniture abstracted from the pyramids and other tombs of the dead. In the British Museum may be seen much old Egyptian woodwork, evidently wrought with very primitive tools, but still in a well preserved condition. It may possibly be true that the simple Egyptian workman had over much confidence in the supposed everlasting qualities of his material and workmanship; but it is after all astonishing to think that his sanguine ambitions have already been fulfilled to the extent of at least 4,000 to 5,000 years.

In this case, again, the wood has been preserved under conditions where no animal or vegetable parasites could thrive; the dry atmosphere and the sand of the desert preventing, to a large extent, much prolificacy of vegetable life, and the dearth of this latter being in itself an effective handicap on the prosperity of pernicious insect life.

Continuous Groove for Cane

Where woven cane is used on furniture, the method commonly followed in making the groove to receive it is to run the groove in the different parts before assembling. This work is usually done on the shaper. The two main objections to this procedure are that the cabinet makers are called on to finish the grooves at the corners and that this method makes shary or square corners, necessitating the fillets which are pressed down on top of the cane, to be accurately mitered and fitted. These operations consume considerable time.

Some of the more progressive furniture factories, where possible, assemble the parts first and run a continuous groove, rounded at the corners, on the shaper. This requires a little fitting up, but where the volume of work warrants the change, the saving in time will more than repay for the labor and material expended. First, a large sub-table is made and clamped to the top of the shaper. A hole in this wooden table permits the spindle, with router screwed in the end, to project up through. Next, a wooden block with groove and hole is fastened to the centre of the wooden table. The hole, which is near one end of the block, fits down over the projecting spindle. The depth of the groove is regulated by raising or lowering the spindle until the router projects through the block the required distance. A small moveable block with guide-pin attached is fitted in the groove in the larger block. The guide-pin should be higher than the routing tool so that the work may be started without running the risk of spoiling it. This small block with guide-pin is adjusted so that the pin is the proper distance from the cutter and regulates the distance of the groove from the edge of the piece. The inside edge of the open piece is run over the cutter, using the pin as a guide. The work should be moved at right angles to a line adjoining the pin and cutter. Where a corner is reached, the work is swung aroung, using the pin as a pivot, thus making a nice round corner. This block should be sufficiently high for the work to rest firmly on it at all times, even when working to the centre of a curved top rail for a chair. A continuous groove, such as this makes, is ready for caning without further cleaning.

Fear Has No Place in Business

Fear is a timidity grown up. It is a paralyzing force which enchains us. If we are constantly afraid of some evil befalling us, it is almost sure to overtake us in time. Our very attitude of mind courts the coming of that disaster, says the "Paper Trade Journal."

The man who is afraid of taking any responsibility, will always be an underling. There is an old saying that "He that fears leaves, must not come into a wood." And the man who is gunshy of obligating himself of any regular duties, or the meeting of definite financial obligations will never adventure very far and never grow very rich.

A certain amount of fear is given to us for our protection, but that fear is only in the nature of caution. It is to prevent impulsive and over-hasty action. It is always undesirable that we should have about us anyone who fears us, for again the old maxim speaks truly when it says, "He that fears you present, will hate you absent." Hatred is to be avoided, for thoughts are things. It is much better to have people work for us because they want to, than because they have to.

As a rule, it is much wiser for us to stop and examine the thing which awakens fear within us. The ghost with the up-pointing finger by the woodshed door, proves to be nothing but an old tree with a bare limb. The mysterious footsteps on the porch outside, are the night noises in the maple which oerhangs the porch. The terrible financial disaster which we see approaching, and which causes us to tremble, is likely to prove a mere scare head, if we walk right out and meet it. Certainly nothing is gained by running to cover.

The man in business to-day has to have his nerve right along with him. He cannot be ready to back water at everything, or to shrink into himself at the approach of the first obstacle. What appears to be a big difficulty, may prove to be a very small one or none at all.

One of the surest ways to overcome fear or a natural tendency to fear, is to associate with strong, successful, aggressive people; to read biographies of those who had achieved surprising things in the face of many handicaps; and to cultivate the habit of overcoming our own mental confusion.

Have you ever stopped to think that the reason we are afraid, is because we suffer from idea-rout? That is why we become frightened. Our calmness, our poise, our clarity of thought are dissipated by something which disturbs us, but once we get right hold of ourselves and realize the truth, we cease to be frightened. The big man of whom we have stood in awe, is likely to be the simplest, the most human and the kindliest of fellows. Fear of a financial panic which perhaps has kept us awake nights, is just what lots of people have been waiting for, knowing that it will give them opportunities to get rich, for a single dollar then may develop the purchasing power of two dollars.

The big deal into which we have been afraid to go, loses its terrifying aspects when we consult a banker and perhaps our lawyer, and realize where we can safeguard ourselves completely against loss.

Have a little faith in yourself. If you do not believe in your own powers and ability, you must not blame other people if they doubt them, too. Live a life of such uprightness, industry, square dealing and the prompt meeting of your obligations, that you can look every man in the face without being afraid of any of them. Then you can go blithely out, knowing that you have as good a chance in the world as any man.

Attractive List of Equipment

An attractive list of bargains in reliable woodworking machines is to be found in the advertisement of The Osborne & Sexton Machinery Co., which appears on the inside back cover of this journal. This list, which consists of both new and rebuilt equipment, contains items of interest to all branches of the woodworking industry. Among the machines offered are moulders, boring machines, tenoners, window frame machines, sanders, planers, mortisers, nailers, saws, glue spreaders, shapers, etc., in well known makes. A special bargain is being offered in the shape of a number of, new, Yates automatic knife grinders, 36″ and 66″, at one-half the regular price. This should prove particularly attractive to anyone in the market for a machine of this type. If you are considering adding to your plant it might be to your advantage to consult this firm.

What's Going to Happen to Wages?

Everybody is asking if wages are going to go down. No general answer can be given to this question, covering the next four months. In the building trades a trimming of the peaks is likely. Men who are getting $1.25 per hour, as they do in a few cities, may go to work for $1.00 or for $1.10 rather than stay idle. The same may happen in textile and knitting shops. In short, the place to look for wage drops are the places where wages have shot up the most. In the face of what is likely to be a level living cost, we cannot look for general reductions in the wage rate. During the past three years there has been a very general tendency to relate wages to living costs. Labor and employers, alike, have accepted this idea. If, as seems likely, the present slackening in business and falling price level is really the beginning of readjustment, then by next spring we should be able to hold new agreements to the levels of the old ones or to effect reductions in some lines.—Babson.

Does Accident Prevention Pay?

If a laborer earns $1,000 per annum in a city, he spends the same amount in caring for his family. Fifty thousand laborers at $1,000 per annum means $50,000,000 circulating in the channels of trade and commerce, and the banker, the butcher, baker, the candlestick maker, the insurance man, the preacher, the teacher, and every man not engaged in labor for wages, are dependent upon this circulation of money in order to ply their respective trades and professions. If by lack of systematic accident prevention, a community causes or contributes to the death of a wage earner, that community does not only lose the amount of his earnings, but the community as a whole goes into its pockets to provide housing, sustenance and education for the family of the man lost by accident. It seems perfectly logical to spend at least part of the moneys now used in keeping up the eleemosynary institutions, on systematic accident prevention in a community, and we should place safety education work upon the same plane as the work of the public health and other educational activities.

Requirements of Box for Export Service

Many Commodities Difficult to Pack — Faults Encountered in Boxes— Best Workmanship Required—Choosing Suitable Material

By Malcolm W. Hill*

Exporters who ship peculiarly shaped containers which have by long association with their product a certain trade value will probably continue to retain the same shape bottles or other containers, but they will at the same time have to put up with a certain loss due to the unsuitability of this container for the hard usage common to export shipments and the added cost and difficulty of packing that commodity safely. Through habit and carelessness many very inefficient packages are thus made up by the million each year and it would be very well worth the time and money if through publicity this bad practice could be discarded.

Mr. E. H. Bell, of Philadelphia, suggested a different package for canned goods which are now packed 24 and 48 in a case; by his method 50 and 25 cans could be placed in the same cases with a great saving of space and material. He states that if a somewhat larger box than the regular export No. 3 box were used, which has a cubage of 1.6, the larger box with 1.86 cubic feet would reduce the number of cases over 53 per cent. and the space saving would be some 160,000 ship tons, with a saving of $4,000,0000 in costs, involving some 40,000,000 feet of box lumber.

Using Suitable Lumber.

In connection with the shipment of condiments in glass bottles if the manufacturers would use a bottle that would nest better when in the cases an enormous saving in cost of packing and very large reduction in damage would be effected. I have noted that a very large proportion of United States specifications for boxes require white pine, and it seems that as many of these boxes are of a type which are used for storage purposes that other and harder woods would not only make more durable boxes but release the white pine lumber for other purposes that are more suitable.

With regard to the relative strengths of plain and tongue and groove lumber for export boxes, the latter will have a considerable additional strength in service if glued but not so much unless the lumber is well dried as the joints will split open. With the Linderman jointing done properly there is no reason why narrower lumber cannot be used to advantage; the New England box material is exceptionally narrow and knotty but with proper handling there is no reason why this material should not make a very satisfactory box.

A good deal of comment was made as to box lumber being made of timber cut at the wrong time of the year, but the time it is cut is not very important if the timber is cared for properly. Of course in hot weather there are more insect enemies but the sap content except for certain uses such as posts and poles that are set in the ground should have small influence. The real danger in hot weather is the checking from too rapid drying.

In lining export boxes, great care must be taken that the paper is not punctured or torn and so the box maker must see to it that his made up export boxes are as smooth and clean as possible on the inside. Every package may have to fight rain, sleet, dirt, oil, damp, moths, rats, etc., so any added protection against one or more of these things is worth while in export boxes.

Consider Package as a Whole.

Consider your package as a whole; if the contents are valuable place more care and money in a suitable shipping case, it may be that other poorly prepared shipments may burst and leak over yours, acids, syrups, glues, etc., are only a few of the many things that may play havoc with your package if it is not well cased and protected—so a tight box is always a good investment unless of course the contents are of a nature that must at all times have ventilation — then special precautions have to be taken. The customer always likes to have his shipment come out of the case clean and fresh and if they do not you are sure to hear from it and perhaps lose the repeat order.

I believe that with education as to the hazards of overseas shipments, exporters will use fewer crates and more boxes as the added cost of the boxes will in many cases be overcome by the reduction in claims for losses in handling and transfer.

The pilfering of shipments is a most vital consideration and the well made export case properly strapped offers the best and most reliable solution to this very serious problem of the seeker after foreign trade.

Faults Commonly Encountered.

To give an approximate idea of the common faults observed in boxing by our inspectors in the packing service I will read the percentages of same derived from study and tabulation of a large number of inspection reports

Improper design of box or crate to get best results, 56 per cent.

Waste space in same due to improper design, 43 per cent.

Strapping unsuitable or improperly applied, 43 per cent.

Marking incomplete or improperly done, 51 per cent.

Nailing bad, too few nails, improperly placed, etc., 32 per cent.

Lumber trashy, wormy, unsuitable for the purpose, 34 per cent.

The subject of the use of wormy or beetle shot lumber is one that must be given study, there is no question that in some countries the wood with worm holes is looked upon askance, as it may introduce insect pests. This matter has been studied by experts and they say that under most conditions this danger is very remote. Be this as it may, the effect upon foreign buyers must be studied and with valuable packages it is most sure that the cases should be of absolutely sound lumber and well appearing from all standpoints. The question really rests with the purchaser in many instances and it will do no harm to raise the point when the type of packing and size of packages is discussed to bring up the matter of very common wormy and pecky lumber for use in cases and let a frank statement of prices be thrashed out. The export box stands alone

*Extracts, address before N. C. Pine & Shook Manufacturers' Association.

for best workmanship and materials and it should never be placed on the same plane for costs as those containers that serve for local shipments and which are not expected to have the hazardous experience that the average export case receives.

Certain Woods Not Appropriate.

Our diminishing lumber supply demands that we conserve those woods best suitable for building construction for that purpose, but there are a great many woods that are entirely appropriate for box-making that are not used often enough and this matter is one that should be given our best thought and study.

It is only a matter of time when the collapsible container will be used, as the rising cost of boxes will before very long make the re-use of shipping cases an economic matter of no mean importance, and in this field the combination of wood and steel for containers will receive more attention.

The great value of the tests that have been made by the Forest Products Laboratories in determining the different physical properties of many common American woods will be realized in the coming studies of box substitutes for the most needed structural varieties.

I will conclude my paper with some notes taken from reports of officers and inspectors at ports both on this side and in France.

The following is from Norfolk during October, 1918:

Boxes—Hardly any box is according to specifications. Nearly all boxes do not have a sufficient number of nails. Many do not have the right size nails. A great many nails are overdriven one-third to one-half the thickness of the material. Brash wood, rot, knots too large, etc., have been observed in too great abundance.

Many shippers still try to mark their packages on undressed lumber. Common fault is too much weight for the thickness of the material, sides bulge and break out. Much cheap binding is done. Straps in many cases too soft. Marking many times poorly printed on straps on long boxes not spaced right as a rule. Skids not used often enough on heavy boxes, neither are internal braces used often enough. Sides of packages crushing when handled by cargo hooks. Many cases of boxes with useles outside battens.

The following should appeal to boxmakers:

Objection to Fibre Containers.

Canned or preserved fruit in glass should be shipped in wood containers with packing between each jar and on the sides, ends, top and bottom of inside of box with an extra thickness as a cushion on the bottom. Fibre containers are very objectionable and should not be used. If one jar is broken the fibre becomes wet and the bottom usually drops out and the package is beyond repair.

Aside from unavoidable accidents which will happen—there are three real causes for the greater part of our egg losses and these are easily avoidable—they are: Poor marking, poor packing and rough handling.

Fresh fruit or vegetables should be packed in wooden containers made of material of strength sufficient to stand at least seven times the gross weight of package, for the reason that with car shortage it is often necessary to stack fruit up in the cars seven to nine feet high.

Crushing frequent in heavy cases due to use of single slings used in cargo hoisting—to prevent slip the sling is shortened as much as possible—with the result the upper members of the package are crushed at the point of sling suspension.

Heavy freights are spotted or skidded to final locations in hold or on deck by the easiest means always, frequently fastening lines or cables to individual member of crates and cases and often causing great injury to packages.

Long cases often piled in holds with too great overhang of parts of their length, leading to permanent distortion of the case and probable collapse later.

Boxes of considerable weight and piled in tiers too often upset tiers at a time and allowed to tumble from considerable heights to stone or concrete floors with much damage to many cases.

Many wire-bound cases seriously injured by the feet of workmen walking over the piled cases and crushing members.

A Few Cost Suggestions

By A. J. Redemski

In the box industry, cost work should be called upon to serve two distinct functions. First: it should provide a basis for estimating so that every item of product, irrespective of its shape, size or quantity, may be marketed at a profit. Second: these estimates should be so controlled that their effect may be reflected in the books of account and their accuracy made a matter of periodical revision. In this analysis the material, waste, cost of every factory operation and overhead should be included.

Material constitutes the largest single item of cost. Stock records should be kept to reflect its cost per unit, as well as the quantity of the several items on hand from time to time.

The principle of costing lumber into box factory production at its replacement value rather than at original cost is generally conceded as good practice. In fact it has only been disputed by some on a rising market, but in a declining market competition usually forces the issue. The loss or gain resulting from this treatment of lumber should be separated from the box factory operation. Under rising market conditions a very satisfactory profit may be shown, but strict analysis might disclose the fact that this was due entirely to the enhancement of lumber values and that the manufacturing processes have been conducted at a loss. In times less prosperous than these losses might be more promptly traced by this means than would otherwise be the case.

The item of waste is a factor which has given every box manufacturer a great deal of concern. Its analysis and possible reduction may mean added profits in more directions than one. A casual glance at the refuse box on its way to the boiler room may not cause concern, but a rising percentage reflected in the accounts from month to month will attract attention. Reduced waste means increased production, which, in turn, has greater value than firewood. Under certain conditions the utility of one grade of lumber over another, or certain lines of product over other may be demonstrated.

Manufacturing costs do not rise and fall in the same ratio with the footage of material in a box, hence the board foot basis of estimating does the box manufacturer an injustice in many instances. Size, quantity and details of construction all contribute to a state of confusion in this respect. Each process is worthy of careful analysis and classification so that proper charge may be made as each individual contract or specification warrants. When these process

costs are linked with the estimates made, losses will be averted before they occur.

When material and labor have been properly accounted for in the estimates only a part of the cost of production will have been allocated. There yet remains the overhead or burden. Means should be devised which will permit the spreading of this element against the product at a standard rate. Extraordinary expenses arise from time to time, which, if allocated against the current product, throw those costs out of proportion.

Were a programme along these lines adopted by the industry as a whole, great strides would be taken toward freeing the trade from unfair competition, in so far as such competition is brought about by the lack of proper cost knowledge.

Boxing and Crating Courses

Our readers are reminded that the practical training courses in boxing and crating at the Forest Products Laboratory, Madison, Wisconsin, will continue throughout the year on the following dates:

First course November 1-6.

Sixth course December 6-11.

Manufacturers and shippers are taking advantage of this opportunity to train their men. Priority of application governs admission, and applications should be made well in advance.

Purely Educational

Even the daily papers are looking to the education of the common people and as a part of their efforts have a daily "Quiz" on Historical, Geographical, etc., subjects. The Editor of the "Wood Box" is determined to be up to date, hence the following:

Question—What kind of lumber is produced from the hemlock tree? Answer—Spruce, pine, and a few other species, including an occasional piece of hemlock.

Question—What are the most common methods of figuring manufacturing costs? Answer—(1) By estimating how much cheaper you can operate than a competitor who has quoted a customer, perhaps. (2) By use of the Ouoja Board. Either method is equally accurate.

Question—What is a corrugated fastener? Answer—A crinkled piece of metal driven into boards so as to interfere with printing—sometimes inadvertently driven so as to fasten two boards together.

Question—What is a saw kerf? Answer—The place where the sawdust used to be.

Question—What is a competitor? Answer—An unspeakable person who is continually selling boxes at less than cost, and who, though headed for ruin, seems to be able to buy a new car each year.

Question—What is a salesman? Answer—A misused human being who could keep the factory operating overtime, if allowed to meet competitors' prices, and if business wasn't always rotten.

Question—What is a lumber buggy? Answer—An insect which eats holes in lumber. Some holes are knot holes and some are not.

Question—What is a nailer? Answer—One who spends part of the day driving nails and the balance driving an oil chariot.

Question—What is a profit? Answer—A rare thing which box makers hope is hidden in prices but which is rarely found there.

Question—Who was the first box-maker? Answer—History doesn't tell but it might have been Nebuchadnezzar—something drove him crazy.

Corrugated Joint Fasteners

Although corrugated fasteners are being used more and more extensively in woodworking industries, and are indispensable where a tight, strong joint is necessary, it is astonishing to note the number of woodworkers who ignore them and their numerous advantages. These fasteners are made of bright steel with sharp penetrating edge. They can be readily driven into hard or soft wood irrespective of the grain, the corrugations interlocking with the wood and holding it firmly together.

Corrugated fasteners are made in two styles, plain edge and saw edge. The sharp cutting edges make them easier to start and drive and the clean throat between the points prevents the crushing or breaking down of the wood. They are sold not only to lengths but are furnished in coils for use on automatic driving machines, which can be obtained from different makers of woodworking machines.

The following table illustrates the size of fastener to be used in various thickness of wood:

		Fasteners.
1/4	Lumber	1/8 Plain Edge
5/16	"	1/4 Saw Edge
3/8	"	5/16 " "
7/16	"	5/16 " "
1/2	"	3/8 " "
9/16	"	7/16 " "
5/8	"	3/8 or 1/2 " "
11/16	"	9/16 " "
3/4	"	5/8 " "
7/8	"	5/8 " "
1 in.	"	5/8 " "

Of course corrugated fasteners must be made of the right kind of steel not too soft nor too brittle, otherwise they will break when applied to wood. Therefore, it is important that the user secures a good quality of fasteners.

The following is a list showing some of the uses for the fasteners: Boxes, trunks, built columns, bee hives, irrigating pipe, all kinds of furnitures, panels for portable houses, bath room fixtures, cooperage heading, picture frames, screens, toys, fruit packages, coat hangers, piano boxes, pattern working and cores, kiddie kars, washing machines, phonographs, refrigerators, signs, incubators, gun stocks, show cases, shooks.

It is advisable that the box makers use and adopt these corrugated fasteners to make their product pilferproof, and it is to be hoped that all woodworkers adopt, without hesitation, the use of corrugated fasteners for their respective works, thus making a higher quality product to their own benefit.

Drawer That Will Not Jam

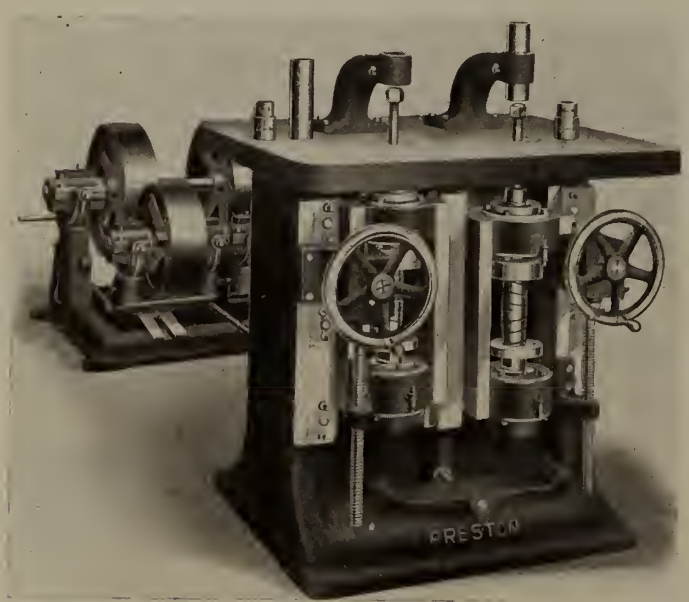
A new anti-friction roller for furniture that has sliding parts, is described by the Scientific American as a simple contrivance with a cylindrical steel roller which sets in a circular frame that fits perfectly into a five-eighth inch auger hole, and has a flange that holds the roller one-sixteenth inch above the surface. The device is designed for use as a bearing for dresser drawers, extension tables and other articles of furniture that frequently cause trouble and give annoyance because of a tendency to stick.

When hurry interferes with safety, cut out the hurry, says the Safety League.

Machinery & Equipment

New 11,000 R.P.M. Shaper

One of the newer products of the Preston Woodworking Machinery Co., of Preston, Ont., is the shaper shown in the accompanying illustration. This machine is designed primarily for the quantity production of small pieces such as brush handles and other small work. It is designed to run at the unusually high speed of 11,000 R.P.M. This speed not only materially increases the productive capacity of the machine, but enables it to turn out very smooth work, so smooth that little or no sanding is required. The high speed is made possible through a new application of ball bearings, something similar to the one shown in figure 3, on page 71, of the September "Canadian Woodworker." The cut used in that article is reproduced here, to give an idea of the type of ball bearing application used. The chief difference lies in the fact that the thrust is carried on a single ball instead of on a radial ball bearing, as has been customary. Another feature is that the pulley is held in place against shoulder, on the shaft, by a large nut at the bottom. This tends to reduce vibration as a key will cause a

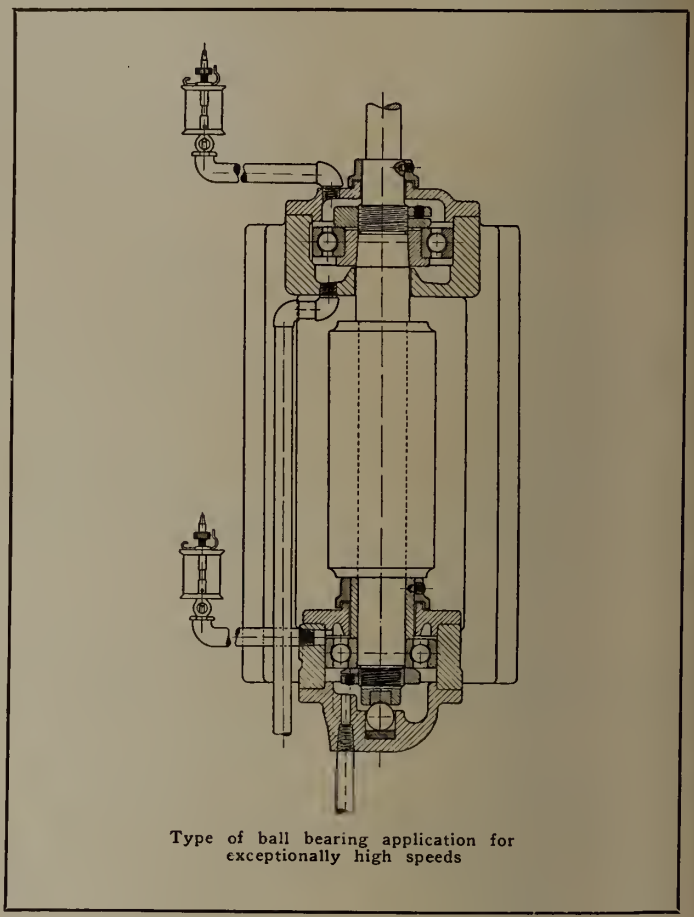


Preston high speed shaper for quantity production

certain amount at high speeds. The bearings in this machine are all S.K.F., including ball bearings in the loose pulley on the countershaft.

This shaper is made with 12, 14 or 19 in. spindle centres or may be had with centres to suit the requirements of the user. The brackets shown behind the spindles carry form guide collars. The ordinary form is used and is worked against these guide collars which do not revolve. This eliminates the necessity of working the form against the spindle and also does away with all friction, thus tending for better work.

In connection with the ball bearing application, it might be well to mention that nothing is gained by running the bearing at a speed lower than that at which it was designed to run. A ball bearing application will give better satisfaction and last longer if run at the R.P.M. for whch it was designed. Full particulars of this machine may be had by writing the Preston Woodworking Machinery Co., of Preston, Ont.



Type of ball bearing application for exceptionally high speeds

Grinder for Cutter Heads

To secure the best results from Shimer cutter heads, the bits must be ground and set with great accuracy. The grinder illustrated herewith has been designed by the Shimer Cutter Head Co. of Canada, Limited, for grinding the Shimer cutter heads. It is mounted on a pedestal for convenience and accessibility. The machine is provided with a vertical screw operated with a hand wheel for raising and lowering the main carriage. On the vertically adjustable carriage there is another carriage having a lateral adjustment at right angles, operated by means of lever and rack and pinion. The stub for holding head is attached to the latter carriage. The stub is turned to obtain the angle for grinding the cutter and is locked at any angle desired. To obtain adjustment for hook a movable frame is provided, which carries the arbor and emery. This is adjusted by a hand wheel operating a screw. The adjustments provided are so complete that the wheel may be placed where desired. At the rear of the machine will be found a tracking device by means of which each bit is placed in proper

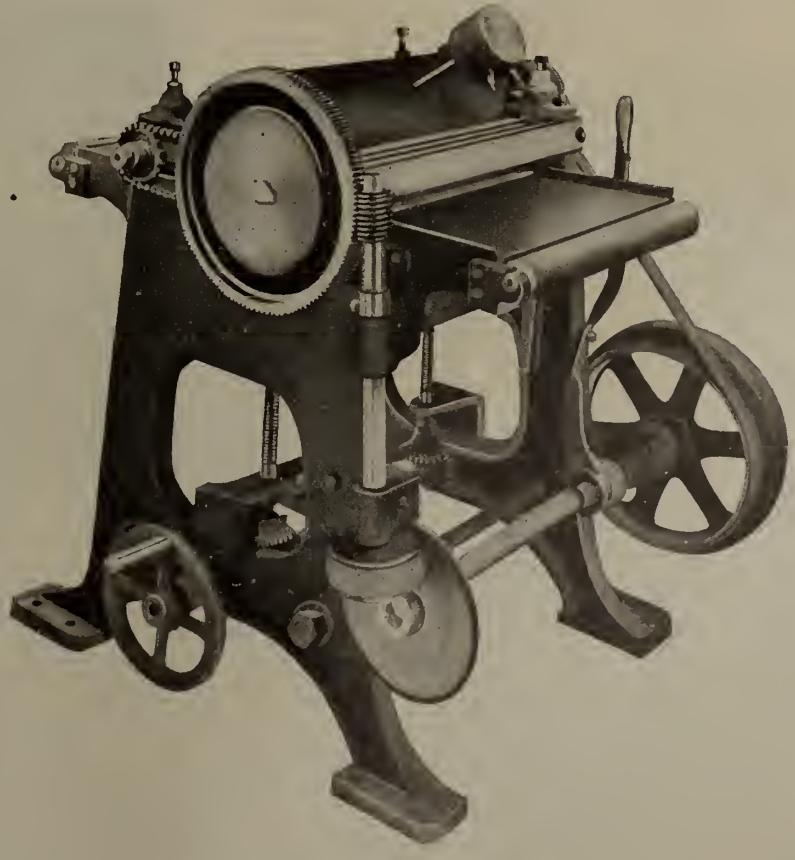
Pedestal grinder and tracker for Shimer cutter heads

cutting position from the centre. A disked emery wheel is commonly used, the wheel running at 2,000 r.p.m. Full particulars may be secured from the Shimer Cutter Head Co., of Canada, Limited, Galt, Ont.

Small Pony Planer

The small pony planer, shown in the accompanying illustration, has recently been placed on the market by the Elliot Machinery Co., Limited, of Belleville, Ont. It was designed for use with their well-known combination woodworker, but can be used separately. It should be found very handy for patternmakers, cabinetmakers and small woodworkers. The capacity is 16 in. by 6 in. with a feed varying from 18 to 22 feet a minute. The machine is very sturdy in construction and while not designed for heavy work, will do most of the dressing required by contractors in building homes and interior fittings. Little power is required to operate, from 1½ to 2 h.p. The cylinder is driven 3,400 r.p.m. It can be run from the motor ordinarily furnished with the Elliot woodworker but if desisred for belt drive a counter-shaft may be secured. Both the top rolls are driven and a novel feed drive has been worked out. Instead of the train of gears usual to such machines the rolls are driven by worm gear and friction drive. The reduction is secured by means of the worm. A clutch, operated by lever conveniently located, controls the feed. Full particulars may be secured from the makers.

A London Daily Mail reporter has located the whereabouts of Dr. Rendell Harris' alleged discovery of part of the hull of the original Mayflower. It is in a barn attached to the old Jordan Hotel in the Parish of Chalfront, St. Giles, Buckinhamshire. Beams in the barn are believed to have formed part of the hull and back of the Mayflower, and have been sold to the original Jordan by a shipbreaker in the seventeenth century.



The new Elliot Bull Dog pony planer

Upholstering and Trimming

Ford Plan Adapted to Upholstering

Strike Assisted Manufacturers in Putting Scheme into Effect—How System Was Carried Out

By E. S. Blanchard

Few strikes benefit anybody. Manufacturers lose in production, strikers lose in wages, and the public suffers from lack of goods. However, the strike of upholsterers in Chicago last fall has turned out to be a blessing in disguise. In its broader aspect, this strike was an absolute defeat for the closed shop. It completely shattered the upholsterers' union in Chicago, and it paved the way for the defeat of the unions in other furniture centres.

This story concerns the method of fighting adopted by the Valentine-Seaver Company, and the wonderful work accomplished. During the past six months, with an entire force of apprentices to start with, as much work is now being turned out as in the past with its experienced upholsterers, and better work is resulting, as will be explained later.

Few Experienced Hands

When the forty-odd upholsterers walked out last August, it left the company with a force of cutters, shipping room help, office force, and three men who knew upholstering. The foreman had had long experience, the foreman of the cutting room knew the trade, as well as the assistant shipping clerk. These three men were the principal assets of the company at that time.

For a month or so, while things were developing, they kept up a small part of the output assisted by a few loyal workers. Then they laid plans to settle the thing. They advertised from time to time for young men who desired to learn the trade, and about 300 responded. Most of these were impossible, but the group was finally weeded to about fifty-five, and the wisdom of the seletcion made has been shown by the results attained.

Work Divided Into Units

The processes were next divided into units—"webbing," "springing up," "stitching burlap," "arm, seat and backs," and "trimming." As the plan has worked out, one man is webbing for the entire force, seven do the springing up, three stitch burlap, four do the trimming, and the balance make seats, arms and backs. It is the "Ford" plan adapted to the upholstery business, and meeting with the success that plan has demonstrated in so many industries. Of course it would have been impossible under union domination as union rules require that one man complete his job from start to finish, and that no piece work be done.

Although the foreman was kept pretty busy teaching all these men the trade, his work was greatly simplified by the unit plan. If he had been forced to teach every man every step in the craft, it would have resulted in confusion and a great waste of time. But by specializing, and a careful choice of prospects, practical results were obtained in short order.

The apprentices were started at a uniform minimum of 37½ cents an hour, but were allowed to increase their pay as rapidly as possible on the piece work basis. Some are already making from 85 cents to 95 cents per hour. The company gets what it pays for, and the men retain their self-respect by earning what they receive. This would have been impossible had the union demands been complied with.

When a visitor passes through the factory, two things impress him: First, the intense interest shown by the men in their work, and second, by the youthful appearance of the workers. The average age is about 23—young blood full of life and "pep," ready and anxious to work like "the old Nick"—not through any altruistic motives, but for what the pay envelope contains. It was very refreshing for the writer to visit this factory and see a real old-time "American sweat"—he has seen so few of them in recent years.

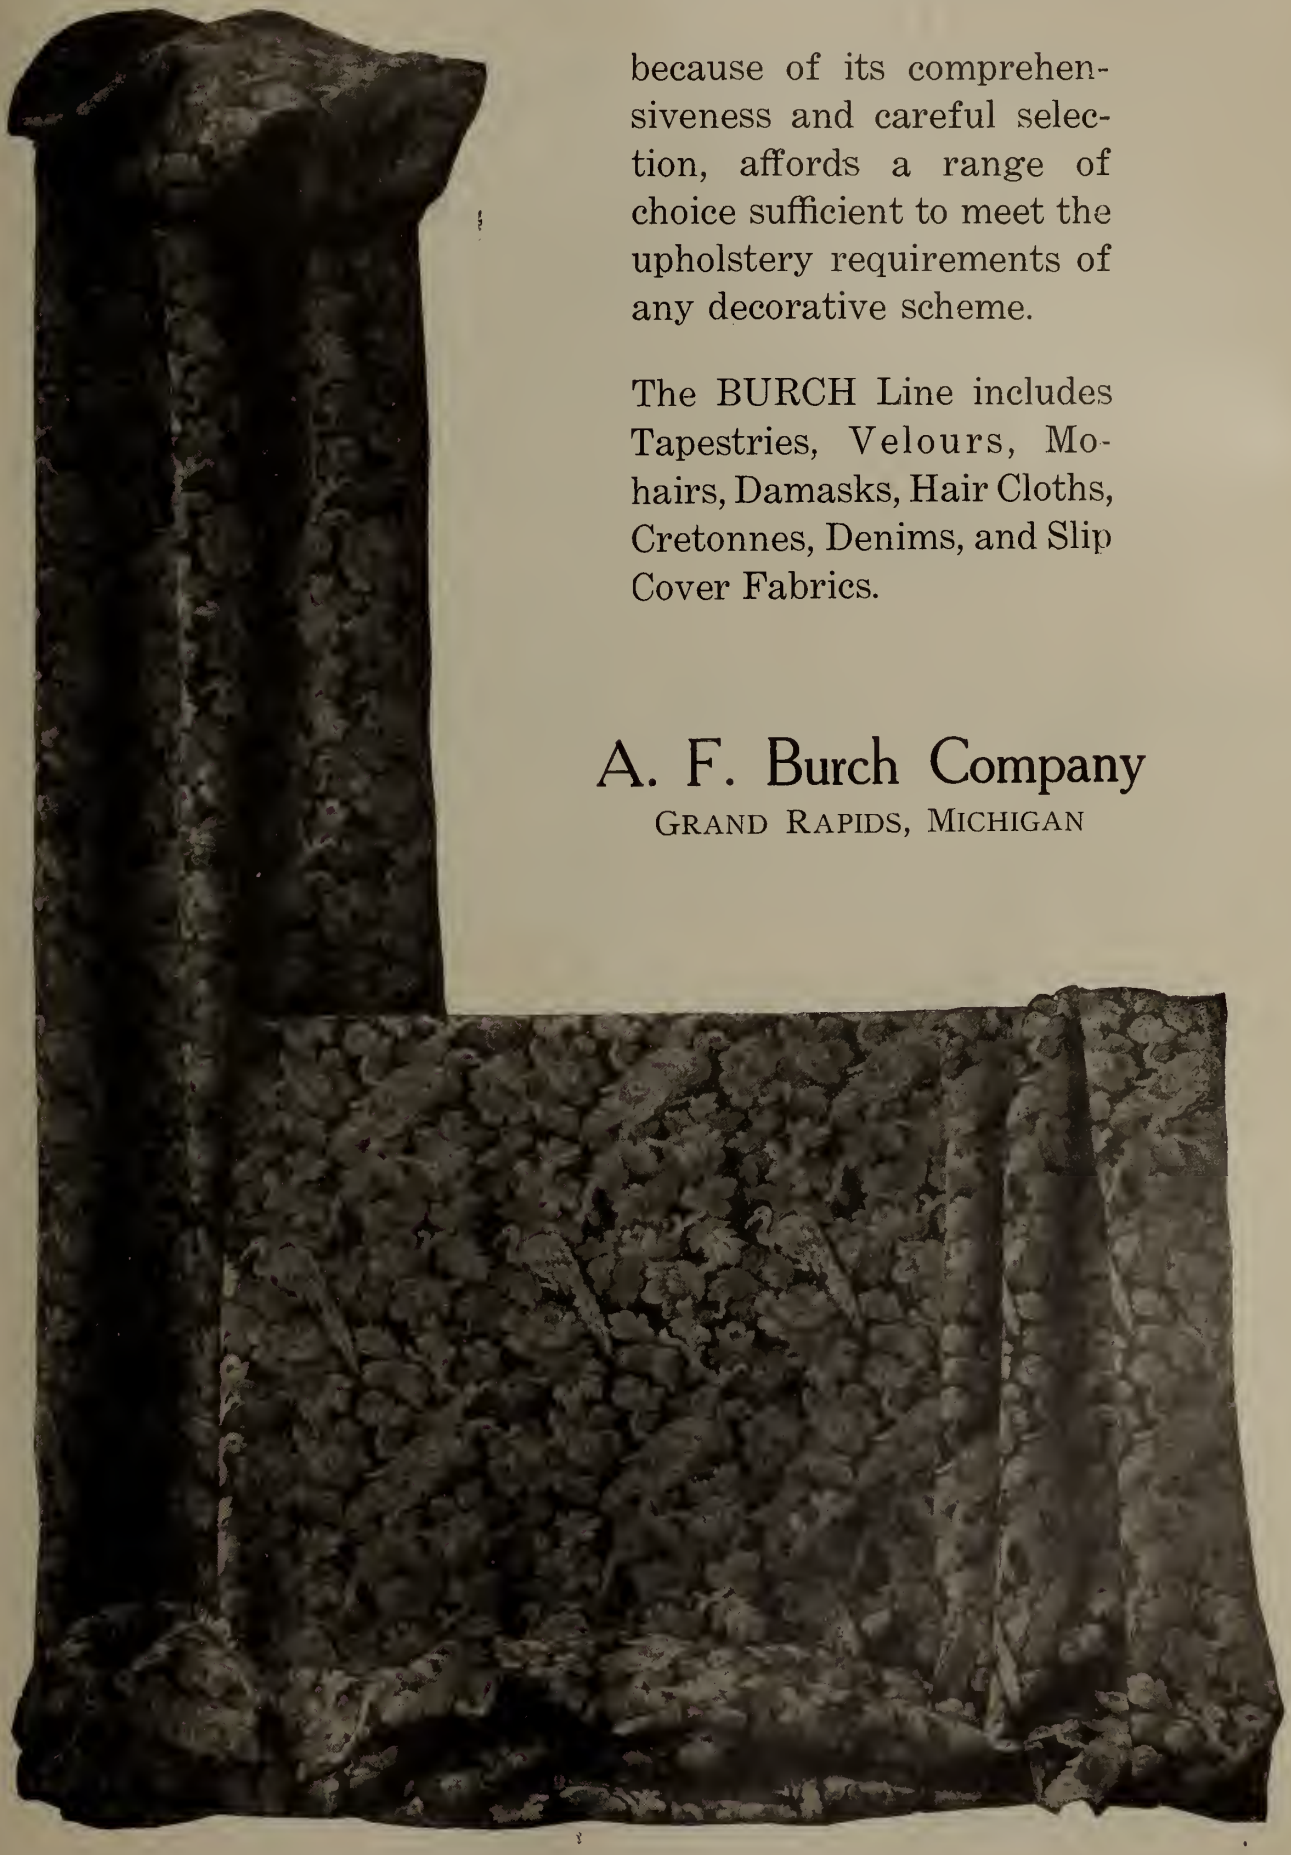
The Valentine-Seaver Company is working on the forty-eight hour basis, but putting in fifty-two hours a week, with time and one-half for overtime. Some of the men are so interested in their work they put in an hour or so overtime each day—voluntarily.

As was intimated at the beginning, the advantages accruing to the company from the action of the strikers are many. In the first place, it gave them a chance

Suggestions for speeding-up webbing operation

to introduce the unit system, which is the only system possible for rapid production. It put new life and new blood into the enterprise, which is certainly a good thing in any business. It made for better furniture, as the pieces are inspected as they progress, and no half-tacked or half-tied jobs can get by. And finally, it demonstrated once and for all that the only plan is the American plan. It showed the closed shop advocates that they cannot tie down a progressive institution, and if the present crew was to be affected by the union virus, the same system could be repeated and the business kept going.—"Furniture Manufacturer and Artisan."

THE BURCH LINE



because of its comprehensiveness and careful selection, affords a range of choice sufficient to meet the upholstery requirements of any decorative scheme.

The BURCH Line includes Tapestries, Velours, Mohairs, Damasks, Hair Cloths, Cretonnes, Denims, and Slip Cover Fabrics.

12 Principles of Industrial Relations

Referendum Vote Taken by the United States Chamber of Commerce

Overwhelming approval of a platform setting up twelve principles of industrial relations has been given by the membership of the Chamber of Commerce of the United States in a referendum vote.

The vote was on the report of a special committee of the Chamber's board of directors. This report went deeply into the subject of the employment relation, and recommended among other things recognition of the right of open shop operation and the right of employers and employees to deal directly with each other without participation by outside interests.

At the same time the Chamber's membership in another referendum vote has approved a report of its Committee on Public Utilities recommending that strikes by public utility employees should be explicitly prohibited, and that tribunals should be created by law to adjudicate in decisions between public utilities corporations and their employees.

The vote on the two referenda was the largest ever recorded by the Chamber on any subject.

The twelve principles of industrial relations advanced by the committee are given as follows:

1. Every person possesses a right to engage in any lawful business or occupation and to enter, individually or collectively, into any lawful contract of employment, either as employer or employee. These rights are subject to limitation only through a valid exercise of public authority.

2. The right of open-shop operation, that is, the right of employer and employee to enter into and determine the conditions of employment relations with each other, is an essential part of the individual right of contract possessed by each of the parties.

3. All men possess the equal right to associate voluntarily for the accomplishment of lawful purposes by lawful means. The association of men, whether of employers, employees or others, for collective action or dealing, confers no authority over, and must not deny any right of, those who do not desire to act or deal with them.

4. The public welfare, the protection of the individual, and sound associations or combinations of employers or employees, or both, must equally be guards for his health and safety and legally responsible to others for their conduct and that of their agents.

5. To develop, with due regard for the health, safety and well-being of the individual, the required output of industry is the common social obligation of all engaged therein. The restriction of productive effort or of output by either employer or employee for the purpose of creating an artificial scarcity of the product or of labor is an injury to society.

6. The wage of labor must come out of the product of industry and must be earned and measured by its contribution thereto. In order that the worker, in his own and the general interest, may develop his full productive capacity, and may thereby earn at least a wage sufficient to sustain him upon a proper standard of living, it is the duty of management to co-operate with him to secure continuous employment suited to his abilities, to furnish incentive and opportunity for improvement, to provide proper safeguards for his health and safety and to encourage him in all practicable and reasonable ways to increase the value of his productive effort.

7. The number of hours in the work day or week in which the maximum output, consistent with the health and well-being of the individual, can be maintained in a given industry should be ascertained by careful study and never should be exceeded except in case of emergency, and one day of rest in seven, or its equivalent, should be provided. The reduction in working hours below such economic limit, in order to secure greater leisure for the individual, should be made only with full understanding and acceptance of the fact that it involves a commensurate loss in the earning power of the workers, a limitation and a shortage of the output of the industry and an increase in the cost of the product, with all the necessary effect of these things upon the interests of the community and the nation.

8. Adequate means satisfactory both to the employer and his employees, and voluntarily agreed to by them, should be provided for the discussion and adjustment of employment relations and the just and prompt settlement of all disputes that arise in the course of industrial operation.

9. When, in the establishment or adjustment of employment relations, the employer and his employees do not deal individually, but by mutual consent such dealing is conducted by either party through representatives, it is proper for the other party to ask that these representatives shall not be chosen or controlled by, or in such dealing in any degree represent, any outside group or interest in the questions at issue.

10. The greatest measure of reward and well-being for both employer and employee and the full social value of their service must be sought in the successful conduct and full development of the particular industrial establishment in which they are associated. Intelligent and practical co-operation based upon a mutual recognition of this community of interest constitutes the true basis of sound industrial relations.

11. The State is sovereign and cannot tolerate a divided allegiance on the part of its servants. While the right of government employees, national, state or municipal, to be heard and to secure consideration and just treatment must be amply safeguarded, the community welfare demands that no combination to prevent or impair the operation of government or of any government function shall be permitted.

12. In public-service activities the public interest and well-being must be paramount and controlling consideration. The power of regulation and protection exercised by the State over the corporation should properly extend to the employees insofar as may be necessary to assure the adequate, continuous and unimpaired operation of public-utility service.

Good Time to Purchase Burlap

An American contemporary publishes the following tip to upholsterers: Long-headed manufacturers will take advantage before it is too late of the tip which has gone out to purchase burlap now. From every indication the lowest point has been struck, and the tendency of the commodity from now on will be an upward one, the usual increase in demand which comes along about this season of the year being in part responsible. There seems to be no question but that burlap will be much higher in price in four or six weeks than it is at the present.

CHICAGO NEW YORK

THINNERS look very much alike in the can. But they act differently under the brush, or in the sprayer.

Some "set" too fast—others not fast enough. Brushmarks and bristles result from the first, pits and dustmarks from the second. Unless the dust conditions are unusually bad, it is generally agreed that better results are obtained with a thinner which does not evaporate too quickly.

We have tried hard to produce a satisfactory thinner. That we have done so, is vouched for by the rather large list of its consistent users.

Although LaTuque Turpentine evaporates smoothly and evenly in a reasonable length of time, it has great penetrating power—a decided advantage in some types of oil stains.

We invite requests for samples, for steady users generally result. Why not write us today?

La Tuque WOOD *Turpentine*

Fumed Oak Growing in Popularity

How This Effect is Secured—Stain and Fume-box Methods Described—Finishing Pollard Oak

By John N. Moore

There are fashions in furniture and fads in wood finishes. This fall the popular taste seems to be leaning toward the fumed oak finish. There are several methods of producing this finish. The advantages of fuming are that a more natural color is obtained than by staining, the wood is not made rough by operation, and there is also a great saving in labor.

There are materials on the market which will give the fumed oak effect without the expensive process of building or using the fuming cabinet. There are especially prepared fuming liquids offered, which equal in practicability every respect the effects obtained by the old fuming box method. It is a liquid which acts with the acids in the wood and produces on red and white oak that particularly beautiful brownish effect which has become so popular. These practical fuming liquids strike into the wood, but do not change the color in the pores. All high lights are retained in rich, dark shades.

New Fuming Stain

There is at least one material, called New Process Fuming Liquid, which has no disagreeable odor and is harmless. Nothing seems to affect the finish. You may even thoroughly sandpaper it without cutting through. A great variety of shades are procurable by varying the quantity of water or alcohol, either of which may be used in thinning. All that is necessary is to apply a thin coat, sandpaper and shellac, after which a finishing wax should be used for best results.

Back in forty-nine they came out west in prairie schooners,—now we have the twentieth-century limited. We used to do all our work with a quill pen,—now we have the typewriter, and even an adding, subtracting and dividing is done by machine. Just so, there are new methods in finishing furniture, and this New Process Fuming Liquid forms a quick, easy method which contributes to profit in the sale of the finished product. It also enables the furniture manufacturer to sell at a lower price.

Fume-box Method Popular

There are many, however, who are using the old fuming box in preparing the best grades of furniture. The best method perhaps, is to construct an air-tight chamber lined with wood, and the joints of the wood made air tight by pasting strips of paper over them. A chamber, say 9 x 4 x 6 is large enough for most purposes. Portable inter-frames may be made with shutters so that the sides of the chamber may be made smaller if necessary. Doors of these chambers should have glass panels to permit of the work being carefully watched. Article to be fumed should have all brass removed and then be placed in the chamber in such a position as to allow a free passage for the fumes to get to all parts of the wood. A half-dozen saucers should be placed on the floor at equal distances and pour into each 1/4 lb. spirits of ammonia —the strength of the ammonia should be about 880.

Wood will darken much quicker in hot weather than in cold, and if a very dark color is required it may be necessary to recharge the chamber after twenty-four hours. A good color for all practical purposes, however, is generally produced in about five hours. You will note that the wood will always become a little lighter after being taken from the fumigating chamber, consequently, work should be proceeded with as soon as taken out. If parts are too dark do not oil them—all other parts should be oiled at once and given a coat of wax. When dry sandpaper well with about No. 1 grade, and wax or French polish with the grain open as in the case of stained dark oak.

Special Box for Small Articles

Smaller articles may be fumed by simply making a much smaller air-tight compartment, and place a piece of felt on the level floor surface. Stand articles to be fumed on the felt and fill a saucer with about 1/4 lb. spirits of ammonia, then cover the whole box tightly and place weight on top to keep the fumes from escaping.

What is known as Pollard oak may best be treated by first oiling it and then applying a coat of polish, then rub down with No. 1 sand paper and wax and polish. Sometimes Pollard oak has large cracks on the surface, these must be filled and stained to match the wood. You see the ammonia does not touch the wood, but the fumes act on the tannic acid which the wood contains, and browns it so deeply that a shaving or two may be taken off without removing the color. The ammonia, therefore, you will note, has great penetrating power. The depth of the shade depends upon the quantity of ammonia used, the time the wood is exposed and the condition of the atmosphere, whether hot or cold. The wood will present no noticeable change until oiled or brought in contact with certain substances, such as shellac.

White and black ash, also chestnut, treated in the above manner, will also give a fair imitation of fumed oak. The material also should be hard wood with as open a grain as possible.

Variations of Fumed Finish

Another process producing a fumed oak effect is as follows: The work in hand should be sandpapered and the surface perfectly clean. Give the piece a priming coat of one part japan, one part raw linseed oil and one part rubbing varnish. Then add to a half gallon of this combination one pound of commercial cornstarch. To this add one pound good dry Turkish umber. When this combination is thoroughly mixed, apply a good flowing coat which acts as a sort of a primer. This should be allowed to stand until set and penetrated well into the grain of the wood. After this has been accomplished scrape off any surplus, crosswise of the grain, let the piece stand, and later wipe off with a rag. After this operation has been completed it will be found that the open grain has

absorbed the starch and umber, and these portions show a dark shade suggestive of age, while the rest of the surface is slightly darker. After the job has become thoroughly dry you can give a coat of rubbing varnish which is prepared by adding 1/2 lb. of starch to each gallon of varnish. This will completely fill the wood. After it is dry proceed to varnish, rub and finish the work in the usual manner. If you want to produce a natural oak finish follow the same method as outlined above, but omit the umber. This leaves the wood in the natural color.

Another method which produces an attractive fumed finish is effected by simply spreading on the surface of the work a concentrated solution of permanganate of potash, this being allowed to act until the desired shade is obtained. Five minutes is usually all that is necessary to give a good color. When action is terminated the wood should be carefully washed with water, dried and waxed, or polished.

You will find in the above several methods, but we would recommend the use of either the old-time fuming box system or some of the fuming liquids which are supplied by the better known paint and varnish manufacturers.

Securing Satisfactory Results With Walnut

Many Different Shades Produced—Formulas for Water Stains—Suggestions for Standardized Finish—Touching Up Sap Streaks

By W. W. Wilman

When looking at the walnut furniture offered for sale at the different retail stores, one is confronted by a wide range of shades and finishes, varying from a light brown to almost a black shade. Some of these finishes are attractive but in some respects it is unfortunate that some effort has not been made to work out a standard shade for this beautiful wood.

In the opinion of the writer a nice rich brown makes the most attractive finish for walnut. Some of the darker finishes give a pleasing effect but tend to obscure the grain. A finish to fulfill its real purpose should bring out and emphasize the beauties of the grain of the wood to which it is applied. This cannot be done by applying a very dark stain and filler. Some pleasing effects are secured through some of the lighter shades, the slightest of these usually being secured by bleaching the wood, but for general all-around attractiveness it is hard to surpass a rich brown shade.

How Walnut is Finished

The method in vogue in many of our woodworking plants is to first apply a coat of suitable walnut stain, usually by brushing, then a wash coat of thin shellac, to fix the grain that has been raised by the water stain. The surface is then sanded and filled. After filling a coat of shellac or lacquer of some kind and two or three coats of varnish are applied. Each coat of varnish and shellac is well sanded before the next one is applied.

There are many different formulas for walnut stain and it is not so much a question of the stain that is used as the result that is secured. One of the stains in common use is made up as follows: Walnut crystals 12 ozs., carbonate of soda (dried) ½ oz., and water 1 gal. Use hot water in mixing this solution and strain or draw off the clear liquid. If this stain is to be used on soft wood, it will probably be found advisable to vary it as follows: Walnut crystals 10 ozs., bicromate of potash ¼ oz., and water 1 gal. A stain for softwood should have a good penetrating power.

Suggestion for Standard Shade.

A well-known American authority on finishing has worked out a formula for a stain which he suggests might be adopted as standard for walnut. It is, loutre 1 oz., mahogany brown ½ oz., yellow 9803 1 oz., sulphur brown 12 ozs., lye ½ oz., and water 6½ gallons. In this stain the yellow is used to kill the blue that is so often encountered in walnut, specially on veneered work. The loutre is well known to finishers, being dark brown in color. Mahogany brown is about the same shade but must not be confused with brown mahogany, which is a mixed mahogany stain. The sulphur brown is much the same shade as walnut crystals so that simplifies the mixing of a stain to where a suitable shade of brown and a suitable shade of yellow, when mixed in certain proportions will give the desired result.

A good filler may be made from powdered silex as described elsewhere in this issue. It should be colored as near the shade of the wood as possible, taking care not to make it too light. Van Dyke brown is a good color for mixing with the filler. Sometimes the work will be found to be too light after being filled. When that occurs, another coat of the stain will correct the shade.

Each Coat Must Be Watched.

The subsequent coats of shellac and varnish may vary the shade, so that even though the correct color was obtained in the filling and staining the finished shade may be off slightly. This may be corrected by carefully choosing the varnish and shellac and perhaps mixing light and dark material to secure a proper effect.

In the finishing of walnut, sap streaks are often encountered and at times give considerable trouble. There are many different methods employed in overcoming these streaks from applying a thin glue size, to the use of a solution of ordinary common salt. Some advocate the use of a thinner or lighter stain on the streaks, but that is not entirely satisfactory owing to the difficulty experienced in working two stains on the one surface. It is an operation requiring considerable skill, as it is hard to blend two stains on one surface so that difference in shade and overlapping will not be noticeable.

A simpler way is to moisten the sap streak just before staining and then work the regular stain out lightly over the streaked portion with a damp brush. The success of the whole operation depends largely on the skill and experience of the finisher. A little experimenting along this line will soon develop good judgment and skill.

The white lead in the keg should be covered with water, but the water should be changed occasionally, as rust occurs in the sheet-iron containers now used. Zinc white should not be covered with water, which hardens it, but with oil.

Demand is for High Class Finish

Important Points to Consider—Application of Stains and Filler—Spray Machine Efficient Tool—Poor Machining Reponsible

By D. Johnson

The readers who have been in the furniture manufacturing business for twenty, thirty or forty years will remember the old time ways of constructing and finishing furniture. You remember the old time finishing room foreman who would mix his stains by the rule of thumb method, a little of this, a little of that and a little of the other. If the combination did not make the shade of stain desired, another batch would be made and hours of valuable time as well as expensive material wasted. It is to be regretted that one will to this day find many finishing rooms of the type mentioned. However, it cannot be denied that considerable progress toward improved methods of finishing has been made during the time mentioned in our successful and progressive furniture factories.

The quality of finishing demanded by the buying public today should prove to every furniture manufacturer the importance of "perfect finish." Of course, in order to apply a perfect finish the finishing room must be modern, the material used the very best that money can buy and the wood on which the finish is applied absolutely dry.

Conditions Have Changed Considerably.

I cannot understand why some manufacturers will buy any and every modern wood-working machine that will cut the cost of their production, have modern factories, efficient cost systems and good mechanics to manufacture their furniture but they very much neglect one of the most important processes of furniture making, i.e., the dry kiln and the proper condition of the lumber before it is cut up for the purpose of making furniture. Those of you who have had actual experience in manufacturing furniture or pianos all know what green or partly dried lumber will do in the way of a joint. Imagine therefore what will happen to wood exposed to a temperature in the varnish drying room of 120 degrees Fahrenheit. Some of you wonder why your pieces check after varnished; why joints do not hold up, and you may have claimed that the wood is fairly possessed. You declare that the varnish drying system you are using is no good and, as I know some of you have wone, decide to do without it. This does not, however, solve your problem.

When your and my grandfather were boys, houses were not heated with furnaces, water heating systems or steam plants. The good old mother had a small stove in the kitchen and when company came on a Sunday the best room would be heated. Today nearly all houses are heated to from 70 to 85 or 90 degrees, so you can imagine how partly dried wood is going to stand up under those conditions. The importance of this should be appreciated by every furniture manufacturer, regardless of the size of his plant.

Suggestions for the Finshing Room.

One will find many original kinks in finishing rooms for the purpose of reducing the cost of labor. One of these is to apply water stain with a sponge instead of a brush. There is no doubt that stain can be applied by this method more quickly than with a brush. However, is it not a fact that the quality of the finish is likely to suffer? Do a little experimenting. Stain a pretty fair-sized board with a polar bear hair brush. Stain another board with a sponge. You will find the sponge-stained board to be streaky. Not so, however the one stained with the brush. Of course, if you manufacture very, very cheap furniture where low price is the object, and you can get away with sponge-stained work, that is up to you. Why not dip your furniture?

Where water stains are applied a sufficient amount of time should be allowed for drying. We know that water stain expands the fibre of the wood. This proves that all moisture must be thrown off and the pores resume their natural condition. Unless this is done, the shrinkage will continue long after the goods are finished.

Sanding Requires Consideration.

It is to be regretted that so little attention is given to the sanding of the wood before it is finished. Of course, modern sanding machines have been installed in most up-to-date plants, but sometimes work will need a little touching-up. Again, this sanding must be done with, not against the grain. Some of the woods used in furniture making are hard to sand. In some woods the structure is tough, hard and pithy. In others, short and stock fibres. Attention must be directed to the planer and sander. A few minutes' time spent frequently in sharpening planer knives is a good investment. Again, if you expect good work from your sander you must keep it properly adjusted. Care in handling the work and doing it properly will save your finishing department an enormous amount of work as well as unnecessary annoyance and expense.

As to fillers, some finishers have the mistaken idea the thicker the filler the better. Of course, thick filler may be necessary on very coarse woods, but there is such a thing as being too thick. Every expert finisher will tell you that two thin coats are better than one thick coat of filler. The wood should be filled completely so that it will not be easily affected by moisture or any atmospheric influences.

Equipment for Preparing Water Stain.

As to the water stain solution, we know that all solvents are more effective when heated. So many finishers make the mistake of dissolving stains in cold water. In most finishing rooms they have no equipment at all, so to speak, to prepare stains. Water as well as oil stains should be dissolved over a hot water bath. Your stain material must be in a state of solution, free from suspended matter. By all means stir your stains before using. Where oil stains are used, liberal quantities of such solvents as benzole, acetone, wood alcohol, etc., should be carried in stock.

Sprayers for applying varnish are now found in nearly every modern finishing room. The use of the sprayer, as every manufacturer will tell you who has used them in his finishing rooms, is without question economical. Some may argue that the sprayer wastes varnish, this may or may not be true, depending upon the class of work varnished. But one thing I believe

is certain, and that is that the amount of material wasted does not anywhere near amount to the saving in labor cost. This is especially true on irregular work. A charge against brush work is: Too much brushing out impairs the lustre of the finish coat. Again, some varnishers do not exercise care in keeping brushes and pots clean and as a result the job to which the varnish coming from such cans or applied with such brushes is compelled to suffer.

Allow sufficient time between coats for drying. We have stated in former articles that so many finishers seem to suppose that the last two coats should dry a long time and they will frequently apply the first two coats within ten or twenty-four hours. Every coat must be hard before the next one is applied.—American Furniture Manufacturer.

Canadian Paint and Varnish Industry

According to figures recently issued by the Dominion Bureau of Statistics, for the year 1918, the paints and varnishes manufactured in Canada during that period had a value of $17,678,049, while the raw materials used totalled $9,203,530. With regard to varnish the production increased from 1,577,009 gallons in 1917 to 3,317,069 gallons in 1918, with a selling value of $3,764,555.

Satisfactory statistics relating to the prices asked for paints and varnishes are only objectionable by reference to the trade journals, in which quotations are given for the many grades. Cheap rosin furniture varnishes sold at about $1.10 a gallon in October, 1918, while the finest long oil spar varnishes commanded prices ranging up to $5 a gallon. Mixed paints at that time averaged about $4 on one-gallon can basis.

Products of Industry.

Kind.	Quantity.	Value.
Linseed oil, boiled and refined (sold), gals.	$ 113,256	$ 211,336
Paints in oil (ready for use), gals.	7,483,893	8,613,973
Paste paints, lbs.	33,500	3,460
Colors, in oil and Japan, lbs.	27,800	5,142
Varnishes, all kinds, gals.	3,317,069	3,764,555
Japans and lacquers, gals.	209,249	251,856
Shellac, gals.	81,704	309,975
Stains, gals.	216,274	275,665
Dryers, gals.	105,868	105.401
White lead, dry, lbs.	4,030,367	473,922
White lead, in oil, lbs.	11,874,260	1,545,918
Lampblack and other carbon, black, lbs.	62,939	6,878
Oxides of lead (litharge, red lead, etc., lbs.	2,432,936	268,624
Iron oxides, lbs.	748,750	44,925
Dry colors, lbs.	335,000	404,770
All other pigments, lbs.	3,535,813	404,770
Barytes, lbs.	1,236,000	12,400
Putty and other fillers, lbs.	5,178,405	280,581
Asphaltic, pitch and tar products, lbs.		38,463
All other miscellaneous products, lbs.		982,280

Amount of Exports.

Exports from Canada of paints, varnishes and materials used in the paint and varnish industry, are given in detail below:

Articles exported.	Quantity.	Value.
Cobalt oxide and Cobalt salts, lbs.	588,229	$ 853,737
Mineral pigments, iron oxides, ochres, cwt.	15,389	18,377
Paints and varnishes of all kinds		1,239,999
Total value		$2,122,113

A survey of this industry covering the year 1919 is now in course of compilation. It is anticipated that the figures for 1919 will show a very satisfactory improvement of those given above.

Safety is sound sense and good business, says the Safety League.

Speed and System in Staining

"Know the stain you are using" is a word of advice which every finisher should heed. Different stains have different characteristics, and the best results can be obtained only when the finisher adapts himself to the requirements of the stain he is using.

Speed is essential in applying stains, whether oil, acid, spirit, or water stain; otherwise a uniform depth of color cannot be expected throughout the surface. On veneer work, unless the surface is covered in the least possible time, the brush may work up the glue that has been squeezed through to the outer edge of the pores.

Staining should be done systematically. By staining the unimportant parts first, such as the back, bottom and inside first, any stain that runs over an edge and gets on the important parts while they are yet in the white, will be lifted and worked out when the regular coat is applied. If the prominent parts were stained first, stain which might get on them would be liable to show up after the goods were varnished.

Have a place to begin staining and a place to finish staining. To illustrate, take a side board. As most finishers work to the right, the place to start is at the top of the left hand gable. As you stain the gable, also stain the edge of the top, wiping it off immediately to prevent it from becoming daubed and spotted. The edge and inside of the pilaster should be stained next, then the front edge of the top, wiping it off immediately and proceeding downward to the drawers and drawer divisions, up the truss and pilaster on the other side, around to, and down the right hand on the edges of the top which have already been stained and wiped off to give them the same depth of color as the case.

While we have taken sideboards for the sake of illustration, there is a logical sequence in which the parts of every other article of furniture should be stained. This order can be determined by a little study. The best method is to stain first the parts on which there is the least chance of stain running down from other parts. It is also obvious that the unimportant parts which do not show should be stained first, because if any surplus stain from other parts runs on them, it will not matter. By determining the quickest and best way of handling every article of furniture to be finished, better results will be obtained and more work accomplished.—"Finishing Facts."

Gasoline Fumes High Explosive

A man is quite interested in building before he takes the trouble to have an estimate figured and in the great majority of cases he is a "live" prospect. This being the case, are we not falling down on our salesmanship when we are unable to close with nearly half of our customers? We would like to know the exact reason why we failed to sell every estimate that was cancelled. This information would enable us to find the weak spot in our selling methods. We have sent out a letter to a number of our yards asking for full information on these estimates that were cancelled. If you received these, we hope you will take great care to answer them as fully as possible. If you are in doubt about any of them, ask the man for whom you figured the estimate, just why he did not go ahead with the building, and report the facts to us.

A very fast-running spindle needs a light and pliable belt.

THE PRICE OUTLOOK

In Paint and Wood-Finishing Materials

MARIETTA WOOD FINISH SPECIALISTS

Linseed oil is not as high as it was. Some people think this should mean an immediate drop in prices of paints and wood finishing materials. It is only necessary to look at the facts to see that there is no ground for such a conclusion.

How Linseed Oil Affects Paint Cost

Paint is two-thirds pigment and one-third vehicle. This one-third is made up partly of linseed oil and partly of the necessary dryers. So that less than one-third, even of the highest grade paint, is linseed oil.

The other two-thirds consist of pigments and coloring materials. These were never known to be so high.

Lead never was so high and there is talk of another advance. There is not enough available to supply the demand, at any price.

Dry colors are scarce and advancing.

Turpentine is 300% higher than during the war.

Stains and Fillers

When it comes to stains and fillers, such materials as benzol, toluol, alcohol, dyes, etc., are abnormally high with no reason to expect a downward movement.

As to wood filler, it takes a twenty-five cent drop in linseed oil to justify a quarter of a cent drop in filler with other things normal, which they are not.

Containers are higher than ever and harder to get. Packing cases ditto, with prices advancing.

Labor—well, you know about that.

Freight Advance Gets Us Going and Coming

Then there's transportation. The rate increase recently allowed by the government gets manufacturers going and coming. They must pay it once on their raw materials and again to get their finished products to the consumer. To say nothing of the increased cost of traveling men to visit the trade.

Order Early to Get Service

There is no reason whatever to put off buying at present prices, and with present day embargoes on shipments, the earlier you can order, the better your chances of service.

So far as we are concerned, we shall welcome the first opportunity to reduce our prices if it can be done on the logical basis of lower costs of production and distribution.

How Filler Should be Handled and Applied

Trouble Encountered from Light Pores—What Makes Best Fillers—Should Work Easily and Freely—Advantage of Shellac Wash

By Harold Sutton

In applying filler to a wood it is usually desirable to have the pores show as dark, if not darker, than the wood itself when the article is finished. Sometimes, seemingly in spite of careful, painstaking work, the pores show up light and many finishers are at a loss to account for this fault, as they do not see where they slipped-up.

This trouble is not peculiar to any one wood, but is as likely to occur when finishing oak as when finishing mahogany, so that the suggestion made in this article may be applied in a broad way to all woods.

A finisher recently stated that the pores in some mahogany pieces he had just finished were showing up light and after the pieces were finished. He said he had proceeded in the usual manner, viz., stain, wash shellac, filler, shellac, varnish, etc., and did not quite see why, in this particular instance, he should be troubled with light pores. An examination of the finishing material showed that the stain used was just a trifle darker than the filler which was applied. It was a newly-mixed lot of stain and the slight difference in shade between it and the filler escaped notice. One would naturally think that this trouble would have been remedied readily, as anyone should know that a light filler would result in light pores.

Should Be Shade Darker

It is advisable to use a filler that is darker than the stain. When this is done, there need be little or no worry on the score of light pores. There is another reason why the filler should be made darker than the stain and that is as the oil is evaporated or absorbed into the wood, the filler turns lighter, thus though in the first instance it might have been the same shade as the stain, when thoroughly dry it is likely to show up a trifle lighter. This is more noticeable when a wash coat of shellac is not used on top of the stain. The shellac has a tendency to seal the walls of the pores and thus prevent the oil of the filler being absorbed into the wood. In this way the filler is preserved so that when dry it retains its original color. If the filler is to be used on a surface that has been stained but not given a coat of wash shellac, a slightly larger proportion of oil should be used. This extra oil will take care of a certain amount of absorption and evaporation.

Another important item to watch when using filler is to see that the material is kept well stirred. If this is not done, the first of the filler used will contain too much oil and the latter part too little. This often accounts for the grey, cloudy effect sometimes noticed on mahogany. The heavy material in the bottom of the can was too thick and did not contain sufficient oil. A filler should be so prepared that it will harmonize in color with the general scheme of finish.

When Filler is Too Thin

Every finisher knows that the filler should be rubbed across the grain. If this is not done, the material is worked out of, instead of into, the pores. If it settles into the pores, as it dries, leaving a slight depression, it usually indicates that the filler was too thin. On the other hand, if it lifts out when being rubbed off, it means that the filler lacked sufficient binding. The addition of some japan, say, a pint of japan to a gallon of filler, should stop this lifting out.

It might not be out of place to make a few remarks regarding the ingredients of a good filler. While certain vegetable compounds, such as starch or flour, are often used for this purpose, the best filler is that which is made from some substance which does not shrink or swell, will not absorb any of the vehicle used to bind and thin, should be impervious to moisture and water, and should not be affected by changes in temperature. Another very desirable quality is weight. The filler should be heavy enough to settle into the pores of the wood and heavy enough that it will not carry any air into the pores. These desirable features are found to a greater extent in powdered silex than in any other material. Whiting, china clay, resins and lime are commonly used, but it is extremely doubtful if a filler compounded from any one of these ingredients, can compare with that made of silex.

Mixing Filler From Silex

In making a filler from silex, the material is usually stirred into a mixture of boiled oil and turpentine (mineral turps may be used) until a homogenous mass, of the consistency of heavy paint, is formed. The color, which is preferably ground in oil, is thinned down so that it will pour readily and then thoroughly stirred into the paste. This may then be thinned with naphtha to the desired consistency.

Filler should be thinned so that it will work easily when applied. Some maintain that it should not work easily, but a filler cannot do this work satisfactorily unless it does work easily. If it is too thick and stiff, it will work or roll out of the pores while being rubbed off. When properly mixed, it will clean off easily, and cut clean, leaving smooth, level pores. A good filler may be cleaned easily between thirty minutes and three hours after it is applied, should dry in twenty-four hours and harden thoroughly in forty-eight hours.

If you should have trouble in staining yellow pine with a water stain, the wood not staining evenly, take a rag or sponge and damp it with water and rub those parts that do not take the stain well. A little denatured alcohol in the stain will help it to penetrate better.

When priming wood, use the paint liberally and rub it well into the wood, especially the sappy places, where the paint naturally sinks in. Better touch up such places, when the priming coat is dry, with paint or shellac. This will give a more uniform or solid surface.

In preparing a lead and zinc paint, mix the two pigments separately, after which mix well together, adding the zinc to the white lead slowly, and stirring well. The lead being heavier than the zinc, the tendency is for the lead to separate from the zinc; hence the paint must be mixed in the pot now and then.

"ENAMELS"

Our business in both White and Old Ivory Enamels and Primers has trebled during the past year.

WHY?

They are the best on the market. If you are not using them, write for samples and prices.

Mr. Paul Weaver sanding one of the corners of a heavy hard wood picture frame. Eight hundred corners like this each week!

Too Good is Good Enough!

Kafka, Speed-grits salesman, was worried.

This was the fourth time he had called on his good customer Paul Weaver, of the Weaver Art Shop, Allentown, Pa., makers of fine picture frames. And this was the fourth time he had received the cool and distant message "Mr. Weaver doesn't need any more Speed-grits discs."

"Something wrong," thought Kafka. "I'll camp on this job until I get the answer straight from Weaver."

An hour passed. Two hours. Then—in from the shop sauntered Mr. Weaver. "Hello Kafka, still here? What's up?" "Just what I want to know," queried the salesman. "What's wrong with our goods? Why don't I get any more orders?" "Wrong?" said Weaver, "Wrong? Come out here—"

"See that disc?" Weaver pointed to a Manning Speed-grits Garnet Combination Disc which was whirring busily. "Six weeks service from that fellow and it's still good. I make more than a hundred frames a week from moulding running from ½ inch to 4 inches in width—some hardwood, some soft, some composition harder than any wood. Each frame has eight corners that must be sanded. That's 800 pieces a week and yet I run one Speed-grits disc six weeks without a change. Reason enough why you aren't getting orders. Speed-grits is too good."

Manning Speed-grits

Look for this trade-mark on the back of every belt, sheet or disc.

Note:—The Speed-grits Garnet Combination disc mentioned lasted eight weeks and sanded approximately 6,400 pieces of this difficult work.

Good workmen know the difference.

The above photograph shows the Nichols Equipment installed in the works of the Votey Organ Company, Garwood, N.J. These dryers may be used to turn out automobile bodies, furniture, pianos, talking machines, etc., in as many days as it formerly took weeks, and the finish is better, for it is dried scientifically, from the inside out.

If not already Nichols equipped, you owe it to yourself at least to investigate, because:—

1—It will easily triple the output of your finishing rooms.

2—It will decrease congestion in your factory.

3—It will decrease the investment in goods necessarily in process.

4—It will enable you to make more prompt deliveries.

We will analyze your particular conditions and then make you a proposition on an equipment that we know, from our extended experience, will save you time and money, as well as improve your product.

We guarantee fully the efficiency of the equipment as well as its mechanical construction. Every installation has been successful. There are hundreds of concerns to whom we can refer you.

A. S. NICHOLS COMPANY, 33 W. 42nd St. NEW YORK CITY

Manufacturers of Dryers for Lumber, Veneers, Glued Stock, Varnish, Paint and Enamels, for both high and low temperature work. Also sole agents for "Zenitherm" insulating material for the making of rooms for both high and low temperature drying.

Aeron Finishing System (Surpasses Brushing) Certainty
of Utmost Finishing Room Results

The years of result-getting, satisfactory service that the Aeron spray-finishing system has been rendering the wood- and metal-working industries, gives to each new installation of this equipment an assurance of the utmost in quality, speed and economy.

No matter what type, size or grade of product you manufacture, nor with what kind of finishing material you coat it—the Aeron System undoubtedly is now being used on work of the same or a similar character, and will be most certain to make it possible for you to do the highest grade of work at a big reduction in costs.

Operation Facts One Aeron operator easily does the work of 2 to 5 or more hand brushers--this is governed by nature of work.
A cleaner and more uniform coating of every material is applied—there are no brush marks, thin spots or fatty edges.
Work is made absolutely healthful and safe—all fumes are completely removed.
Equipment is kept in the best working condition at practically no cost.
The Aeron System is sold on a strictly guaranteed basis, and every installation followed up by a competent service organization.

Write and let us send on more definite particulars.

Veneers and Panels

Can Warping of Panels be Prevented?

Equalization of Strains Cause of Warping—Elimination or Absorption of Moisture Starts Movement—How Warping May be Overcome

By S. H. Johnstone

One of the most persistent troubles encountered in the manufacture of veneered products is warping and twisting. This is especially true where thin ply wood panels are being produced. Before an intelligent attempt can be made to prevent warping, one must have a clear idea of what causes wood to move and twist or particularly what causes built up stock to exhibit such a strong tendency to buckle and give trouble.

Warping, cupping, twisting and other similar troubles are caused by unequal strains and stresses in the wood itsef. These forces tend to release or equalize themselves, with the result that the piece warps or moves in one way or another. These stresses are set up or released, primarily, through the absorption or elimination of moisture, so that moisture may be taken as the prime cause of all warping or twisting.

Latent Stress in Flat Panel

Take the case of a panel that has been held true and flat until it is thoroughly dry. Someone might say that certain parts of that panel are under tension and yet it stays perfectly straight. Subject that piece to a change in atmospheric conditions so that moisture will either be absorbed or eliminated and see what happens. When the piece was dried flat the fibres became set in that shape and consequently did not move. As long as conditions did not change they were able to resist all internal strains, but as soon as the slightest movement took place certain tensions were released that would result in bucking.

The reason why warping takes pace when any strains or stresses are set up or released is that the different forces which exist in the piece of wood or panel tend or strive to reach a state of stabilization or equalization. That is, the stronger forces act on the weaker parts until an average pull is attained. Naturally the piece is pulled and twisted until these forces reach a state of equilibrium. The solution of the trouble would be to build a panel that would be flat when all strains are equalized or stabilized. If this were possible such a piece of plywood might start out warped and buckled and straighten itself as the moisture was removed.

Texture and Strength of Plies

This is why so many veneer men pay so much attention to the texture and general characteristics of the stock they lay on either side of a core. If two pieces of oak of even texture and strength are glued on either side of a piece of thin core, it is logical to assume that the strain or pull would be about equal on each side. That is provided ordinary care was exercised in the laying and drying operations. Take another panel and glue on two pieces of oak, but put them on so that the grains on either side do not run exactly parallel. Now what happens? While the strain on each face may be equal the two pieces are not pulling in the same direction. Therefore the pull of one side does not counteract that of the other so naturally, warping and twisting will result.

Two preventative measures that will suggest themselves are to use materials, on opposite sides, that are practically the same in texture and strength and to see that the grain of opposing layers are running parallel to each other. These remedies may seem simple, yet a large percentage of warped panels may be traced directly to the fact that one or both of the above suggestions has been overloked or neglected.

Different Woods May be Used

In selecting stock to be applied to opposite sides of a panel it is not absolutely necessary that the same wood be selected. The strength and texture of the material is the important factor. The accompanying table shows the relative strength of the ordinary commercial woods. By using wood of different species, but of the same relative strength, on opposing sides of a panel, satisfactory results should be secured. Thus Douglas fir could be employed for the back of a panel having oak on the face or white ash and black walnut could be used. Emphasis should be placed on the strength of the wood applied to each face rather than on using the same wood. Two pieces of oak might vary in density and strength and if used in opposition to each other would likely cause trouble. It is the comparative strength and density that counts.

Relative Strength of Woods

Birch is used as a standard and given a value of 100.

Wood	Strength	Wood	Strength
Yellow birch	100	Cotton gum	85
Basswood	58	Red oak	90
Cottonwood	62	Douglas fir	91
White pine	62	Cherry	93
Yellow poplar	65	Beech	94
Chestnut	65	White oak	97
Red spruce	66	Longleaf pine	101
Sycamore	76	Sugar maple	106
Hemlock	70	White ash	106
White elm	80	Black walnut	110
Red gum	80	Cork elm	110
Black gum	81	Shelbark hickory	120
Cypress	80	Black locust	160

Symmetrical Construction Desirable

Much is heard of the symmetrical construction of panels so as to secure an even balance. This is usually secured by using an odd number of plies. Not only that, but these plies should be arranged so that the grain of any two opposing plies should be parallel. This is a point to which little attention is given, yet it is a most important one.

Numerous experiments have been made to determine the result of not keeping the grain of two cor-

responding layers parallel. It was found that a deviation from the parallel as small as five degrees may account for considerable twisting. A test panel was glued up in which the grain of each face ran at 45 degrees to the core and at 90 degrees to each other. The resultant panel twisted so badly that two of the corners nearly came together. This demonstrated, beyond the shadow of a doubt, the necessity for building plywood as symmetrically as possible.

Next month, if permitted, the writer will cover another phase of the warping question, dealing with the core, application of glue and the drying of panels.

Are Western Woods Suitable for Cores?

Choice of Core Stock Important Question—Character of Wood and Percentage of Clear Cutting—Result of Experiments with Western Species

By Philip Coye

In discussing the high prices being asked for the woods most suitable for core work, a writer in the "Furniture Manufacturer & Artisan" has this to say:

The prevailing high prices of woods commonly used for core stock, together with the fact that they are becoming scarcer, emphasizes the necessity of securing suitable substitutes. At the present time, three possible solutions of this problem present themselves: First, the use of some material other than wood, and, of course, less expensive. Second, the use of other and cheaper species than are now being used, and third, the use of other species which although their first cost is about the same, will give clearer cuttings per M feet.

As but one substitute other than wood has been brought to public attention, — a wooden wallboard which has not demonstrated its suitability to any great extent, we can pass over this possibility without further comment. The second suggestion is practically worthless, as there is no lumber now on the market cheaper than the species being used, which will furnish satisfactory cuttings for core stock. The third suggestion seems to embody the only logical means of relieving the situation.

Comparative Ratio of Shrinkage.

Eastern Hardwoods.

	Shrinkage from green to oven dry		Specific gravity based on oven dry volume
	Radial	Tangential	
Chestnut	3.4	6.7	.46
Gum	5.2	9.9	.53
Poplar	4.1	6.9	.42
Basswood	6.6	9.3	.40
Maple	4.8	9.2	.66
Birch	7.4	9.0	.66
Average for all eastern hardwoods	5.2	8.5	.52
Total average shrinkage, both radial and tangential		13.7	

Western Conifers.

Western hemlock	4.5	7.9	.43
Douglas fir	5.0	7.9	.52
White fir	3.4	7.0	44
Redwood	2.7	4.2	.43
Sitka spruce	4.5	7.4	.37
Western yellow pine	3.9	6.4	.42
Average for all western conifers	4.0	6.8	.44
Total average shrinkage, both radial and tangential		10.8	

There are several woods growing in abundance in the west, which meet the requirements of panel core stock. They are in the main low density woods having a low ratio of expansion and contraction. A study of the accompanying table, which is taken from the United States Forest Service Bulletin No. 556, forms a basis of comparison between eastern hardwoods and western conifers. The table demonstrates an average specific gravity based on oven-dry volume and a shrinkage from green to oven-dry ways of commonly-used eastern hardwoods and of several western species of conifers.

Some experiments as to the suitability of western woods for panel core stock were conducted recently by the writer. The following species were prepared for cores,—13/16" by 12 x 12 and contained an average moisture content of about 9% when glued. Western hemlock, Douglas fir, white fir, redwood, sitka spruce and western yellow pine. Panels were made in three and five plies, using largely 1/20 yellow poplar for crossbanding and 1/20 birch for face stock. A common casing glue was used, as some of the tests were made in moist air conditions, and it was desirable that there be no open glue joints from that cause. After glueing and being allowed to stand twenty-four hours in the retaining clamps, the panels were dried in a Tieman kiln under the following conditions: Temperatpre 120 degrees F., humidity 46%.

Satisfactory Results Secured.

After twenty-four hours under these conditions, the panels were removed, tested for moisture contents and examined for defects. There seemed to be no warping checks or other faults present, and all the joints were tight; in fact, each panel was in excellent condition and has remained so under ordinary atmospheric conditions. The cost of most of the conifers, delivered in Chicago, is at the present not any lower than that of eastern hardwoods. However, a 66% clear cut is all that can be obtained from a No. 1 common grade, and 50% from a No. 2 common of the latter woods, while, according to the best advices No. 1 common, Douglas fir, will cut 95% clear and No. 2 common between 60% and 70%.

From the standpoint of efficiency, there seems to be no reason why the western woods cannot be used for panel cores. They glue well, dry easily and have a low density and shinkage ratio. What remains to be done is for the eastern manufacturers to do a little experimenting and satisfy themselves as to the economy and suitability of western woods for panel work.

Data on Design of Plywood for Aircraft

This report gives the results of investigations made by the Forest Products Laboratory of the U. S. Forest Service at Madison, Wisconsin, for the War and Navy Departments. Sufficient discussion on the mechanical and physical properties of plywood is included so that the data may be intelligently used. The data, although primarily intended for aircraft design, have a broader field of application. A copy of Report No. 84 may be obtained from the National Advisory Committee for Aeronautics, Washington, D.C., upon request.

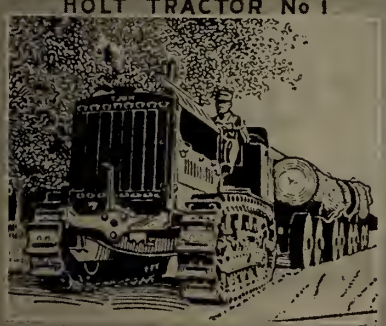
HOLT TRACTOR No 1



HOLT TRACTOR No 2

A half century ago this company was founded on its present site. Today the popular idea is that Indiana and Ohio are devoid of timber. The extensive logging equipment here pictured is but the mechanical end of our logging department, all operating within a radius of 100 miles of our Indiana mills, and hauling northern grown Oak, Walnut, Ash, and other high-grade logs to the railroad. These machines with a full complement of trailers and animals will be so occupied for years.

Since its inception, the company has never been out of the family, and therein lies it strength. An intimate knowledge of all supplies of virgin growth northern timber makes possible an unceasing flow of as good logs as we cut fifty years ago.

Efficiency in manufacture has become traditional in our organization. The genuine and the perfect in northern grown hardwoods are our pride.

SUPPLYING HIGH GRADE

Veneered Panels

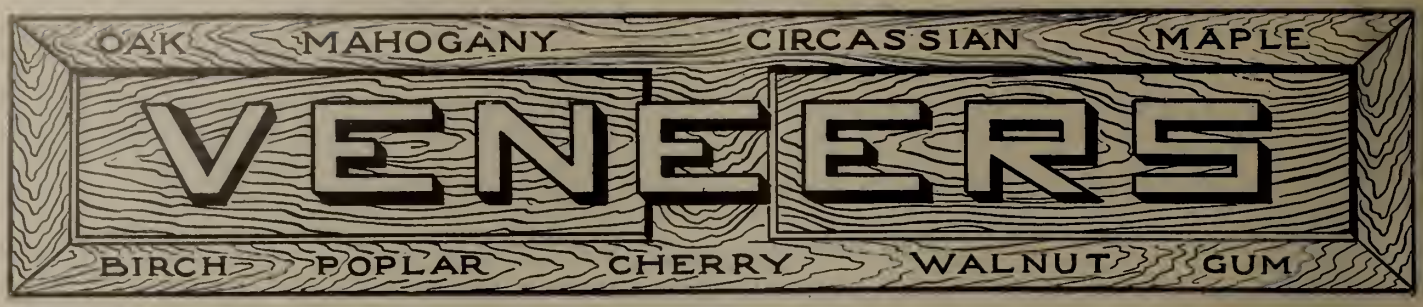
IN ANY SIZE, THICKNESS
OR KIND OF WOOD

Immediate Shipment on all Stock Sizes in Walnut, Plain Oak, Birch, Mahogony, Etc.

Buyers of Veneers and Panels

will find it to their advantage to purchase from the manufacturers and dealers whose advertisements appear in this publication. They are progressive firms—the leaders in the business, which is a guarantee of good service and prompt attention to orders.

Give your business to the man who will spend his time and money to get in touch with you. He deserves it—if his stock and prices are right.



INVESTIGATE

P.-J. SERVICE

For high-grade rotary cut veneer, that is smooth and evenly cut and dried by mechanical means to any percentage of moisture desired.

We also operate large band mills where all kinds of southern hardwood lumber is cut from our own tract of timber in the very heart of the Saint Francis Basin District, Arkansas.

PENROD-JURDEN COMPANY

A Name that Should be on your Enquiry List for both Veneer and Lumber

Mills at Helena and Penjur, Ark. General Offices: Memphis, Tennessee.

Penrod Walnut and Veneer Co.

Kansas City, - Mo.

Exclusive Manufacturers American Walnut Lumber and Veneers

ON account of the freight congestion and the possibility of a very serious car shortage, we suggest you anticipate your Walnut requirements and get in your supply for the next few months as soon as possible.

Write us for prices on Lumber and Veneers. *"PENROD SERVICE" Satisfies.*

Geo. C. Hall, 610 South Michigan Street, Representative for Chicago and Michigan territory.

W. M. Ritter on Lumber Situation

Mr. W. M. Ritter, of the W. M. Ritter Lumber Co., Columbus, Ohio, accompanied by Mr. F. B. Pryor, his sales manager, spent a few days in Toronto recently on business. Mr. Ritter is one of the best known hardwood lumber manufacturers in the United States, and this was his first visit to Canada. He served during the war on the War Industries Board at Washington and rendered valuable service. His company operate thirteen band mills, six planing mills and eleven flooring units, and the annual capacity is 130,000,000 feet. About 1,000,000 logs each year are cut into hardwood at the various sawmills of his company.

Speaking of the general business situation in the United States, he stated that not only in lumber but in all other commodities values had gone too high, and there was bound to be a halt in the ascension. The inflation of prices could not go on forever without some set-back Such a condition of affairs was not a healthy one and the great danger was that when a recession set in it would, no doubt, swing too far the other way.

A little over a year ago Mr. Ritter, in conference with several lumbermen and other representatives of building materials, sought to check the constant inflation of quotations, not only in lumber but in glass, hardware, cement and other lines. At that time the demand was very keen and the interests affected seemed to believe that there was little or no danger of a turning of the tide. This had now come and the peak had been reached.

"I am, continued Mr. Ritter, "strongly in favor of stabilization of prices. I would not like to see them go back to the pre-war levels for many reasons. One is that our American dollar to-day has only about 50 per cent. of the purchasing power that it had before the war, and we have a heavy war debt to meet. If too low values are established it will take too many years to liquidate our financial obligations, I am of the opinion that if an advance could be made of, say, 100 per cent. on the prices which prevailed before 1914, this would create a normal and stable condition. I do not only mean 100 per cent. so far as lumber is concerned, but 100 per cent. advance in wages and every other line. You know, however, that the percentage in many cases is much heavier than that, and I am apprehensive that if a strong demand develops in the spring for all kinds of building and other materials, that the same state of affairs will prevail as we witnessed a few months ago. It would be a case of muddying the water a second time, and the result would be equally disastrous.

"There is a great shortage of building in my own and every other city, and thousands of houses must be erected. If market conditions should revive suddenly, we do not want a repetition of the artificial state of affairs which obtained some time ago, with prices running riot. It is too much like a dog chasing his tail and moving around in a circle. The present slow-up is, I believe, tending to help along readjustment in a most effective and substantial way, and once having gone through an unsound and artificial state, there is no reason, with the experience and insight which we gained during the past few months, why we should invite such conditions again.

"We are doing a moderate amount of business at the present time and naturally have curtailed production at a number of our plants, owing to decreased requisitions for forest products. The transportation situation is steadily improving and I look for business to revive rapidly next spring. With values more normal, construction should proceed on a scale that will in a measure relieve the present demand for houses. So far as our own plants are concerned, we have found our men generally more efficient than they were before the war. This has been brought about by co-operation with our superintendents and foremen and through them with the rank and file of our employees. We have sought to work with them to the fullest extent and see that they received a return commensurate with their industry. Our employees are contented and, the unit or standard of production, which we established in 1914, has been considerably increased by their united and individual effort."

Progressive Nova Scotia Organization

The up-to-date mill and woodworking plant being erected by the Miller & Gordon Mfg. Co., at Carleton, N.S., is rapidly nearing completion. The buildings consist of a three-storey sawmill, planing mill and woodworking plant, 125 ft. by 50 ft., having concrete foundations, together with separate boiler-house, engine room and dry kiln. In addition, a warehouse 90 ft. by 50 ft. is being erected at Brazil Lake Station, about five miles from the factory.

The products of this modern plant will consist of hardwood flooring, boxes, dowels, clothespins and toys of different kinds, together with lumber and building material, including mouldings, gutters, gutter-leaders, laths, shingles, etc. Most of the raw material will be secured from the company's own timber limits, which consist of about 10,000 acres of fine timber. These limits are situated near the mill so that hauling and lumbering expenses should be very low.

The equipment in the mill consists of a Waterous band mill, log haul-up, live rolls, trim saws, Oxford edger and other items which go to make up the modern sawmill. In the woodworking plant six clothespin lathes and slotters, revolving tumbler and drier, dowel planer, two W. S. Hawker adjustable head dowel machines, broom handle machine. Two Weymouth and three variety lathes go to make up the installation. The heating system for the clothespin drier was installed by the B. F. Sturtevant of Canada, Limitied, Galt, Ont.

The planing mill equipment consists of a band resaw, Cowan tenoner, Cowan surface planer, buzz planer, a number of trim and rip saws, box-making equipment, 10 in. American outside sticker supplied by the Garlock-Walker Machinery Co. of Toronto, and other smaller machines. The belting used in this plant is the well-known "Klingtite" brand manufactured by the Goodyear Tire & Rubber Co., with the exception of a leather belt for the main drive which was supplied by D. K. McLaren, Limited, of Montreal. A machine and blacksmith shop will be maintained to take care of all repairs.

Steam power is used, three 75 h.p. boilers having been installed. The engine is a 225 horse power Laurie engine, manufactured by the Laurie Engine Co. of Montreal.

The personnel of this progressive organization is as follows: W. E. Miller, president and treasurer; Winfield Gordon, vice-president, and Roy D. Miller, manager and secretary.

A miss is as good as a mile, but remember that you are not always missed, says the Safety League.

How Much Pressure Would You Apply?

Checks and Other Troubles Blamed on Wrong Pressure—How Pressure May Be Calculated—Proper Attention to This Subject Should Overcome Many Veneer Troubles

By C. J. Pratt

How much pressure would you apply to a batch of panels, 18 x 36, so as to obtain a calculated pressure of 100 lbs. per square inch. Endless trouble results when too much or too little pressure is applied, yet how many workmen know how to calculate the amount of pressure being used. It is doubtful if sufficient attention is being given to this phase of veneer work.

Some of the evils resulting from an improper application of pressure (too much or too little) are lack of contact between veneer and core, blisters and loose veneers, starved glue joints, short-lived and uneven cauls, excessive power consumption, if a power press is being operated, and other similar faults. To obtain uniform, satisfactory results the correct pressure per square inch for each wood and each size of panel should be known and some method worked out for applying just that amount. In a great many cases where trouble is encountered, the trouble lies with the pressure applied, yet as a rule anything else is blamed.

Causes Many Troubles.

The list of troubles resulting from applying the wrong amount of pressure would, therefore, seem to embrace nearly all the worries encountered in the manufacture of veneered products. This merely goes to show the importance that should be attached to ascertaining the correct pressure to use and to seeing that that amount of pressure is applied. An old veneer man recently made the statement that a large percentage of the checks common to veneered work was caused by using excessive pressure. It is not hard to understand how the fibre of a thin face veneer might be crushed and ruptured by heavy pressure, particularly if the core were hard or coarse-grained. There may be a lot of truth in the remark of this practical veneer man.

With the screw type of press, either hand or power, the amount of pressure applied depends largely upon the experience and judgment of the operator. In the hand type he has the feel of the lever or wrench to guide him, but at best it is largely guess-work. The operator of the power press, other than hydraulic, seems to go largely by the power delivered by the belt, keeping the press in operation until the belt slips, regardless of the size of panel that is being glued. The same amount of pressure applied to stock 10 x 20 and stock 30 x 60 would mean that the smaller pieces were receiving nine times as great a pressure per square inch as the larger pieces. Either the small surface was getting far too much pressure, which is probable, or the larger surface was not receiving enough. What is more than likely is that neither one was getting the correct amount.

This should not be hard to understand, as a certain amount of pressure applied evenly to a surface containing 500 square inches might amount to 50 lbs. per square inch. If this same amount of pressure were evenly distributed over a surface containing 1000 square inches, it would work out at 25 lbs. per square inch. This shows why the total amount of pressure applied should be governed entirely by the area or size of the panel being glued.

Pressure Under Complete Control.

The hydraulic press is found in many plants, and with such an installation, the pressure applied to any panel may be readily worked out. This is done by multiplying the area of the ram by the reading of the pressure gauge, and dividing by the area of the panels. This gives the pressure on panel per square inch. To find the gauge reading for a given per square inch

LONG-KNIGHT LUMBER COMPANY

INDIANAPOLIS - - - IND.

pressure on a panel of a given size, multiply the pressure required per square inch on the panel by the area of the panel and divide by the area of the ram. If exact figures are desired, the weight of the platen should be taken into consideration, but the above method is near enough for all practical purposes. In order to make this method of calculating pressures perfectly clear, the following formulas are reproduced:

$$(1)\quad G = \frac{P \times A}{R} \text{ or}$$

$$(2)\quad P = \frac{G \times R}{A}$$

where G —gauge pressure in pounds per square inch.
P —pressure on panels in pounds per sq. inch.
R —area of piston or ram in square inches.
A —area of panel in square inches.

This shows how the calculating is done. Simply replace the symbols by the figures which apply and work out to a conclusion. Using this system, a table could be worked out, giving the pressure for the different sizes of panels.

The accompanying table is worked out to 100 lb. per square inch and would have to be varied for different working pressures. Using this as a basis, a table could be readily tabulated, showing the gauge reading for the pressure used in any particular shop. Thus, if 125 lbs. per square inch is required, multiply the figures given by 1.25 or merely add ¼. Other pressures may be secured in a similar manner. A good suggestion would be to cut this table out and paste it up near the press where it would be convenient to the operator, or, better still, work out a table, showing the correct gauge readings for the pressure used in your shop, and attach it on or near the press.

Room for Experiments.

It would, certainly, be well worth while for the foreman in charge of the veneer department or the man operating the press to do a little experimenting so as to ascertain the most suitable pressures for the glue and woods used in that factory. In doing this, it would be necessary to separate a few of the test pieces so as to get an idea of the glue line, or, in other words, the amount of glue remaining between the layers. If owing to high pressure, the glue had either been forced out at the sides or into the wood, giving what is known as a "starved joint," this could readily be detected upon examination. The separation of a few plys would also enable one to make sure that sufficient pressure had been applied to give a perfect contact. When once a suitable amount of pressure per square inch has been established, it need not be varied very much except that some of the softer, thinner face veneers cannot withstand the same amount of pressure that heavier and, perhaps, denser veneer will. It might be well to bear this point in mind and not go the limit where some of the more delicate woods are used.

Judging and Selecting Most Economical Glue

Upon Glue Used Depends Quality of Product — Points That Should Be Considered—Buyer Should Study This Important Product—Cheapest or Most Expensive Not Necessarily Most Economical

By William Stetter

This article shall deal with the lack of knowledge of the consumer. In considering this, it must be understood that glue is a material which is not standardized, and therefore an allowance must be made where knowledge is lacking. Men who are selling glue daily know very little about the subject, leaving the consumer in a position where he is compelled to make his own experiments to obtain the knowledge necessary to assure intelligent buying, or obtain his information from commercial glue experts. Existing conditions can only be overcome when the men who are supplying glue to the consumer will give the subject more careful study and furnish the consumer with the knowledge thus obtained.

The study of glue and its practical working qualities is a very interesting one, and the more it is studied the nearer it will bring about a more intimate relation between the supplier and consumer. While it is important that the men who represent the supplier should obtain more practical knowledge of glue, it is much more important that the consumer give it very careful study, particularly when the product of his factory, and sometimes his reputation, depends upon the quality of the glue which he uses.

Difficult Material to Judge

Most other materials which he purchases are standardized or can be tested for quality—veneer, hardware, lumber, glass, paper, etc.—but not glue. Standardization of glue can only be accomplished in continued study, tests and comparison. On other material he can become expert in determining quality in a very short time and can detect almost immediately any difference in quality from the grade or kind originally purchased. Glue is a different proposition. It takes a long time to be able to distinguish a difference in grades. Probably this is the reason why the consumer does not give the glue question more careful attention. The buying of glue should be handled just as systematically as any other branch of the consumer's business; he should be in a position to detect any change in quality of shipments or in the practical working.

When you consider that hundreds of thousands of dollars are wasted annually by the glue consumers of the United States you must agree that something is materially wrong. This something is nothing more nor less than the consumer's lack of knowledge; it is the cause of this tremendous waste, and should be stopped.

Buyer Should Have Knowledge

By the consumer we mean the actual buyer or purchasing agent, not the men in the work-room. The buyer should go into the study personally; he should make tests of all samples submitted, study the difference in grades and working qualities. He should be able to determine body strength or viscosity, foam, grease, acid, jelly strength, or Cooper grade, proportions, spreading capacity, etc. Why should he go to the workmen for any information on the subject? It doesn't make a bit of difference to them what price

Announcing Our New Million Dollar Plant

A million dollar investment in a veneer and hardwood sawmill plant is evidence of an operation of unusual scope. In this announcement is pictured the completed million dollar unit, the latest addition to the manufacturing facilities of the Wood-Mosaic Company, Inc., which, established in 1883, has since been building and perfecting its organization.

W. A. MacLean, as president, has been the inspiring genius of the company during all these years of greatest progress. The definite objective of our entire organization has been the perfecting of an operation and personnel capable of maintaining and expanding a many years' precedent of perfect output.

Expert service can be temporarily employed for the purchase of one big tract of hardwoods. However, to bring to our log yards only the very cream of all the best offerings of timber, we have built up a timber department which today is steadily employing twenty field men, all of

whom have been carefully trained for our requirements. Thus our many millions of feet of timber reserve include only timber picked expressly so that our reputation as ranking specialists in quality quartered white oak and walnut might never be even slightly impaired.

Today seventy-five per cent of our timber is of the famous Kentucky growth. The balance stands in Indiana and Ohio with a more limited amount in Tennessee.

The product of these rigidly selected logs is directed to one or the other of our operating units according to its best adaptability. Thus our single band mill at Cincinnati cuts nothing but the highest grade of quartered white oak and walnut, while the band mill at Jackson, Tenn., produces a general line of hardwoods. The third single band mill operation at New Albany, Ind., is devoted to the careful production of plain and quartered oak. In conjunction with the New Albany plant is our large parquetry flooring factory which has achieved an international reputation. The eastern flooring sales office and warehouse are in the Bush

steel construction throughout. Total floor space four acres. Every machine individually motor-driven. Glimpse of big sawmill at extreme left.

Terminal building, Brooklyn, N. Y. The flooring department is under the supervision of H. H. Barclay.

The keystone to the lumber department is the great, modern double band mill at Louisville, which is pictured on the centre page of this announcement. The modernness, capacity and equipment are well described in the caption under the illustration. The special feature at the Louisville plant is the battery of dry kilns with a capacity of 500,000 feet per month. These Emerson moist air kilns are now open for a considerable volume of commercial kiln drying. The entire lumber department is under the management of W. H. Day.

The veneer department also is divided into several units so that proper manufacturing facilities may be provided for each type of log. The veneer plant at Huntington, W. Va., with its full modern equipment cuts nothing but high grade rotary cut yellow poplar cross-banding. The veneer plant at New Albany, Ind., has six modern veneer saws all operating continuously on strictly high grade quartered white oak veneers.

LOUISVILLE, KENTUCKY,

VENEER DEPARTMENT—A part of our large stock of sliced American walnut veneers at Louisville plant. Note particularly the careful method of bundling and tagging the individual flitches. Note also the results of perfect "Philadelphia drying" as the stock shows no broken ends and lays PERFECTLY FLAT.

The ace of the veneer department is the big plant just completed at Louisville, Ky. It is the last word in efficiency of equipment and layout. A full quota of slicers and rotary machines, specializes in cutting into veneers the best black walnut logs and burls that twenty experienced log buyers can locate and is under the management of J. J. Egan and H. C. Hobbs. In addition, two special lathes are devoted entirely to rotary-cutting thin yellow poplar cross-banding.

Every purchasing agent knows the value of having a consistently dependable shipper of uniform goods. This advertisement announces to such buyers the final completion of a carefully built organization, equipped with a skillfully planned operating department, and schooled by forty years' quality training to unfailingly offer a quality product.

The best obtainable quartered white oak, poplar, ash and other hardwood lumber, sawed quartered oak veneer, walnut lumber and sliced and rotary cut walnut veneers, rotary cut yellow poplar cross-banding are now offered to the trade. Remember each product is made on a separate manufacturing unit equipped for the particular service which it must perform. The tremendous investment is the best possible insurance of unceasing integrity of motives and methods.

This completed organization offers its services to all users of the high grade products listed above.

Judging and Selecting Most Economical Glue

(Continued from page 116)

he pays for his glue; they have no vital interest in the business. The glue that does their work with the least effort is the glue they want to use, regardless of whether other grades are best adapted for the purpose, or cheaper. Manufacturers spend large sums in sending out working samples; these samples are sent to the workroom for test and comparison. In most cases very little attention is given them by the actual users (the workmen); it takes up too much of their time testing samples; the result is, either they are never tested or else condemned as being inferior to the quality which they have been accustomed to use. This is an actual fact and an injustice to the supplier. In many cases I know where glues have been condemned by the workmen, which were far superior to the grades used and which would have meant a considerable saving to the consumer if he had personally supervised the tests.

How Information May be Secured

It is true that buyers are usually very busy men, but the very fact that they are purchasing an article which plays such an important part in their business is the one reason why they should give the subject more study and attention. If the buyer cannot find the time to give the subject the attention which it requires, he has the option of consulting experts who will make the necessary tests for him, giving a full report and an unbiased opinion on samples submitted for such tests; they will be able to help him in many ways. If experts were consulted more often the tremendous waste mentioned previously would be entirely avoided. Personal knowledge, however, should be one of the essential requirements of a successful glue buyer. When he has mastered the subject to an extent where he will be able to determine the slightest difference between grades, then, and not until then, will he be able to show a saving on his glue bills.

Regarding the consultation of experts, the consumer might ask: "Why cannot this information be had from the manufacturer?" Why, indeed! For many reasons, principally because most consumers do not wish to study the subject, and while the manufacturer has tried to enlighten the consumer regarding the difference in grades, it would be undiplomatic to show him where he could reduce his (the consumer's) glue bills when he seems satisfied to give the manufacturers the additional amount of money which he is wasting yearly. You cannot, on the other hand, expect men in the manufacturing line (who have made a careful study of the subject) to give the consumer the benefit of their knowledge unless they are compensated in some way. Their business is to supply you with a satisfactory glue. If you are paying a higher price than is necessary, through waste or initial cost, you cannot blame the supplier. It is your loss and his gain. Your supplier should be compelled, however, to give you the strength, water-taking qualities (proportion of glue and water) and the spreading capacity of the grades which he supplies. If he cannot do this, you should consult some one who can.

Who Pays the Bills?

A difference in price on a given Cooper grade varies as much as 1 to 3c per pound. Who pays the difference? The consumer who knows the least about the subject. Whether a consumer pays the maximum or the minimum price for his glue cannot be determined until he is in a position to make the necessary tests and comparisons.

Don't you think it would be worth your while to give this matter serious thought? Wouldn't you like to bring about a big saving on your yearly bills? Won't you, as a consumer, give more attention to the subject than you have heretofore? Wouldn't you like to be able to give your men better information regarding the subject than they are now giving you? There is only one way to overcome every obstacle and annoyance in the handling of glue—knowledge.—"Veneers," Indianapolis.

New Veneer Industry at Waterville, P.Q.

At last the demand for rotary cut veneers in Canada would appear to have been solved—at least in part—by the establishment of an important new industry at Waterville, Que., where the old factory of Geo. Gale & Sons, Limited, has been taken over by the Waterville Veneer & Panel Company, Limited, by whom it is now being rebuilt and equipped with the most up-to-date machinery and appliances known to the trade.

The daily cutting capacity of the new mill will be a carload of single veneer, and that of the plywood plant 20,000 feet.

The Company owns large stumpage rights and is assured of a plentiful supply of veneer logs for at least twenty years.

Operations are scheduled to commence early next year, and the company will shortly be in a position to take care of orders for forward delivery.

The new industry will be directed by Mr. H. Lefeber, formery of Montreal, but now in residence at Waterville. Mr. Lefeber, who is widely known to the trade, is the Vice-President and General Manager of the Waterville Veneer and Panel Company, Limited.

Moisture Content of Wood

Even after long exposure to the same atmospheric conditions, different pieces of wood do not have exactly the same moisture content. Variation of 2 per cent. were recently found in red oak blocks stored under carefully fixed humidity conditions at the Forest Products Laboratory.

These moisture differences, unlike variations in strength, are apparently independent of the density of the pieces. In the laboratory experiments, the variation proved to be as great in blocks of the same density as it was throughout the lot of specimens. Moreover, the range in moisture content was the same in wood of medium density or high density.

Data on a few representative specimens are given in the accompanying table.

Density of specimen	Average moisture content in percentage of weight oven dry. Relative humidity at 80° F. 38%	61%	88%

Period furniture, so popular today, finds beautiful interpretation in N.B. Quality sliced figured gum.

NICKEY BROTHERS, INC.

MEMPHIS, TENN.

Adaptability of N. B. Quality Red Gum Veneer to Period Furniture

The apparent frail structured chairs of Sheraton or the more robust work of Chippendale, the rectangular tables of the Adam Brothers, or the stately creations of the Louis' periods are equally capable of beautiful reproduction in Figured Red Gum.

Replicas of the creations of the great cabinet makers of the past are certain of instant appreciation when the veneer employed is N. B. Quality.

The Lumber Market

Domestic Woods

Business continues quiet, seems to sum up the situation with regard to native wood. Demand is very weak, with very little stock moving. Some price recessions have been made, but such reductions as have taken place have not resulted in increased sales. It does not seem to be a case of where lumber is not moving on account of the price being asked as much as the fact that the manufacturers of wood products and other wood users find they are catering to a stagnant market and therefore do not need the lumber. A certain amount of birch and maple is finding its way to the American market, some of this was ordered a few months ago while the balance represents business which has been placed recently. The cost of manufacturing lumber has never been as high as it is today, which coupled with the uncertainty which exists in the lumber field, has had a tendency to curtail production in the woods. Just what effect this will have on prices depends on the demand. An increased demand with low production can mean only one thing—stiffer values. The general opinion among lumbermen is that prices will not drop much lower and in all probability will go higher, though some do not expect to see quotations reach the high mark set last year. At the present moment certain manufacturers of southern pine are dumping some surplus stock on this market at prices averaging around $40. This is a very low figure and just what effect it will have on the softwood market depends upon the quantity of pine being offered.

The same quietness exists in the hardwood market. Prices have receded from 10 to 20 per cent. without bringing out any buyers. Certain American manufacturers are interested in F.A.S. birch, but very little is available. There is also a slight movement in maple. This is chiefly from the eastern states. The lumbermen themselves think that higher prices would be harmful, but cannot see how an increased demand could help but boost prices. Housing accommodation is needed badly and cannot be put off indefinitely, regardless of how values may go. Increased construction would mean increased business for furniture factories and all industries catering to the building field. Demand seems to be the crucial point upon which the whole situation hinges.

Imported Woods

The lumber situation is most difficult to size up. Why should prices drop? Production costs are high, probably never were higher, and while the cost of production on certain items did not warrant the peak prices of a few months ago, yet certain stocks are being offered below cost at the present time. Lower values have not stimulated buying as purchases are being made from hand to mouth. Lumber manufacturers finding that they cannot dispose of their product and not being possessed of unlimited capital are forced to curtail production if not cease operations altogether, until conditions right themselves. This is what has happened in a large number of instances. While a decreased production will not have much effect on the present market, yet the fact that logging and manufacturing is not being carried on to capacity will have a serious effect should the demand stiffen. One investigator who recently covered the Memphis district reports that fully fifteen per cent. of the mills there have closed down and in another three weeks or a month about fifty per cent. will have ceased operations, unless conditions right themselves. One large manufacturer who has just closed his plant writes the "Canadian Woodworker" to the effect that quotations on gum have declined about 35 per cent. from peak without stimulating sales. Many items are selling below cost of production. This cannot continue indefinitely. The opinion is ventured that gum stocks are below normal and that conditions will change inside the next sixty days, with stiffened prices prevailing. Another lumberman, when asked his opinion on the oak market, stated that conditions are very quiet. Very little stock is moving regardless of price recessions. Production being curtailed as manufacturers cannot carry large accumulations of lumber. Production in excess of demand but demand far below normal. This writer thinks that there are many fine bargains to be had if the wood users are in a position to take advantage of them. Regarding walnut, a writer offers the opinion that walnut stocks are plentiful and well assorted but that the log supply is 20 per cent. less than it was a year ago. Walnut stumpage is scattered and in the hands of prosperous farmers, who are holding for big prices. Slight recessions have been made on walnut. On the other hand, walnut did not advance as high or as rapidly as some of the other woods. The demand for walnut is stronger than that for other wood and in addition the export demand is increasing. This would all seem to indicate that lower prices on this wood are not likely to prevail.

As heretofore, demand, not manufacturing cost, will be the determining factor in the lumber market. We do not see anything that would indicate an increased demand in the immediate future. Building conditions are likely to remain quiescent until spring and the wood users are not exhibiting a tendency to stock up under present conditions. On the other hand, manufacturing costs on all woods were never higher. Most of the stock is in strong hands. Production is undoubtedly being curtailed, therefore it would appear as if a wood user would not go far wrong by buying some of the attractive lots that are being offered.

Demand for Caskets with Colored Covers

The evolution of caskets has been from painted and grained wood to the cloth covered product. Formerly the covering used was black broadcloths and other suitable materials. Recent years have shown a marked change. While the cloth covered caskets still holds first choice the sombre blacks are no longer in evidence, having been replaced by brighter hues, such as lavenders, pinks, blues, etc. A Toronto casket manufacturer recently held an exhibition at his plant. The display included caskets in aluminum, gray, plum color, purple, grey, striped material in various shades and conopied caskets and couches trimmed with brocades in delicate shades of pink, blue and green. Slate caskets in solid walnut, oak or mahogany are still in demand.

Automatic Control

versus

Hand Control

By W. P. Powers

The Powers Regulator Company of Chicago, recently moved into their new and up-to-date factory building which had been under construction for more than a year, the untoward conditions in building and material lines having greatly retarded its completion. This move prompted their president, Mr. W. P. Powers, who founded the business more than thirty years ago, to write a review of their progress, for publication in their house organ, "Tuesday Talks," from which we quote: "My thoughts go back to 1890, and the little room, 12 by 16 feet square, from which were turned out the first House Regulators made in Chicago, the space having been given us by the courtesy of the Union Wire Mattrass Co., of which my father, David J. Powers, was president. This limited space was,

W. P. Powers, Pres. Powers Regulator Co., Chicago

however, soon outgrown, and we moved to 90 Illinois Street. Here we had about eight hundred square feet in the machine shope of Crary & Son, and put in our first meagre mechanical equipment, with which to do our own machine work.

Healthy Growth Necessitated Larger Premises.

This space soon proved inadequate and the World's Fair in 1893 found us occupying about four thousand square feet, on the third floor of the same building, with an office on the floor below, where we engaged our first stenographer. Soon after we moved our office to 36 Dearborn Street, and began operations in school buildings. Our first Thermostat controlling with air pressure was brought out in 1895.

About fifteen years ago we purchased from the Union Wire Mattress Co. the building where we made our humble beginning with a floor space of less than 200 square feet, having developed the business by that time to a point that required about 8,000 feet. As the business grew year by year, we spread over the other floors, crowding out the tenants one after another, until, when we left, we were occupying about twenty-six thousand square feet of space.

New Lines Brought Out.

During the last seven or eight years our line of specialties has been developed, requiring more and more room, for which we are now well provided, having a space of about forty thousand square feet, all in a fireproof building. Here we have no haunting fears of burning, and have what we have long wished for: the office and factory under one roof."

While the business of the company was for many years confined almost entirely to the regulation of living room temperatures, it later became evident that there were a great many industrial processes involving the use of heat where automatic control would be desirable for many reasons. It was to meet this need that we developed the "Specialties" referred to in the last paragraph.

One of the first propositions which claimed attention was a battery of four dry kilns used by the Lyon & Healy Co. of Chicago for drying hardwood lumber. Under the system of hand temperature and humidity control, then in use, it was requiring approximatetly 30 days to dry a kiln of green oak lumber of certain dimensions.

Applying Automatic Control to Kiln.

We undertook to improve this condition, with the result that an automatic regulator which permitted heating the kiln to an exact schedule, was developed and applied. The amazing result of a kiln full of properly dried lumber in less than two-thirds of the time formerly required, with a considerable improvement in the quality also was secured. It was discovered that once the temperature in this kiln was properly established and maintained, the control of the humidity, which was accomplished by steam sprays, became very greatly simplified. Since then, in co-operation with the Humidity Control Co. of Indianapolis, Indiana, we have developed a wet and dry bulb humidity control for application to lumber kilns in connection with the temperature control.

In addition to the kilns there are varnish and paint drying rooms, glue treating processes, wood preserving operations, and many other processes incident to the wood-working industry which require automatic control to make them effective, and this company has developed a variety of regulators, especially adapted to them, which are meeting with much success.

SPOT

SERVICE IS AN ASSET *To any* LUMBER BUYER

CONSISTENTLY good service has for many years been one of the assets of our organization. This service is neither a myth nor a boast, but is based on real facts. In the first place the geographical location of our operation and timber, and our relation to trunk line railroads gives us the advantage in securing cars under all conditions. This was clearly demonstrated in the car shortage of this year.

In the second place, as the above map indicates, the flow of our product from the sawmills to all consuming points is smooth and uninterrupted. This holds good for export as well as for domestic shipment, and is an easily provable statement.

The third reason is that our entire organization was built about the one thought of offering unusual and unique facilities. Our product is diversified, offering a selection of about all southern hardwood forest products the average consuming factory requires.

This service should be especially helpful to buyers requiring quick shipment under present conditions.

OUR FOUR MILLS PRODUCE 200,000 ft. DAILY

Information and Inquiries

You are cordially invited to make use of this department

How One Firm Overcame Checks in Walnut

Napanee, Ont., Sept. 30/20.

Editor "Canadian Woodworker":

The inquiry in the September Canadian Woodworker evidently refers to one of the troubles that, we think, all of us have, more or less, in veneering walnut.

Our company have bought panels from many panel manufacturers in the United States, and in practically all of these lots we have a few that show checks such as mentioned in the inquiry. In the solid we do not have any such trouble. One reason for checks in veneer work is the application of too much pressure in the veneer room. By regulating this carefully we have been able to do away with considerable of this difficulty.

Yours truly,
The Gibbard Furniture Co., Limited.

Checks and Their Cause

London, Ont., Oct. 9, 1920.

Editor "Canadian Woodworker":

The subscriber who is experiencing trouble from checks in walnut is not experiencing anything new. All wood-users are bothered more or less by checks. The basic cause for these cracks or checks is moisture in the wood. This may have been in the stock when it was brought into the factory or absorbed by the wood as it was being worked up. The lumber should be well kiln dried in a kiln where the humidity is under perfect control. Sometimes checks will show up, if the drying is pushed too much, and then close up again. Even though they closed up and are not visible, the broken fibers have not mended and the checks will open up again if placed in a warm dry place. The stock should be tested for moisture content before being removed from the kiln. If dry when taken into the factory and handled so that it does not have a chance to absorb any excess moisture, no trouble should be experienced from checking. Material piled near an open window during a wet spell, while not exposed to the rain, will take up enough moisture from the air to cause trouble. If the checks appear on veneered work, there may be several causes, such as damp face veneers, too long a period between gluing and the application of pressure, too much pressure, poor drying methods, not drying thoroughly, exposure to dampness after drying and careless handling. If this manufacturer will see that his stock is dry to start with, is kept dry and is not exposed to any hot, dry air while in the factory, varnish drying kilns or store-rooms, it is not likely that checks will be encountered.

Yours truly,
J. A. Wilson.

The Proper Drying of Walnut

Cowansville, P.Q., Sept. 28, 1920.

Editor, "Canadian Woodworker:"

Replying to the enquiry in the September issue in regard to walnut checking, there is only one reaason for these checks, viz., improper drying. If the material checks at the ends, either cracks in the solid wood or the joints opening up at the ends, it is not dry enough and if the cracks are in the surface of the material it was too green when put in the kiln and should have been well steamed. If the walnut is well air seasoned it does not require so much steaming, but should have about 80 hours drying at about 160 degrees in a well ventilated kiln, but if the lumber is not well air seasoned then it should be well steamed in the kiln to prevent the surface from cracking open by drying the outside of the wood faster than the middle. I judge that their trouble is caused by the material checking at the ends owing to their not drying it long enough.

Yours truly
George H. Hawley

Information on Grading Rules

Meaford, Ont., Oct. 5, 1920.

Editor, "Canadian Woodworker."

Will you be good enough to tell us where we can secure a copy of the grading rules applicable to southern pine, cedar and similar woods, aso for western woods, such as pine and cedar? Your kindness will be appreciated. Yours truly,

The Knight Mfg. & Lumber Co.

The rules required could probably be secured from the following sources: Mr. A. L. Clark, the Southern Pine Association, Live Oak, Fla.; T. A. McCann, Western Pine Manufacturers' Association, Buid, Ore., or E. G. Ames, Pacific Lumber Inspection Bureau, Seattle, Wash. The Forest Service branch of the U.S. Department of Agriculture, Washington, D.C., issue copies of the different grading which they will gladly furnish on request.

Books on Furniture Design

New Westminster, B.C., Sept. 27, 1920.

Editor, "Canadian Woodworker:"

Can you tell us where we can obtain books of design, giving measurements, working drawings, etc., of modern furniture, especially of mission style?

Yours truly,
Laminated Materials, Limited.

Books on the different period designs which are so popular to-day may be obtained from J. P. Lippincott & Co., Philadelphia, while the Popular Mechanics Publishing Co., Chicago, Ill., have several volumes on mission furniture. This latter style is not so popular as it was a few years ago, having been supplanted by the more attractive period furniture.

Chair and Table Legs Wanted

A subscriber wants to know where he can purchase a quantity of chair and table legs in different period designs. Anyone desirous of securing this business can secure further particulars by writing the publishers of this paper.

Maple Flooring Wanted

A firm in Scotland are in the market for a quantity of maple flooring in the following sizes: 3" x 1 1/16 or 3" x 1⅛. These are finished sizes. The flooring is to be tongue and grooved, hollowed and end matched ready for laying. The name of this inquirer may be secured by writing the publishers of the "Canadian Woodworker." Refer to inquiry No. 2004.

Hardwoods

When you need soft texture Northern Oak or Mountain Poplar in most any grade 1" to 4" thick, you will invariably find by writing or wiring me that I can furnish it.

My prices are no higher than you would pay elsewhere for the same quality of stock. Immediate loading is guaranteed, as my stocks are assembled at a point where empty cars are at all times plentiful.

HAY & CO., Ltd., Woodstock, Ont.

News of the Trade

John Deere Mfg. Co. Welland, Ont., have commenced work on their new dry kiln.

The Bolton last plant of George Willard & Sons, Mansonville, P.Q., was destroyed by fire recently.

DeGrandpre & Caron, Ville St. Mithel, P. Q., were recently registered as manufacturers of wood specialties.

The Western Broom Mfg. Co., Winnipeg, Man., recently equipped a factory for the manufacture of brooms.

The plant of the Doon Twines, Limited, Kitchener, Ont., was recently damaged by fire. The loss is fully covered by insurance.

Part of the shipbuilding plant of the Sovereign Salvage Co., Liverpool, N. S., was destroyed by fire. The loss amounts to $10,000.

Walter & Myers, Montreal, P.Q., with Chas. O. Walter and Leo Myers, as proprietors, were recently registered as manufacturers of furniture.

A. Bowser & Sons, Liverpool, N.S., sawmill operators, are installing machinery to manufacture boxes. A band resaw and a cut-off saw has been added.

A. Bellamy, Carleton Place, Ont., is erecting a small woodworking shop and has installed a jointed and a planer. Other machines may be put in at a later date.

Work has been started on the new auto body factory of the Tilbury Auto Body Co., Tilbury, Ont. This factory when completed is to cost in the neighborhood of $40,000.

The Preston Furniture Co., Limited, Preston, Ont., have been authorized by supplementary letters patent to increase their capital from $100,000 to the sum of $250,000.

John Davidson, Smith's Falls, Ont., contemplates enlarging his planing mill and adding some new equipment to engage in the manufacture of caskets and coffins.

The sash and door factory and sawmill being erected at Maniwaki, P. Q., by J. & H. Ramberg, is rapidly nearing completion. This plant will cost about $10,000.

Certain changes have taken place in the partnership known as the Canadian Pattern & Woodworking Co., Montreal. J. & E. Laurendeau are now the regihtered proprietors.

Owing to the demand for power made by the Canadian Edison Co., Limited, of St. Thomas, the Hydro-electric Commission reecntly issued an order prohibiting the use of all types of electrically-heated apparatus in that city.

Recent Montreal registrations include the Canadian Reed & Rattan Mfg. Co., the Globe Toy Mfg. Co., the Piano Lamp Co., the Imperial Upholstery Co. and the Wood Pipe Co., Limited.

Beatty Bros., Fergus, Ont., are considering plans for an addition to their London factory. It is expected that an announcement regarding this development will be made in the near future.

The sawmill and plant of the Joseph McGill Shipbuilding & Transportation Co., Shelburne, N. S., has been completely destroyed by fire. The loss is in the neighborhood of $10,000.

Don-o-Lac Co. of Canada, Limited , have leased suitable premises at 80 Murray St., Hamilton, Ont., and will commence the manufacture of their line of shellacs, enamel and finishing materials.

Millard Bros., lumber dealers, Liverpool, N. S., have recently equipped a box factory. The following machines have been installed: Cowan band resaw, Cowan boxboard matcher, C. M. C. moulder, C. M. C. surface planer, and a number of small saws.

The Ruggles Motor Truck Co., London, Ont., have commenced the construction of a large factory in that city, The new building will be two storeys, steel and concrete construction, 85 x 425 ft., and when complete will cost in the neighborhood of $200,000.

The Prince Rupert Drydocks & Engineering Co., Prince Rupert, B.C., is negotiating with the Mexican Government for the construction of a fleet of thirty-seven vessels. Should this contract be received the work will likely be divided up among the different shipyards on the Pacific Coast.

James Crow, Company, Limited, Toronto, Ont., have been granted a provincial charter to manufacture and deal in wagons, carriages, aeroplanes and other wood products. Capital, $40,000. H. L. Steele and G. M. Willowby, barristers, both of Toronto, are two of the incorporators.

Fulton Motors, Limited, Toronto, Ont., were recently granted a federal charter to manufacture and deal in motor trucks, boats, aeroplanes and other wooden vehicles. Capital, $2,000,000. A. W. Briggs and E. M. Dillon, barristers, both of Toronto, are two of the incorporators.

The Hydrola Phonograph Co., Limited, of Toronto, Ont., are reported to have taken over the plant of the Canadian Symphonola Co., Brock Ave., Toronto. This company contemplate manufacturing a line of electric phonographs.

A large truck-load of fruit baskets manufactured by the Port Hope Lumber & Veneer Co., Port Hope, Ont., recently took fire when in transit between Port Hope and Hamilton. The baskets were completely destroyed but fortunately were insured, so that the loss was fully covered.

The Continental Wood Products Co., Limited, Montreal, Que., were recently granted a provisional charter to carry on their business in Ontario, provided the capital employed does not exceed $1,700,000. W. J. McWhinney, of Toronto, has been appointed the company's attorney.

The woodworking plant of the St. Thomas Boxes, Limited, St. Thomas, Ont., has been purchased in bulk by the Clark Machinery Co. of London, Ont. The St. Thomas Boxes are confining their output entirely to paper and cardboard boxes.

The Davison Lumber & Mfg. Co. of Bridgewater, N.S., are installing in their box factory a 350 h.p. Waterous engine and a 56 x 16 Waterous R. T. boiler, making a battery of three in the plant. The capacity of the factory has recently been increased by about 30%.

The Lincoln Basket Co., Limited, St. Catharines, Ont., have been granted a provincial charter to manufacture and deal in baskets, boxes, and all kinds of wooden containers. Capital $40,000. H. H. Collier and J. G. Schiller, solicitors, both of St. Catharines, Ont., are two of the incorporators.

Russell & McAulay, Halifax, N.S., contractors and engineers, have recently installed a woodworking plant to manufacture their own sash, doors and interior trim. Among the equipment in operation is an Elliot combination woodworker.

Brasseur Lectere, Limitee, Montreal, P. Q., have been incorporated to manufacture and deal in carriages, furniture and all kinds of wood products. Capital $60,000. Two of the incorporators are S. Brasseur and E. Leclere, mechanics, both of Montreal.

Langslow, Limited, Cobourg, Ont., were recently granted a federal charter to manufacture and deal in all kinds of furniture. Capital $500,000. Two of the incorporators are H. R. Langslow, manufacturer, and J. W. Spragge, bank manager, both of Cobourg, Ont.

John Boshart, lumber retailer of Milverton, E. R. Nafziger of the B. & N. Planing Mills, Milverton, and others have formed the Milverton Furniture Co. with a capital stock of $200,000. The chief place of business of the company is Milverton, Ont.

The Anglo-American Auto Co., Royal Bank Bldg., Toronto, have had plans drawn for a motor car factory to be erected at New Toronto, Ont. The building is to be monitor type, one storey, steel and brick construction, 220 x 1100 ft., and will cost in the neighborhood of $500,000. This concern will manufacture the LaMarne motor car.

The McLagan Phonograph Corporation, Limited, Stratford, Ont., have been granted a federal charter to manufacture and deal in phonographs, furniture and all kinds of musical instruments. Capital, $300,000. D. M. Wright and W. J. Anderson, manufacturers, both of Stratford, are two of the incorporators.

Pyke Motor & Yacht Company, Limited, Montreal, Que., have been incorporated to manufacture and deal in automobiles, trucks, aeroplanes, boats and other water and land vehicles. Capital $200,000. Two of the incorporators are L. P. Crepeau, K.C., and M. Dugas, advocate, both of Montreal.

Geo. Gale & Sons, Limited, Waterville, P.Q., have, by letters patent, changed their name to the Waterville Veneer & Panel Co., Limited. The powers of the company were extended to allow them to manufacture and deal in glues and wood products of all kinds, including lumber, timber, veneers and panels, etc.

The will of the late Jacob Kaufman of Kitchener, which was recently filed for probate, shows that he left an estate

Master Clock

International Electric Time Systems

Need Be

Neither Expensive Nor Elaborate

With an International Electric Time Keeping System a small factory, without taxing its resources is enabled to keep pace with all the demands of modern business.

Here is a suggestion for a system

1 Master Clock **1 "In and Out" Recorder**
1 Secondary Clock **1 Cost Recorder**
1 Time Stamp for Manager's Desk

Make your appropriation modest if you will, we will supply you a system to meet your needs

Secondary Clock

Time Stamp

"In and Out" Recorder

Cost Recorder

A MASTER CLOCK in the Manager's office will control by electrical connections as many units as you desire to instal. Starting and stopping time may be announced by means of a bell-ringing system.

A SECONDARY CLOCK where the men can see it will keep them busy until the last minute without the loss of time resulting from frequent consulting of watches of "guesses" at the quitting hour.

THE ELECTRIC TIME STAMP is invaluable in any kind of manufacturing activity. Month, day, hour and minute may be indelibly stamped on letters, invoices, agreements or any other business document—establishing a record beyond dispute.

THE "IN AND OUT" RECORDER gives to the employer at any time a complete printed time record of his workmen, ready for pay-roll totaling.

THE COST RECORDER is the "First Aid" of the Manufacturer in classifying labor costs, both productive and non-productive.

Full information gladly sent on request

International Business Machines Co.

LIMITED

F. E. MUTTON, Vice-President and General Manager

Head Office and Factory: 300-350 Campbell Avenue, Toronto

HALIFAX, 44 Granville St. ST. JOHN, 18 Germain St. QUEBEC, 506 Merger Bldg. MONTREAL, 1 and 3 Notre Dame St. OTTAWA, 190 Queen St. TORONTO, 409½ Yonge St. HAMILTON, 228 King St. E. LONDON, 489 Richmond St. WALKERVILLE, 44 Lincoln Rd. WINNIPEG, 227 McDermott Ave. VANCOUVER, 110 Water St.

Also manufacturers of Dayton Scales and Hollerith Electric Tabulators

valued at $9,111,674. In this amount was included $150,000 in the stock of the Jacob Kaufman, Limited, planing mill, $150,000 in the Dominion Wood & Lumber Co., and $325,000 in the Kaufman Rubber Co.

Elgin Handle Co., Limited, of St. Thomas, Ont., are very busy at the present time. They have succeeded in making several overseas connections and are doing considerable export business. One of their largest customers is located in South Africa. Shipments are going forward to that locality on practically every boat.

Wm. Gunn & Co., Wingham, Ont., have purchased the plant of Walker & Clegg and will convert it to the manufacture of phonographs. Some new equipment is to be added. A by-law was recently carried granting a loan of $10,000 and a fixed asseshment, for a period of seven years, of $10,000. About 100 hands will be employed. Wm. Gunn of Saginaw, Mich., is promoting the new company.

The Lee Mattress Co., Owen Sound, Ont., have purchased what is known as the McKay-Rutherford property. This is a large factory building which has been used as a carriage factory for a number of years. During the past year the Lee Company have occupied one floor of the building, but have outgrown these quarters and contemplate using the whole factory.

The Shurly-Dietrich Co., Limited, of Galt, Ont., with branches at Vancouver and Ottawa, recently staged a very interesting competition at the Vancouver Exhibition. They took a large bottle and filled it with saw teeth and offered prizes for those guessing nearest to the correct number. The bottle contained 28,306 teeth and the lucky winner's guess was 28,304.

The Adams Waggon Co., Limited, Brantford, Ont., a subsidiary branch of the Cockshutt Plough Co., have taken over the plant of the Petrolea Waggon Works, Petrolea, Ont., and have organized this plant especially for the manufacture of sleighs and trucks, and are now working it to full capacity. The Brantford plant will be used to manufacture farm waggons, dump waggons and similar vehicles.

The Eastern Handle & Dowel Co. Ltd., Farm Point, Que., have installed the following equipment: automatic reversible threading and chucking machine, chucking and topping machine, rapid sanding machine, all manufactured by C. W. Smith, Grand Rapids, Mich., and two large and one small Hawker adjustable dowel machines, with trim saw attachment, manufactured by W. S. Hawker Mfg. Co., Dayton, Ohio.

The Goderich Mfg. Co., Goderich, Ont., through J. A. Baechler, the manager, recently purchased several tracts of timber. As this material lies outside the city, it was necessary to secure two large trucks to bring the logs in to the plant. This firm plan on going extensively into the manufacture of boxes and baskets and will remodel their factory in the spring if suitable arrangements can be made with the city council.

It is anticipated that the furniture factory which an English syndicate propose erecting at Marpole, B.C., will be gone ahead with soon. Adverse exchange rates have had a lot to do with the delay in commencing active construction work, for as a representative of the company stated, it would have cost 20% to transfer the capital from England. It is proposed to invest a quarter of a million dollars in the new enterprise.

The Simonds Mfg. Co., of Fitchburg, Mass., have just completed an addition to its Research Laboratory at Lockport, N.Y. The new building is 40 ft. by 50 ft. A considerable amount of new equipment has been installed to enable them to carry on development and research work on a much larger scale. It is expected that new formulas and methods for making special steels will be worked out in the new laboratory under the direction of their experts.

The Port Hope Lumber & Veneer Co., Port Hope, Ont., who recently fitted up to manufacture fruit baskets, are being literally swamped with orders. Among those recently received was one for 8,000 from the Niagara district, 4,000 from St. Davids Ont., 4,000 from Hamilton and many others of like size. The output of the plant is in the neighborhood of 3,200 baskets per day, while the price received is believed to be 15c per basket.

The Bridgewater Shipping Co., Limited, Bridgewater, N.S., have recently purchased from the estate of the late J. F. Beeler, Lequille, N.S., machinery for manufacturing spokes and bent rims. It is the intention to instal this equipment in the Bridgewater plant and turn out a line of waggon spokes and bent rims. The officals of the above company are R. Dawson, president; Dr. W. Trethewey, vice-president; E. Tupper, managing director, and H. S. Barnby, secretary-treasurer.

William Conklin, proprietor of the Conklin Planing Mills, Kingsville, Ont., has bought the lumber business and planing mill of John Fraser, Amherstburg, Ont., who is retiring from business. Charles Wellman, who for many years has been associated with the Windsor Lumber Co. at Windsor, Ont., has been appointed manager of the Amherstburg industry. Mr. Conklin now has four lumber yards at Kingsville, Woodslee, Cottam and Amherstburg.

The officials of the Office Specialty Co., Limited, Newmarket, Ont., manufacturers of desks and office fixtures, recently erected a memorial tablet in honor of the employees of the company who paid the supreme sacrifice in action. The tablet was unveiled by Miss Ruth Dolan, daughter of W. E. Dolan, supervisor of branches. H. C. Slemin, managing director of the company, delivered an appropriate address. Ninety-one employees of this company served under the colors and eight of this number were killed.

Hitch Bros. Co. of Canada, Limited, St. Thomas, Ont., recently installed a plant to manufacture a line of wooden toys. While not completely organized, they are turning out at the present time kiddie horses, kiddie sleighs, bobby horses, Kumfy Kosters, wheel barrows and bag trucks and other similar toys. One of their best sellers is a coaster waggon which is patterned after the common bob sleigh, having wheels instead of runners. They are experiencing a strong demand for their product and expect to work up a large business.

The box makers of B. C. recently made a plea for protection. J. H. McDonald, who represented the box manufacturers, explained that there are 24 box factories in British Columbia, giving employment to 1,500 hands, while 3,000 others are engaged in cutting lumber for this trade. The total value of the boxes produced runs about $7,000,000 annually, and of this amount from 75% to 85% is expended in wages. He asked for a continuation of the present tariff on behalf of the box makers' section of the B. C. branch of the Canadian Manufacturers' Association.

According to reports recently received the piano manufacturing industry has been hit very heavily by the sales tax and the recent increase in freight rates. The immediate future does not appear to be any too bright, although the piano manufacturers are not pessimistic. The commercial credit situation has also affected this industry adversely and will continue to do so until the financial situation is easier. Under present freight tariffs the rate from Calagary to Toronto on an ordinary upright piano is $30.25. This may tend to curtail the amount of business done in western Canada.

The Massey-Harris Co., Limited, Toronto, Ont., contemplate the erection of a large sawmill at Humphrey, Arkansas. This mill will be used to manufacture the timber from a tract of 23,000 acres recently acquired by this firm. In addition to the sawmill, other buildings will be constructed and a number of homes erected for the mill employees. This mill will have a daily capacity of over 75,000 feet and will give employment to about 400 men. The total investment is expected to run up to $500,000. The lumber will be shipped in the rough to Toronto, where it will be turned into their well-known line of agricultural implements.

The Elliott Machinery Co., Limited, Belleville, Ont., are moving their Toronto offices from 111 Adelaide St. East, to 168 King St. East. In the new premises they will have a large showroom and will display their line of combination woodworkers also such individual pieces as the Elliott jig saw, band saw and planer. In addition, a complete stock of spare parts will be carried. This firm is succeeding in working up a large export business. A shipment of 18 combination woodworkers was recently made to South Africa and a smaller shipment consisting of six woodworkers to South America.

The Brantford Pattern Works, 49 George St., Brantford, Ont., have recently branched out and are making a line of wood novelties along with wooden patterns. The novelties manufactured include piano lamps, table lamps, tool chests, forms for reed furniture and turnings of all kinds. They contemplate building a new addition to their factory in the near future. The present plant consists of planer, jointer, band saw, dowel machine, lathes, sanders, trim and combination saw, also a steaming and bending outfit. The proposed building is to be a three-storey factory. The following machines will probably be added:—

One reason why our Gum is Straight and Flat

It *IS* Different

One of our customers to whom we recently made an initial shipment of our KRAETZER-CURED Sap Gum said to us:

"This is different from any Gum lumber I have ever seen."

Of course it is; that's exactly what we have been trying to make everybody understand. It's like another wood. **Better, vastly better.**

Most everybody thinks the Sap part of Gum must be black or discolored. **Let us show you differently.** Our Plain Sap and Quarter Sawn Unselected Gum is as **bright as a dollar,** with a slight pinkish cast, about the color of light cherry.

Of course, the inspection rules say "Stain is no defect," but **what do you say Mr. Manufacturer,** you who have to **cut up, work** and **finish** the lumber?

We do not see how the usual run of Sap Gum, discolored, black and lacking uniformity in color, can be used for the manufacture of furniture, trim, finish, etc. **It is NOT used by manufacturers acquainted with our kind.**

And warp—another unnecessary evil; the result of antiquated methods of production and handling. **Ours is straight and flat—EVERY BOARD OF IT.**

The initial cost is a little more, the final cost very much less and oh! the **satisfaction** resulting from **dependability** and **freedom** from **trouble** and **worry.**

Unscrupulous dealers misrepresent. Do not be deceived. **Insist on the genuine.** Every board bears our trade mark; it stands for the acme of quality and dependability in Hardwoods.

Our protection THE KRAETZER-CURED LUMBER CO. *Your guarantee*

The Kraetzer-Cured Lumber Co.

GENERAL OFFICE: GREENWOOD, MISS.

Why our Gum does not stain

Our Quartered and Plain Red and White Oak, Ash, Hickory, Red Gum and Tupelo is as fine as the highest quality of virgin timbers and thorough knowledge of production can produce. THERE IS NONE BETTER.

band saw, drum sander, shaper, and a number of other smaller pieces of equipment.

It is reported that the plant of the St. Thomas Cabinets, Limited, St. Thomas, Ont., has been taken over by the Canadian Edison Phonographs, Limited, a branch of the Edison Co. of Orange, N. J. This new company has purchased the entire plant and intend installing additional machinery in the near future. They will completely reorganize the plant for the manufacture of phonograph cabinets and the assembling of cabinets and phonograph parts. It is expected that the plant will be in shape to turn out the first Canadian-made Edison phonograph by June 1st, 1921. In connection with this deal, it may be of interest to note that at one time Thomas A. Edison, the head of this company, resided in St. Thomas.

Sir Alexander Maguire, chairman of the Amalagamation of British and Canadian match-making concerns, who intend to establish a five million dollar plant in the vicinity of Quebec, is expected to arrive from England in the course of the present month when the site will be chosen and the work of excavation for the foundations of the factories will be proceeded with. It is admitted that the plant will be located within a radius of ten miles of Quebec City, and the plans for the new industry will practically duplicate a plant recently erected near Liverpool, Eng., which is considered the most up-to-date in the world. The production capacity will be about 100,000 gross a week and the industry will give employment to between two and three thousand hands.

The exhibits made by the North American Furniture Co., Limited, and the Owen Sound Chair Co., Limited, at the Owen Sound Exhibition, attracted considerable attention. These firms succeeded in winning the cup presented to the firms making the best exhibits. One of the newer designs that created much favorable comment was an eight-piece dining-room suite, finished in chrome walnut. This is a new finish which has been placed on the market recently by the above firms. The wood used is birch but it is so treated that it can scarcely be distinguished from walnut even by experts. The attractive appearance of the suite only goes to show what can be done with Canadian woods when intelligently handled. If more Canadian furniture manufacturers were to give greater attention to local woods, it would go a long way to creating a strong demand for furniture made in Canada and from Canadian woods.

The Western Match Co., Limited, which was recently organized with a capital of $200,000, has secured a plant at Neepawa, Man., where they will manufacture matches for the western market. J. D. Mantion, formerly with the E. B. Eddy Co., and the Diamond Match Co., is superintendent of the new plant. Several special machines of his own design are to be operated in the new factory. The matches are to be manufactured under what is known as the "new square match system," the patent rights of which have been secured. Under this method three matches can be cut from a given dimension of lumber as against one match by machines now in use. The new special equipment also has an output three times as great as that of the ordinary type of machine. Another feature is that the matches can be made from green lumber, eliminating the necessity of tying up a large part of the capital in lumber that is being seasoned.

Personals

W. M. Ritter of the W. M. Ritter Lumber Co., Columbus, Ohio, together with F. B. Pryor, sales manager of the company, recently spent a few days in Toronto on business.

H. B. Smith, a well-known furniture manufacturer of Owen Sound, Ont., was recently appointed president of the Halifax Shipyards Limited. This organization is one of the links in the large British Empire Steel Coroporation merger.

Wm. F. Miller, on the staff of the inspectors of the National Hardwood Lumber Association, was recently transferred from Grand Rapids, Mich. to Toronto, Ont., to assist John E. Banks, chief inspector for the Toronto district. Frank Fravelle, assistant to Mr. Banks for some time, recently resigned.

Matthew Brown, of Toronto, Canadian representative of the Thomas Hall Lumber Co., Charleston, W. Va., recently joined the ranks of the benedicts and is receiving the congratulations of his friends in the industry. Mr. Brown was married at St. George's Church, Toronto, on October 2nd, to Mrs. Mary E. Foster, only daughter of the late Rev. Thos. & Mrs. Rixon. Mr. and Mrs. Brown have taken up their residence at 83 Neville Park Boulevard, Balmy Beach, Toronto.

W. R. Youmans, of Toronto, who represents Hunt, Washington & Smith, Nashville, Tenn., reports that his company recently launched a new sawmill at Blakley, Ga., with a cutting capacity of 75,000 feet a day. The principal product cut will be short and long leaf southern pine. The new mill has the latest dressing equipment, drying kilns, and other installations.

A. E. Clark, of Edward Clark & Sons, wholesale lumber dealers, Toronto, was one of a party of prominent business men, paper manufacturers and financiers who were the guests of the Riordon Pulp & Paper Co. and visited the large pulp development at Hawkesbury, N. S., and later spent a day at the Kipawa plant. This latter project represents the last word in equipment and organization.

Robert Bury, president of Robert Bury & Co., Liverpool, England, and Mrs. Bury, are spending a few weeks in Canada. Mr. Bury is visiting a number of the important lumber centres of Ontario and New York State, looking into sources of supply for the coming year. He recently returned to Toronto from spending several days across the border, accompanied by F. M. Thompson, manager of Robert Bury & Co. (Canada). Mr. Bury's many friends are pleased to meet him, as it is four or five years since his last visit to the Dominion.

W. A. Ransom, president of the Gayoso Lumber Co., Memphis, Tenn., whose family have been spending the summer at Port Colborne, Ont., spent a few days in Toronto recently with W. R. Youmans, 933 Queen Street West, Canadian representative of the firm. The Gayoso Lumber Co. are large producers of quarter sawn red gum, plain and quartered oak, poplar, chestnut, etc. Mr. Ransom reports that in the south stocks among the consumers are generally low, but that more inquiries have been coming in lately than for some months past, and many are looking for a stiffening in prices by the 1st of November. The Gayoso Lumber Co. also does a large business in various parts of eastern Canada through Mr. Youmans, who has been calling upon the trade for the past eight years.

Obituary

Arnold Green, of Green Bros., Toronto, interior woodworkers, recently passed away. Mr. Green was fatally injured in an automobile accident.

Harold Walton, superintendent of the Dominion Shipbuilding Co., Toronto, recently visited Port Arthur, Ont. Mr. Walton was at one time connected with the Port Arthur Shipbuilding Co.

The death recently occurred in Toronto of David Rogers, son of the late Chas. Rogers. Mr. Rogers was born in Toronto seventy-two years ago and for the greater part of his life was connected with the firm of Chas. Rogers & Sons, furniture manufacturers and dealers.

L. D. Shafner recently passed away at Annapolis Royal, N. S. Mr. Shafner was a well-known shipbuilder and having been engaged in that business both in Nova Scotia and in British Columbia. During the last few years he was connected with the Annapolis Shipbuilding Co., Annapolis, Royal, N. S.

L. D. Murrelle, president of the L. D. Murrelle Lumber Co., Memphis, Tenn., recently passed away at Denver, Col. Mr. Murrelle, who was only 32 years of age, had been identified with the hardwood lumber industry for a number of years, and, although quite young, he had achieved unusual success in the line he followed.

Wm. Yelland, of Peterboro, Ont., recently passed away. Mr. Yelland was born in England and came to Peterboro in 1850, when he established a carriage factory which he conducted until 1900, when it was taken over by his son, G. H. Yelland. He served in the city council for thirteen years and also one term as mayor. He is survived by three sons, Wm. G. Yelland, of Toronto, and Joseph and Benjamin Yelland of Peterboro.

J. S. Stephenson recently passed away in Peterboro, Ont. Mr. Stephenson was one of the pioneer residents of Peterboro, having been born in that city in 1831. He was a boat builder by trade and early gained an enviable reputation for the excellent boats which he turned out. He also has the unique distinction of having made the first canoe manufactured in Peterboro.

In the Olden Times

IN the olden times the furniture artisan with his square and dividers, first designed, then cut and assembled his creation. This man, who devoted his time to originating and putting together these wonderful pieces, could rightly be called an artist. The making of the beautiful specimens that grew under the hands of such a master, became the life work, into which he put his whole heart and soul. He was proud of the articles he had created, proud of their fine lines, proud of the workmanship that had entered into their production. His was the pride of achievement.

Today, conditions have changed greatly. The manufacture of a single piece of furniture involves the collective effort of many artisans.

The quality and appearance of the present day product, however, depends entirely upon the attention, interest, and workmanship of the individual, just as it did in the olden times, but a mistake to-day of one artisan may throw out the work of several others who are working on parts of that same piece of furniture.

Each operation, although apparently simple, is of the **utmost importance,** and when done perfectly, contributes to **make a perfect article when completed.**

The furniture you are working on to-day is destined to mould and elevate the taste of the Canadian people and to assist them towards Better Furnished Homes and Greater Happiness.

There is your incentive to take a pride in your work—to deserve the name of Craftsman.

Some Factory Dont's

A writer in the Textile World Journal presents the following as a list of don'ts regarding which he says that some of the men he has worked under might have fared better had they been more careful to observe:

Don't give orders direct to the men; tell the foreman; that is one reason you have him there.

Don't measure a man's ability by his talk; make his work count.

Don't build a machine if you can buy one as cheaply; there is likely to be a big difference in their performance.

Don't buy things on the basis of cheapness; they may be expensive in the end.

Don't imagine that two ten-dollar-a-week men are better than one twenty-a-week man.

Don't be unjust if the men have a grievance, adjust it, if possible.

Don't get your workmen all stirred up over trifles; it reduces their efficiency.

Don't take too many of your own or your wife's relations into your employ; the other workmen will not have confidence in them or in you.

Don't permit discord between departments; it retards the efficiency of the plant.

Don't call down your foremen in the presence of the work-people.

Don't discourage suggestions.

Don't forget that the surest way to kill a good suggestion is to make a joke of it.

Don't distrust your employees; if they are not reliable, discharge them.

Don't drive the men to get a job done quickly, and then let it lie around the shop when it is finished.

Don't surround yourself with incompetent people just because they are friends; their friendship may be worth having, but their incompetency may be detrimental to the working of the plant.

Don't have a man work too much overtime; his nervous system will not long be able to stand it.

Don't do away with a thing or a method unless you put something better in its place.

Don't have a poor system of artificial light or of ventilation; it is very poor economy.

Don't fail to supply good drinking water for the employees.

Don't have favorites; neither they nor the workmen will respect you for it.

Don't take credit that belongs to some one else.

Don't be content with cheap labor; the best is the cheapest in the end.

Don't forget that there is more than one side to a story.

Don't hesitate to throw a machine into the scrap heap when its usefulness is gone.

Don't be anything but a man if you want good, faithful, and loyal service from the workers.

Don't accept opinions when facts should be, and can be, shown.

Some cabinet-makers consider that the sanding machine has made more difference in output than any other machine.

Heat Regulation Reduces Accidents

Men and women in the office or shop always work faster and with fewer errors and accidents when the rooms are **automatically maintained at an even temperature.**

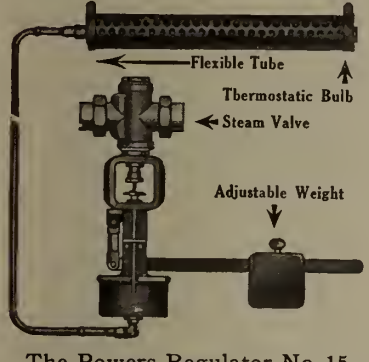
Automatic control on processes involving heat results in a more uniform production with saving of material, fuel, and man power.

This is a worth-while saving in every instance.

Powers Regulators insure that saving.

Let us show you how it is done.

Powers Regulator No. 15



The Powers Regulator No. 15

This regulator is designed for the control of air temperature in drying rooms of all kinds. Prevents use of more heat than is required. Easily installed. Entirely automatic, reliable, and accurate.

Ask for Bulletin 138

Try One in Your Own Factory

Tell us where you have difficulty with uneven temperatures, and we will send you a suitable regulator for trial in your own factory. If you are not satisfied, send it back at our expense.

Upwards of 10,000 Schemes to Provide Housing in Britain

Attempts to solve Great Britain's housing problem have already brought forward upards of 10,000 schemes, involving an annual capital expenditure of $600,000,000, according to a report by a representative of the foreign trade bureau of a Trust Company. After giving details as to various plans and the number of houses to be built in each of more than thirty cities visited, the report continues:

"The programme of the ministry of health—complete rehousing in three years—is about one year behind, and is costing more than double the original estimates.

"The ministry of health works in conjunction with the office of works. When a local authority defaults, the business is then intrusted to the office of works.
